20,417. The settled estates cannot be mortgaged. It is only life interest that would be mortgaged?—But, then as I say, so many charges are on the inheritance. You have terms of years, vested in trustees for the purpose of raising money on the inheritance for the family charges invariably, and also very often for permanent improvements.

Tenants and occupying owners.

20,418. (*Lord Rendel.*) Take the next point; you say that a tenant farmer is in a better position than an occupying owner, seeing that he obtains a portion of his capital from the landlord?—That is my idea.

20,419. The system, I suppose, of letting the land is favourable also in this respect to the landowner, is it not; does it not widen the competition for land?—Yes, I think it does.

20,420. You would be willing to put that on the other side, that the system of letting land to men with inadequate capital to farm it is one favourable to increase the competition for land?—Yes.

20,421. And to that extent it is favourable to a slight increase of rent?—Yes, to a certain extent, of course. It is also favourable to the landlord, and also favourable in that way to the general community.

20,422. So far as a landowner is induced to take the lower interest in the shape of rent on his capital in the shape of land from a consideration of the amenity value of land, its social and political value, so far the tenant gains an advantage?—Yes, I think so.

20,423. And these amenity values dwindling the tenant would lose the advantage, I presume?—I suppose he would; I think that would follow.

Leases.

20,424. You advocate a lease, but you admit that leases are not popular?—Yes.

20,425. I suppose that so far, recognising that a lease is a desirable thing in the interest of agriculture, and that it is not usual on the tenant farming system, that would be favourable to occupying ownership as far as it goes?—I do not quite follow that.

20,426. If you recognise that leases are desirable, but they are not possible, you would, I suppose, admit that an occupying ownership is preferable?—Do you mean if the lease was preferable that therefore occupying ownership would be so too?

20,427. I say if it is in the interest of agriculture that it is desirable that there should be leases, but in the practical working of the system at present there cannot be leases; then to that extent occupying ownership has an advantage from the agricultural point of view, I presume?—I cannot see how it follows at all. The tenant who takes a lease or has a lease granted to him, says, in effect, "If I lay out money on this "land, I can lay it out in such a way, and I will take "care that I do lay it out in such a way as to get a "return within the term of my lease." And that seems to me to be the best method of tenancy that can be adopted. But I do not quite see how it follows that an occupying ownership, as I understand you to say, is desirable.

Mr. S. B. L. Druce.

11 May 1894.

20,428. Not as an advantage from the point of view of agriculture?—Do you mean in this way, that, inasmuch as a lease is an ownership for a term of years, and the person who has the lease is the occupier, that therefore if you extend that in perpetuity and so make the lease become a fee simple and the occupier continue, it logically follows that the occupying owner must be in the most desirable agricultural position; is that it?

20,429. You are more ingenious than I am; I am treating these remarks in apologia for the existing system; that is to say, for the tenant farming system, and I wish to discover whether you recognise certain drawbacks. You admit that from the agricultural standpoint leases are desirable?—Yes.

20,430. You also admit that leases are not possible owing to the distaste for them on a broad scale. I then ask you that therefore, from the agricultural standpoint, occupying ownership has an advantage?—No.

20,431. You do not admit that?—No.

20,432. You do not see that the value which the lease system gives in tenancy is represented necessarily in an occupying ownership, and, therefore, if you lose that advantage in tenancy you give the advantage to the occupying ownership?—No, I cannot follow that.

Law of distress.

20,433. One question only upon distress. Is it not true of distress, that as it gives the priority and a special security for the landlord's debt, that it widens the competition for farms?—I think we must admit that it does widen the competition for farms.

20,434. I will not say in these days, but in more prosperous times would you not regard somewhat anxiously the extreme competition for farms?—Undoubtedly in the good times the extreme competition for farms did harm. That was one of the strong arguments used in the early days—I call them early, 12 or 15 years ago—when the subject was first brought before my notice of the abolition of the law of distress.

20,435. You recognise a very great depletion of farming capital at the present day?—I am sorry to say I do.

20,436. (*Mr. Clay.*) Was not it the enforced competition which the law of distraint produced which forced up the rents?—It is rather difficult to say. I do not think that it is fair to say that it forced up the rents. I do not think it was the law of distress that did that, but rather the great prosperity of the country, and the fact that so many people who knew nothing about farming, tradesmen and others, tried to get farms, because it was thought to be a comfortable and easy life.

20,437. I thought the law of distress has forced up the competition?—I do not think that it was caused by the law of distress.

20,438. (*Captain Owen Thomas.*) Was it not an inducement to men with no capital to begin farming?—It may have been an inducement to men who had not sufficient capital to begin farming—I must admit that.

20,439. (*Viscount Cobham.*) But it was not a main factor?—It was not a main factor.

Tribunal for fixing rent.

20,440. (*Lord Rendel.*) Your wide experience makes you strongly of opinion that the settlement of rent itself should be left between the landlord and tenant?—Just so.

20,441. But you recognise that there may be parts of the United Kingdom where the land hunger, the competition for the occupation of land is so great as to make you hesitate to form an opinion in respect to such localities?—Where the land hunger is very great it can be no hardship upon the tenant, the person hungering for the land, to keep it if he pays a high rent; he gets that which he wants, and he is willing to pay for it.

20,442. Then you regard the rent of a farm as the price which a man is willing to pay for it?—Certainly.

20,443. And in no sense as to the value of the land from the agricultural point of view?—I think it is the

Mr. S. B. L. Druce. 11 May 1894.

value which the man who takes the land considers that the land is worth to him, whether from an agricultural or residential, or sporting, or other point of view.

20,444. But land hunger generally implies something more, does it not, than an economical consideration of the value of land?—Yes, I think it does.

20,445. And therefore in such a case rent might include something more than the economical value of the land?—Yes; but if a man to gratify his own wishes or sentiments, for some sentimental reason wishes to get hold of a piece of land, the value of that land to him is the economical, plus the sentimental, and he must pay the economical plus the sentimental value. I fail to see any hardship upon that man.

20,446. As you are stating the sentiment, the sentiment is a luxury?—Undoubtedly, the land hunger that one hears and reads of is a luxury.

20,447. As a matter of fact it might not always be a luxury; it might be something more than a luxury?—It is a luxury to the individual.

20,448. It might be the price of existence in some cases?—Then agricultural and economical value at once go if it is the price of existence.

20,449. Might not the occupation of land be in many parts of the United Kingdom a necessary adjunct of some trade or calling with which the landlord had nothing to do, but which was the price of existence of the tenant?—That would be an economical value to the tenant.

20,450. With which the landlord had nothing to do?—Then the would-be tenant must pay that, that would would be the economical value to that tenant.

20,451. At any rate you would define rent as being the price which any man is willing to pay to a landowner for the occupation of his land?—Yes, I think that is right; I do not like to be tied down to a hard and fast definition, but I think I can agree to that.

Mr. S. B. L. Druce. 11 May 1894.

20,452. You would not be willing to see the question of that price in any way determined by a third or outside party?—No.

20,453. On the other hand, with regard to compensation for improvements you would have a third party introduced?—Yes, that must be so, you must have a third party there because you have to determine what is to be paid for.

20,454. You are not unwilling that there should be intervention of an arbitrary kind, not determined by the landlord or by the tenant, but appointed independently for the determination of questions of compensation in connection with land?—If they cannot agree amongst themselves.

20,455. But you draw the line at rent?—Yes, I draw the line at rent. It seems to me to be on a totally different basis.

20,456. (*Viscount Cobham.*) Have you ever heard of a man wishing to become a small occupying farmer buying a small estate and giving an extravagant sum for it?—Yes, many a one.

20,457. Have you ever heard it suggested that there should be a land court restraining such transactions?—Yes.

20,458. Restraining the buying of land?—I have heard of such things.

20,459. Do you think that that would stand very much on the same footing as a land court restraining persons from offering an extravagant sum for the occupation of land?—Certainly. Very much on the same footing.

The witness withdrew.

Adjourned to Thursday, the 24th inst.

Thirty-eighth Day.

Thursday, 24th May 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary*.
R. T. CRAWFORD, Esq., *Assistant Secretary*.

Mr. W. Lipscomb. 24 May 1894.

Mr. WILLIAM LIPSCOMB called and examined.

Mr. W. Lipscomb. 24 May 1894.

20,460. (*Chairman.*) I believe you reside at Heath near Wakefield, in Yorkshire?—Yes.

20,461. You have been agent for the Savile estates in Yorkshire for a great number of years?—Upwards of 40.

20,462. You have either been President or Vice-President of the West Riding Chamber of Agriculture for the last 20 years?—Yes.

20,463. You are also a member of the Technical Instruction Committee of the County Council of Yorkshire and of the Agricultural Committee of the Yorkshire College?—Yes.

20,464. And you have been one of the Council of the Central Chamber of Agriculture for the last 20 years and have served on the committees appointed to consider Tenant Right questions, acting as chairman on the last two occasions?—Yes.

20,465. You are, therefore, thoroughly familiar with all questions affecting the Agricultural Holdings Act and the subject of Tenant Right?—Yes.

20,466. Will you hand in a report which has been presented by the committee appointed last February by the Central Chamber to consider what amendments are desirable in the Agricultural Holdings Act?—I believe you have already had copies.

The Agricultural Holdings Act.

20,467. Without going into the full detail of this report will you state the main conclusions the Committee have arrived at?—I may begin by saying that the prevalent idea of the men with whom I have been acting principally is that it is more desirable to amend than to abolish the Act in consequence of its having been so very largely introduced into agreements throughout the country—far more than the public are aware. Our first recommendation has reference to the initial clause in the Act with regard

"The inherent capabilities of the soil."

Mr. W. Lipscomb.

24 May 1894.

to the proviso affecting the inherent capabilities of the soil. You will see appended to the report a great number of suggestions from different parts of the kingdom where the affiliated chambers exist. We found that a great portion of these chambers recommended the abolition of that proviso.

20,468. I presume that your own opinion coincided with this report?—It does; I think that on the whole I may support every portion of it. I think I am familiar with the cause of the introduction of that proviso. The Act of 1883 substituted I might say rather an academic mode of valuation for the fixed basis of the Act of 1875. It was provided that the valuers were not to take into account what was due to the inherent capabilities of the soil. I believe practically that it has not at all safeguarded the interests of the landowner or of the incoming tenant, but that it has afforded an opportunity of cavilling at the Act unfairly. It was suggested by many that it operated injuriously to the outgoing tenant, whereas I believe it was inoperative and hence I concurred myself in removing what was a bone of contention.

20,469. I understand you do not object in principle to it, but you think that in practice it has operated ill?—It is stated to have operated ill, but I do not think it has operated at all myself. I believe it has been inoperative but it is constantly asserted by persons, who perhaps know more theoretically than practically, that it has operated as against the outgoing tenant. Therefore my own opinion was that as we received so very many suggestions from the provincial chambers it should be removed, that it was better to comply with their requirement.

20,470. (*Viscount Cobham.*) Do you consider that it is inoperative because it is superfluous?—It is not superfluous, if you take the concurrent words of the clause which left no guide to the valuer. The valuers must have a guide and although you have removed the basis they still go upon it.

The schedules: Parts I. and II.

20,471. (*Chairman.*) What is the next point to which you wish to draw attention?—The next part is the schedules, which of course have a very material bearing upon every valuation under the Act.

20,472. What are the main alterations that the Committee recommend, we need not go into all the details but there are certain principal topics which you might take?—There is a very good synopsis of the recommendations in the "Land Agents' Record" and it is rather brief. The principal alteration is removing from Part I. that which has been so enormously increased, namely, the laying down to permanent pasture; that is removed to Part II. and put upon the same footing as drainage. If you will kindly look at the schedules in the Act itself it will be more easy to see how it is proposed to alter them.

20,473. In the Act there is only one subject in Part II. of the Schedule, namely, drainage?—Yes, it is only drainage.

20,474. And you propose that several additions should be made to Part II.?—Yes.

20,475. Namely the improving of roads, the improving of watercourses, wells or reservoirs, the laying down of permanent pasture, the making of gardens (not exceeding one acre) the planting of orchards or fruit bushes—?—Not exceeding one acre—that is very material.

20,476. The making and planting of ozier beds also not exceeding one acre, and the reclaiming of enclosed waste land?—Yes, you will see that in Part I. we still retain some of these items which are enumerated. It is proposed to allow the tenant to plant orchards or to make gardens or ozier beds not exceeding an acre, because very often it is found in practice that a man wishes to extend one or the other. Half an acre was one proposal, but then it was thought better to propose that it should be one acre. So with regard to improvements; that is a very important alteration in effect. We do not propose to transfer the entire making of new things, but that there ought to be the power of improving roads for instance. We do not propose to remove the making of roads or bridges from No. (7) in Part I., but we take out the word "improving" and put it into Part II. so that the tenant may improve by giving notice and not be obliged to wait for the consent of the landlord before he does that. I think that will commend itself to your minds.

20,477. The effect of that will be that all these improvements could be effected by the tenant if he has given three months notice to the landlord, during which time the landlord can undertake to execute the work himself?—Yes.

20,478. And then, if he does not adopt that course the tenant can make the improvement and claim compensation under the Act?—Yes.

Mr. W. Lipscomb.

24 May 1894.

20,479. In the same way that he does now for drainage?—Yes.

Drainage under the Act.

20,480. Do you know whether the Act has been much availed of in respect of drainage in that way?—I think it has operated in this way that it has made landlords more active in draining; I was, I believe, almost the first to advocate that drainage should not require the assent of the landlord, because it is so absolutely essential in the initial improvement of the land. I am going back to the draft Bill of 1875 now.

20,481. Then the main effect of the existing Act as regards drainage has been that tenants have given notice to their landlords and the landlords have then executed the drainage themselves; not that the tenants have effected the drainage after notice; is that so?—Some have.

20,482. Some have?—Some distinctly have.

20,483. The main effect has been to bring it prominently to the notice of the landlord that drainage is required and the landlord has then availed himself of the option of doing it himself?—Yes.

20,484. Therefore it has enabled a gentle pressure to be brought to bear upon the landlord to effect it?—Yes; it has operated both ways.

20,485. Do you consider that that would be the probable effect of introducing these other items into Schedule 2, or would the tenants do them?—Unquestionably. As I dare say you are aware the very worst *vis* is *vis inertiæ*. The tenant does not get an answer to his requirements very often: he asks for the consent over and over again and he does not get an answer.

20,486. As with lawyers?—I am sorry to say that is not confined to lawyers. But in such a thing as drainage it is conceded that it is essential that it should be done. The main alteration the committee propose, you will observe, is in regard to laying down to permanent pasture. That is brought about by the low prices of corn. As we know by statistics in all parts of the country men are laying down to grass, and it is a necessity. This change in the 10 years has rendered the proposed alteration politic. It was not so obvious in 1883, but I think now that the laying down of permanent pasture is so essential that a man ought to be able to do it after giving due notice. If he cannot get the consent of the landlord to help him in doing it upon a basis of mutual agreement, he ought not to be precluded because he does not get an answer.

20,487. That is a case where, I presume, you would consider the tenant would almost certainly do it himself?—Yes, and he usually does.

Schedule III.

20,488. What alterations do the Committee propose in Part III.?—Two items have been very considerably discussed ever since the Tenant Right Acts were brought in; one a minor one, with regard to horses. The cause of its not having been put into the Act originally was the fact that horses are greatly on the roads—I am speaking now of the consumption by horses of food stuffs—that their manure, therefore, did not reach the manure pit, and that consequently it was not fair to tax the incoming tenant. The majority of the Committee considered that we should put in words which would make it only applicable to horses which may be considered were entirely engaged on the holdings, and not engaged, as in the West Riding is so common, in coal leading or doing odd jobs for neighbours. The majority were of opinion that horses entirely engaged on the holding ought not to be excluded in taking into account what the value of the manure was. Then the other point was one which, of course, everybody is aware, has been a vexed question for a very long time; that is, as to home-grown corn. I may say that I am a convert myself by the change of circumstances since 1883. We all know now the miserable price of all the lower orders of grain. Unless it is very first-class grain the best mode of dealing with it is to consume, at least, a large proportion of it on the holding. A change has taken place in that way. If we had been told 20 years ago that we should consume our wheat at home it would have been considered a very far-fetched idea; but it has now practically become a most common practice with a large number to feed at home. We have to deal with that. I know that in the opinion of many most experienced valuers there would be very great difficulty in valuing what had been done; but let the *onus probandi* lie with the claimant. A good umpire would satisfy himself before he allowed the claim. We think that it ought to be allowed with the reservation that proper vouchers should be produced.

Compensation for consumption of home-grown corn.

Mr. W. Lipscomb.

24 May 1894.

20,489. You said that you had been converted by the change of circumstances during the last 20 years?—Yes.

20,490. Then I understand from that that 20 years ago you were of a different opinion?—I think I might say that three-fourths of the Central Chamber, who drew up the original draft which led to the Act of 1875, were of the opinion that it was not desirable to introduce it; but since then, as you are aware, these prices have tumbled down so as to cause a different system. That is the whole secret.

20,491. (*Viscount Cobham.*) You said proper vouchers should be produced. What vouchers could be given?—If you ask me what they can be, I say, it would be for the off-going tenant to see. I do not attach very much importance to it myself. The value according to our scale in a former report, which I should like to put in presently, would only be one-sixth for corn, and it would only be for the last year. Therefore the claim would not be excessive, and it would be for the man himself to see that he so manipulated his claim as to make it available before an umpire. What I should do myself, if I were a tenant, would be to give notice to the agent that I was going to make my claim and to give him the opportunity of checking that a proportion of my growth was so consumed.

20,492. If you limit it to one year of course the difficulty would be small?—It would be limited to one year. I do not think Sir John Lawes, whose tables are certainly unapproachable by any others, would say that horse corn could be looked upon except for one year. So that I do not myself regard the question as of that paramount importance that some people do.

20,493. (*Chairman.*) You spoke of one-sixth, but I did not quite understand what you meant?—Directly the Act was passed in 1883 a committee was appointed to consider the basis upon which the valuation ought to be made and there was complete agreement as to the valuation in respect of items which comprised feeding stuffs, but there was not such a complete agreement as regards manures as led us to make a proposal. On this committee we took our information from Sir John Lawes.

20,494. Do you mean that the outgoing tenant should recover one-sixth in value of the corn consumed during the last year of his tenancy?—That was the recommendation made, that that was the manurial value left. Our estimates were mainly formed upon Sir John Lawes' experiments which he has made public.

20,495. (*Mr. Channing.*) May I ask whether several of the Chambers did not recommend that the preceding year should also have compensation, and whether in some cases they did not put it at one-sixth of the amount for the preceding year as well as for the last year of the tenancy?—As you are aware, I could not possibly go into the various suggestions coming from all over the kingdom. I have come to the concrete result made by the Committee; I cannot go further than that.

20,496. (*Mr. Little.*) These I take it were only suggestions which were not binding upon any valuer, they did not affect the Act?—Not at all.

20,497. No umpire would be bound by these suggestions?—I remember the question whether they would be binding being put to Mr. Chaplin, who was our chairman on that occasion. His answer was this: what we have done is in order to be a recommendation to everybody, either landlord or tenant, if they want a basis which shall be indisputable.

20,498. I beg your pardon; I understand it is for insertion in an agreement?—I am speaking of that. He said that it would be a guide to valuers for both landlords and tenants in arriving at a basis rather than having it entirely open until the tenancy expired.

20,499. You are dealing with a substituted agreement?—I am entirely. His answer was that if they went before any judge in the kingdom with an agreement containing this recommendation he could not imagine its being disputed as a fair substitute when backed by such a recommendation.

20,500. (*Chairman.*) Is it proposed that that basis should be laid down by law, or no?—I should like to see one universal law applying to the kingdom. I am not in the least degree of the opinion that various counties must have different modes of arriving at a valuation. I have a fair knowledge of the kingdom, that is of a great number of counties, and I have never seen the smallest reason for supposing that linseed cake for instance, which is the commonest item in feeding stuffs should be varied from John O'Groats to Land's End, but I am afraid that valuers are a very difficult tribe to get out of a local rut. Our object was upon the highest possible authority, namely Sir John Lawes and others, and upon the recommendation of practical men, to put such a basis as everybody might put into their agreements. I put this verbatim into the agreements that I make.

Mr. W. Lipscomb.

24 May 1894.

20,501. What other changes do you propose in Part III.?—We have recommended that "two years and older "seeds if a good plant, and the land clean and in good "heart," should be inserted. You will see that in our recommendation (32). I think that is a very proper item, sometimes without being what you might call permanent pasture a man has laid down seeds, he finds them answer, and for two or three years they are allowed to remain. The present arrangement is not sufficient and there ought to be a larger valuation.

Suggested addition to Schedule III.

20,502. That is a new item, is it not?—Yes.

20,503. The next clause is, "Increased fertility of the "holding, due to continuous good farming." What have you to say on that?—On that head we have received a good many suggestions from some of the best farmers that are attached to the Central Chamber. Another mode of arriving at continuous good farming was, I remember, made by Mr. Bell, and the Chamber he represented, the Newcastle Farmers' Club, some years ago; that was, that the valuation of every farm should be put under one of three heads: the first, high farming; the second, moderate; and the third, bad; therefore, if it was determined that the farm in question was put under No. 1, the scale of remuneration all through would be of a higher class. I think that was an admirable suggestion. Everybody who knew Mr. Bell knew that he was one of the most practical men in the kingdom, and a very shrewd man too. We considered that in the committee which had all these suggestions before them, but it was not carried out. Now it has been brought before us again and pressed very much that, in addition to those claims which we have already had before us, there should be a distinct valuation for increased fertility of the holding by continuous good farming. I do not see how it can be done except by adopting Mr. Bell's suggestion of a higher scale throughout.

Compensation for continuous good farming.

20,504. What are the three scales; first, high farming?—Yes, you will find all that in the original report.

20,505. Perhaps you will put in whatever is material of that report?—Yes, I will do so.

20,506. This committee did not adopt that recommendation, I understand?—No. Might I read just a single clause, it will be only four lines, of the Report of the Basis of Valuation Committee, which I propose to put in? I am quite sure that would be of service.

20,507. (*Mr. Chaplin.*) What clause is that?—It is in a report which you will remember, as you were chairman at the time, Directly the Act of 1883 was passed, a committee was appointed to report upon the basis of valuation, principally on the custom of Lincolnshire and the West Riding. That report states this—and it has reference to the Newcastle recommendation—"Two modes of estimating "deductions due in respect of deterioration caused by "weed growth or waste of manure have come before us; "one to consider how each item is affected; the other to "adopt the classification of holdings by which every "claim is at once graduated under a distinct standard." That is the reference we make to it, and then we published *in extenso* the recommendation of the Newcastle Farmers' Club as an appendix. If I put in the whole of this you would find in the appendix the recommendation of the Newcastle Club.

20,508. (*Chairman.*) Has this proposal of giving compensation for the increased fertility of the holding due to continuous good farming been adopted in any existing agreements, or no?—It has only been made this month.

20,509. I mean is it based upon any practice or any existing agreements?—No; it is a claim which I may say has never been really focussed before this inquiry, and it has not yet been adopted by the Central Chamber. It is to come on on the 5th June, but the report having been made, I have put it in. It has never, I think, been really practically dealt with before.

20,510. And it is not based upon any practice or any existing agreements?—It is not.

20,511. You stated just now there was some other matter that you had incorporated in recent agreements which you had made as agent?—Yes.

20,512. You have not done that in respect of this?—No, that was only as to the basis of the Act of 1883.

20,513. (*Mr. Channing.*) I think I ought to tell you that Mr. Rowlandson has given evidence on this point?—Some of our best men—and certainly Mr. Rowlandson is one of our best men—in dealing with these customs have

Mr. Lipscomb.

24 May 1894.

stated that they think the high farmer ought to be compensated on a different scale to the man who may have made a spurt in the last two years so as to have a claim under these heads. That is really the basis of the whole thing, but it is a difficult thing to arrive at how to do it.

20,514. (*Chairman.*) The next item apparently is an addition: "Any other improvement increasing the value "of the holding as an agricultural holding and not "specifically mentioned in this schedule for which the "tenant is not otherwise compensated"?—Yes, that was put in so as not to exclude anything.

Scheduling the condition of a holding.

20,515. That is relating to any matter *in pari materia*?—Quite so, I suspect that it will be very difficult to introduce anything else that is not here. It is to cover everything. There is a compensating clause you will find in the Deterioration Schedule which the landlord is to be entitled to.

20,516. Then I see the committee further recommend that there should be a record of the condition of the holding?—That has been most strongly urged by some of the best valuers we have had to deal with.

20,517. That recommendation is to the effect: "(1) "That on the face of every award in the case of a quitting "tenant there shall be a record in a scheduled form of the "general condition of the holding. (2) That in the case "of no award a record shall be made either by the land-"lord and entering tenant themselves, or by a valuer or "valuers; and that such record shall be in duplicate or "accessible to both landlord and tenant and signed by all "parties making the record." Would the expense of that be serious or no?—I think not. A valuer who does his work must go through the farm, and it would be a very short note. My difficulty is how to make it compulsory where there is no award. Mr. Rowlandson stated that there were a great many cases where there was no award. That is not my experience, but I have never acted as a valuer, therefore I will not speak to that. I have always had to pay something to every outgoing tenant, that is all I know. Therefore I think that it might be made compulsory that upon the face of every award a record should be made. To have it on record would be much more satisfactory than vague assertions of what a man found when he came in a dozen years before.

20,518. This record would be a record field by field of the actual condition of the farm?—Yes. There is generally a schedule of the fields to every agreement and a short note opposite it. That is my habit universally. I have every farm inspected every year to know what the cropping is. I think it would be very easy to state that a certain field was in a very exhausted and foul condition, or in a good state of cultivation. It would require but few words, and I think it might be done. At any rate the recommendation is backed by such very good men that I cannot but hope it may be carried out.

20,519. It would seem easy enough to provide for a case where there is a landlord and a tenant, and where the out-going tenant makes a claim and there is an award; but the difficulty is where there is no such claim, is it not?—Yes.

20,520. That is where a tenancy begins without a previous claim?—Yes, without any claim.

20,521. (*Mr. Little.*) I suppose there is always something passing from the out-going tenant that has to be valued?—I said so, but Mr. Rowlandson said, as Mr. Chaplin heard, that he knew several cases to the contrary, I was very much astonished to hear it. Where there is an award you would require a receipt. I think you can certainly make it compulsory where there is a receipt.

20,522. (*Chairman.*) I was putting the possibility where there is no award; I put the case of the landlord letting his own farm?—He would get an award there; he is sure to make some claim; in fact he must do so unless it is a grass farm. No in-coming tenant would expect to enter a home farm and pay nothing unless—and, of course, I have known such a thing—he chose to enter without paying and to go away without being paid. I think the cases of exception are so few that if the recommendation under this head was made compulsory we should be able to deal with nine-tenths.

20,523. (*Mr. Channing.*) Can it be made a compulsory part of the agreement where there is no compensation?—Yes, it might be.

Compensation for dilapidations.

20,524. (*Chairman.*) Then with regard to the compensation to landlords for dilapidations is there any alteration proposed?—You will observe that we propose a schedule. The landlord in the Act is not bound under any schedule, and the complaint was that on the other hand the tenant was bound by a schedule.

Mr. W. Lipscomb.

24 May 1894.

20,525. You propose, then, to schedule the possible claims for dilapidations as against the out-going tenant in the same way as the Act now schedules the out-going tenants claims?—Precisely. It was a universal complaint that the landlord had, both as to time and as to the nature of his claims, an advantage over the tenant.

Claims and counter-claims.

20,526. Then with regard to the notice of claims what is the suggestion made by the committee?—The second allegation made to us was that the period within which the landlord could make his counter-claim was also handicapping the tenant. I may say that almost every suggestion that we received had some reference to that and the other point I have just mentioned. I think the committee were almost universal in recommending that the two claims should be put in on the same day. They also recommend that the period within which the dilapidations should extend should be two years instead of four.

20,527. Are there any other important recommendations you wish to draw our attention to?—I ought to say that the committee were also of opinion, I believe universally, without exception, that the landlord ought to retain the present period for making any claim for dilapidation as to buildings which had occurred after the notice had been given, because a tenant going away in removing his fixtures and so forth might do a good deal of damage which could only be ascertained on his removal. Therefore 14 days should be left to the landlord to amend his claim in respect of the dilapidation to buildings occurring after the notice of claim has been delivered; but he must make his claim on the same day as the tenant with respect to the land.

Compensation for dilapidations.

20,528. (*Mr. Channing.*) The 10th sub-section, under the heading "Compensation to landlord for dilapidations," proposes to give the tenant a right which he has not under the existing law to sell off if he gives security, that an equivalent manurial value will be brought on the holding; it recommends an alteration in the law to that extent, I believe?—It is considered, I believe, universally, that where nothing has been brought back as a substitute for those items which are enumerated, and which are removed off the farm they would be considered as set-offs against the tenants claim. What we have stated here is that he need not obtain the written consent if he has given previous security that equivalent manurial value has been or will be brought on to the holding, and, if required, vouchers for the same are produced at the next audit, provided that no removal of hay, straw, roots or green crops, being the last years' produce, shall take place except with the written consent of the landlord. That is the only alteration; it is not that the whole consent is dispensed with, if the tenant does not wish to have it brought against him, but that he must have either got the consent or given security that there shall be an adequate return of manures.

20,529. My question is that giving the tenant his right to sell off if he gives security that he will place upon the farm an equivalent manurial value is an alteration of the existing Agricultural Holdings Act?—It is a qualification of it.

20,530. (*Mr. Lambert.*) Do you think it is a desirable alteration?—I do.

Valuers and umpires.

20,531. (*Chairman.*) Then with regard to the selection of valuers and umpires?—Which is the most important of all if we can get it.

20,532. Are you yourself of the opinion that the complaints made against the Act are largely due to its faulty administration by valuers?—I am perfectly confident of it. I scarcely ever meet a valuer who is acquainted with the provisions of the Act.

20,533. Do you think that no Act can be made effectual unless umpires of good standing who are really fully acquainted with the Act are available?—That is the most important of all.

20,534. (*Mr Chaplin.*) Are there not such umpires to be found: most of the valuers who now conduct valuations are men of high standing and practice are they not?—No: a great number,—a vast number—are not. Wherever small holdings exist small valuers exist.

20,535. In the case of large holdings does that observation hold good equally?—No, I think the larger the holding the better the man selected.

20,536. In those cases there are a great number of valuers of high standing?—Yes.

20,537. (*Chairman.*) I presume that the Committee of the Chamber of Agriculture is of the same opinion with yourself upon that point?—Yes; it was very carefully weighed how to obtain men of the best standing as umpires under the approval of the Board of Agriculture so that they, holding a certificate from the Board, should be

Mr. W. Lipscomb.

24 May 1894.

immediately available on any question of difference arising.

20,538. And that only those who had the certificate of the Board of Agriculture should be entitled to be employed as umpires?—Quite so.

20,539. But not, of course, as valuers?—We cannot pretend to deal with valuers nor prevent a man from taking a valuer, but we think an opportunity should be afforded to either side immediately to call in the umpire who is to be nominated before proceeding to business—and I should like to emphasize that—I constantly find that valuers meet and do not comply with the requirement of the Act of appointing an umpire before they proceed to business. I think we have suggested a hint which might be adopted, that if valuers have so failed to comply with the Act they shall not be entitled to claim their costs. It is a very easy thing for them to agree before they begin. I think that suggestion is a very valuable one.

20,540. At present the practice is for each party to appoint a valuer, and then for the two valuers to appoint an umpire?—Yes, and they are supposed to do that under the Act, and by most agreements, before they proceed to business.

20,541. Is it the almost invariable practice for the two valuers to appoint an umpire, or do they sometimes agree without an umpire?—They very frequently agree.

20,542. Is it only in exceptional cases that the umpire is appointed?—No.

20,543. In what proportion of cases is it?—I should think—but it is a mere guess—that in very nearly half the umpire is called in; but there is an inordinate delay because they have not appointed the umpire before they differed. These delays are most injurious; they are costly, and nobody gains anything but the valuers. It is a great inconvenience to all concerned. I have waited six months sometimes, and so has the unfortunate off-going tenant before he could get his money.

20,544. (*Viscount Cobham.*) In consequence of applications for postponements?—Yes; all because they have not appointed the umpire first.

20,545. (*Chairman.*) In those cases where the umpire is appointed there are practically three persons engaged who have to be paid—the valuer on each side and the umpire?—That would be so; but what I look to is this, whichever side is inordinate in its claim would immediately be met by having an umpire who would supersede him.

20,546. Do you think if there was a body of official umpires, certificated by the Board of Agriculture, they would be brought in without the necessity of having valuers?—Frequently. The first meeting would be merely formal. I am sure I should recommend it in every case almost.

20,547. Then you would dispense with two out of the three paid persons in that case?—Yes, except at the formal meeting.

20,548. Do you consider that on questions of fact and of value there should be no appeal from the award of the umpire?—That is so.

20,549. That only on questions of law there might be an appeal to the judge of the county court?—Yes.

20,550. Are there any other important recommendations—we need not go into the minor ones?—In regard to the service of the notice we thought that a registered letter ought to be sufficient proof.

20,551. Now you have been agent to the Savile estates, you said, for 40 years; those estates comprise about 16,000 acres of land, I think?—Yes.

Small holdings on the Savile estates.

20,552. And are held by a considerable number of small tenants?—Yes, 10,000 acres of them are.

20,553. Ten thousand acres out of the 16,000; what do the small holdings average?—On the table I sent to the Secretary I see 10,848 acres is the acreage put down, and that the average size of the holdings is 16 acres. The table embraces some few of the larger holdings. I may say that I gave those particulars to Mr. Bear for use in his pamphlet.

20,554. From a statement made by Mr. Bear, who seems to have investigated the matter, it appears that out of 10,848 acres there are 392 holdings under five acres; 139 from 5 to less than 20 acres; 88 of 20 to 50 acres; 39 of 50 to 100 acres; and 24 over 100 acres?—Yes.

20,555. I suppose that in the case of a large number of those, the tenants do not live wholly by the land?—Not a large number, but I suppose there is scarcely any county in England which has more men who do live upon small holdings than the West Riding.

Mr. W. Lipscomb.

24 May 1894.

20,556. (*Viscount Cobham.*) Are they suburban holdings for the most part?—No, they are very frequently moorland farms.

20,557. (*Chairman.*) With rights of common over the moor?—Yes.

20,558. Has that been partly the reason of their answering that the tenants have rights of common?—No, I cannot say that it has, because I am sorry to say that the last men who succumbed to the prices were the sheep-farmers who had sheep runs in connexion with their holdings. Many of them now have ceased to keep sheep. There was first the miserable price of wool and then when the fluke came in so severely there was the depreciated price for sheep of a poor quality (which moorland sheep generally are) and that prevented many of the farmers from going on sheep keeping, but it did not prevent them from going on with their ordinary occupation, which was dairying and the raising of young stock.

20,559. Could the young stock go upon the commons and the moor?—Very few.

20,560. Or the cows?—Very few horned stock comparatively go, they are principally sheep runs.

20,561. What is about the average rent paid?—It is extremely difficult in a country such as the West Riding where you have got very high class land adjoining towns, and a large acreage adjoining moorlands at a great distance from towns, to give an average that would not be misleading, but I think Mr. Bear gives you those particulars, I gave them to him as nearly as I could.

20,562. Apparently, from Mr. Bear, the small holdings average about 30*s.* an acre for rent where they are grass farms, and on those which are arable the rents appear to be about 25*s.* an acre, but on holdings of larger size the rents appear to be 20*s.* an acre?—I am not quite sure of the date of that pamphlet. I am sorry to say rents are still falling.

20,563. Mr. Bear adds that "an occupier of 30 acres or "more, it is said, can get a living on his holding." That would appear to indicate that below that a tenant could not live wholly by his holding?—No, he generally has some help in the way of his children being engaged in some occupation.

Reduction of rent.

20,564. Has there been much reduction of rent of late years?—There has been about 25 per cent. reduction since the depression set in.

Changes of tenancy.

20,565. Have there been many changes of tenancy?—I am happy to say, I think, as few as in any part of England, due to the constant and increasing outlay by the landlord with a decreasing rent.

Landlord's outlay.

20,566. Outlay in drainage and in buildings?—In buildings and improvements of all sorts, principally buildings, water supplies, and drainage.

Difficulty in letting.

20,567. Where any of these holdings are vacant, can you find tenants for them?—For the first time I have advertised in every direction two holdings, which, of course, are small, one of 40*l.* a year and the other of 80*l.*, and I cannot let them at all, and they are in the neighbourhood of good roads.

20,568. (*Viscount Cobham.*) Are they moorland farms?—Yes, they are near the moorland; they are entirely grass I mean, they are above where corn is grown. Roughly speaking you cannot grow corn beyond a thousand feet above the sea with us.

20,569. (*Chairman.*) How long have they been untenanted?—Only a year; it is only within the last 12 months I have been unable to let them.

20,570. Up to that were you able to let any farms when vacant?—Yes; the tenantry as a whole have been very long seated upon the estate, and I have never attempted to put holdings together; I have done my very best to keep them on their legs.

20,571. Are you agent for Lord Savile's property in Nottinghamshire as well?—I am only the inspector of woods; I have a considerable experience of woodlands.

20,572. But you are not agent for the estate there?—No.

Change in system of cultivation.

20,573. Has there been much change in the cultivation of the land in the district?—The principal element is what I have referred to, and that is universal, namely the increased laying down to grass in the arable district.

Mr. W. Lipscomb.

24 May 1894.

20,574. Has there been much land reclaimed of late?—No.

20,575. Would you say none at all?—None at all.

Reduced labour.

20,576. Has there been a smaller employment of labour on these holdings?—Distinctly; I am afraid there is no exception in England there.

20,577. Speaking of your own district specially, has there been a smaller employment?—Yes.

20,578. Is that coincident with the laying down of land to grass?—It is concurrent with it. The first bill that is cut down is the labour bill. I do not know any indication which is so apparent to the passer-by as the condition of fencing. The fences of England have deteriorated most grievously in the last 20 years.

20,579. I am speaking of your own property?—Yes, and I am speaking of that. The fencing everywhere is becoming neglected to a most serious extent.

Highways.

20,580. What suggestions have you to make with regard to remedies other than those you have made with regard to the Agricultural Holdings Act?—The alleviation of taxation practically might be best made in my opinion by the roads being entirely taken over by the County Councils, who ought to have an increased subvention. The present Act works very unequally; roads are sometimes on contiguous parishes; they happen to go through one, and they get the main road maintained by the county. The very next parish may have an equal mileage, but they do not happen to have a main road, consequently they get no help. Since turnpikes were abolished the use of the roads by the town traffic is very hard upon the country districts. I think it can only be met in that way by having all public roads that are maintainable out of the rates taken over by one authority. I was many years on the Highway Committee whilst it was under the magistrates, and we had a very much better system under the county surveyor than previously obtained. Now it has rather gone back under the County Council to the local authorities again—I think very much to our loss—because a trained road surveyor is a very difficult man to get. I believe I have made far more roads than anybody else in the county of York, and I know that it is a very difficult thing to get a really good road maker. In all these small places the management of the roads is a grievous mistake, and at the same time a great burden upon the farmers.

20,581. What is the union in which Lord Savile's estate is?—It extends from Wakefield to the borders of Lancashire, it is not in one union.

20,582. What are the unions then?—There are a great many of them, including Wakefield, Halifax, Huddersfield, and Todmorden.

20,583. What are the purely agricultural unions?—There is no such thing as a purely agricultural union there.

20,584. The estate, then, is divided between unions which practically contain large urban districts?—Yes; local boards prevail, but then very many of these local boards ought to have been rural authorities.

Rates.

20,585. Have the tenants had the benefit of the reduced assessments in proportion to the reductions of rent?—Nearly always the tenant has asked me for a certificate in order that he might have his rateable value lowered, but then as a rule the rates have increased. Take the education rate, and others, that have been from time to time imposed. I do not know that there is a reduction as regards each man if you go back.

20,586. You do not know whether there has been an actual reduction of payments?—No.

20,587. Have you any figures bearing upon the subject?—I am sorry to say I have not. It is not as if I had only to deal with one union. The estate is so spread over the county; there are 500 acres here, 1,000 there, and in some cases 2,000, and there are so very many different unions that it did not occur to me to bring the figures.

20,588. Of course it is important to ascertain how far the tenants in such cases had benefited from the reduction of their rents in the reduction of their assessments, whether the rates have risen proportionately or not?—It is an important point which I had not thought of until this morning.

Succession duties.

20,589. There is a paragraph in your brief with regard to the burdens of successions; will you explain what you mean?—It has been a very grievous burden on this estate. During my agency there have been three successions, by three brothers.

20,590. (*Mr. Everett.*) In how long a period of years?—Between 1856 and 1887; that is 30 years.

Mr. W. Lipscomb.

24 May 1894.

20,591. (*Chairman.*) I suppose there was a peculiarity in the case that they had to pay the highest rate in each case?—Yes.

20,592. They were not legally, I presume, in the position in which they could claim the lower rate?—No; I was only regarding it prospectively.

20,593. The burden was very exceptional in their case owing to the peculiar circumstances of the family?—Yes.

20,594. Therefore it could hardly be taken as an ordinary illustration. In this particular case there were three successions, I understand, and each successor had to pay the 10 per cent. owing to the peculiarity of the case?—Yes.

20,595. And that was a heavy burden upon the estate?—Of course.

Adulteration.

20,596. Do you desire to give any evidence on the subject of adulteration?—I think it might be useful just to state that the Acts which would be to a certain extent in favour of farmers are so very little made use of by the urban authorities. It is very seldom one hears of any action taken by urban authorities to ascertain how far adulteration is carried on. Within the last two months the County Council took action themselves in a district which was suburban, in a case of selling lard. I was chairman of the court at the time. There was a very interesting discussion as to how far the American introduction militated against the sale of English lard. The case was first of all brought against the retail dealer, and he produced a guarantee from the Liverpool wholesale house.

20,597. What was the article?—Lard.

20,598. Was it sold as butter?—No, it was sold as pure lard?—It is only an indication of how necessary it is to see that the Acts are made operative, I wish rather to impress that. I do not think this would have been found out except by the action of the County Council in a suburban district. If it had been within Leeds it would not have been brought by the County Council, Leeds having a County Council to itself. But being outside the borough the County Council Inspector went into a co-operative shop and asked for a sample in the usual way, as they do for butter when the Margarine Act is enforced. The case was defended by the retail dealer showing a guarantee, and that brought the issue as against the wholesale dealer in Liverpool.

20,599. Were proceedings taken against him?—The case went on. All the expert evidence which had been produced as against the retail dealer was allowed to stand as against the wholesale dealer, in order not to repeat the evidence. On the second day the wholesale dealer came, but after the opening by his counsel he pleaded guilty to the admixture, to an extent which was allowed to be an adulteration, of stearine, and we then imposed a fine with costs, which they accepted. This admixture was consequential upon introducing the Chicago lard in lieu of English, because it required this admixture to pass it off as a pure article, it being otherwise too solvent. In Chicago they use, in plain terms, the whole hog, whereas the English lard is only made from the abdominal fat. The English producers from Wiltshire and elsewhere stated what their mode of making the article was, and that it did not need this admixture; and when we came to the facts we found that the admixture was used simply to pass off as English that which was American. That shows, and I think very materially, the necessity of seeing that these Acts are carried out. The difficulty is with the urban authorities.

20,600. In that case there was a conviction, and the law was vindicated?—Yes.

20,601. And that was due to the fact that proceedings were taken up by the Inspectors of the County Council?—Yes.

20,602. Your complaint is, that where the urban authorities have control, as may be the case in the Leeds district, that those authorities are not so willing to put the law in force?—Scarcely ever, that I hear of.

The Commons Act, 1876.

20,603. I see you desire to say something with reference to the workings of the Commons Acts?—Yes; Lord Saville is a very large manorial owner in the West Riding. I will take Halifax, as perhaps the most high land town in England. There are tens of thousands of acres of commons round Halifax, within a distance certainly of 10 miles, and a portion of that comes within the six miles which, in the Act of 1876, requires an immensely costly procedure before you can enclose anything. Since the Act of 1876, I have entirely declined to be a party to it when asked by any

Mr. W. Lipscomb. 24 May 1894.

labourer to enclose land. We will say that an application is made for a couple of acres to break up, and I have entirely declined to be a party to it; and it has had an effect which was never anticipated. I can safely say that wherever common land has been required in the slightest degree, by any of the towns, there has been no difficulty at all in dealing with the lord of the manor. He has been, in fact, the initial mover in giving towns all the rights he could hand over, and Halifax itself is an instance of this. But it is unfortunate that now legislation does not allow him to authorise the enclosure of a small piece where there are thousands of acres adjoining, and where it would do considerable good. Where a man has extra time, I have been repeatedly asked by men who have some trade of some sort or another, employed in some sort of shop or factory, to be allowed to enclose and improve a piece, and I have not ventured to do so since the Act of 1876.

20,604. But I do not understand that the Act of 1876 could have made the difference, because the enclosure of those bits of the common by the lord of the manor would have been equally legal before then as after?—Then I am under a misapprehension if it is so.

20,605. Apparently attention has been specially directed to the subject, since the Act of 1876, and probably Lord Saville was unable to do since then what he freely did before that question was raised?—I am under correction if that is so. If I had not received such authority that the Act of 1876 introduced no different procedure I should not have thought it.

20,606. That is my impression; I think I know something about the subject?—I am sure you do.

26,607. There is no difference in law since 1876, although the process of enclosure is made more difficult. Apparently from what you said, Lord Saville was able, before 1876, to enclose without obtaining Parliamentary powers?—Under the Act of 1876, within six miles of a town you must give notice to the authority. Take Halifax. Under the Act of 1876, you must give notice; that is the initial proceeding.

20,608. That is only with the view of enabling the town authorities to object to the enclosure before the Enclosure Commissioners. It does not in any way affect the legality of the enclosure under the Act or before the Act?—I do not like to contest the point: if you say that is so, I must accept it; I can only say that nobody told us so.

20,609. It might be that Lord Saville had power to enclose under some custom of his manor?—I think so. I think that manors all have their customs.

20,610. But in that case the Act of 1876 would not affect that particular right. However, those are very intricate questions?—I thought it would be of interest to you to know. It is quite clear with a thousand acres say, many of them more, that it is quite a different thing to where there is only a limited number of acres which can possibly be of advantage to the community, kept in a wild state. But nothing could be more positively useful than a common to working men to enclose a piece and cultivate it on terms which would prevent them being disturbed, and that has been entirely checked. Perhaps I ought to have gone on.

20,611. I rather gather that in your opinion where the acreage of commons is very large that the lord of the manor should enclose small bits to working men?—Yes.

20,612. Without any Parliamentary proceedings?—Yes.

20,613. That is the purport of your recommendation?—It has stopped a very useful process it is quite clear where thousands of acres are concerned.

20,614. The only difference is that the Act of 1876 called the attention of the public to the proceedings, and the probability is that they were no more lawful before 1876 than since in strict law; but I gather from you that you desire that where the commons are of very great extent, the lord of the manor should have the power of enclosing, without Parliamentary sanction, small pieces specially for the working people?—I would not like to state that the lord of the manor should have the power of enclosing. I should like to say that he might have the power of authorising every genuine working man; I do not care how guarded it would be, for I should be very jealous of giving lords of the manor the right to enclose.

20,615. Then it might be put in this way, that greater facilities for Parliamentary sanction for the enclosure of small pieces should be afforded?—I am afraid that the obtaining of Parliamentary sanction for the enclosure of an acre would be that there should not be any such a bargain.

20,616. I am trying to see what your view is?—To facilitate the enclosure by working men where so large an acreage existed that there could be no possibility of either public or private interests being injured.

Mr. W. Lipscomb. 24 May 1894.

20,617. With I presume the consent of the Lord of the Manor?—Yes, because he would be able to give the title. Somebody must be able to give the title to prevent disturbance. While we are on the commons I should like to state a case, knowing your knowledge of the subject, if you will allow me. There is a common close to Howarth, near Keighley; we call it a common, I am a freeholder myself in it, we have tried to have it regulated. Three-fourths and upwards of the freeholders, I should think four-fifths of the holders, have tried to have it regulated, and we do not want to enclose it, and we have failed to do so. I think there is a want in the Enclosure Acts, or rather in the Commons Acts which would give the power of a preponderating majority over a single individual who objects.

20,618. My impression is that that is so already under the Act?—For some reason the subtleties of the Act have decided it, that it is not a common under the category dealt with by the Commons Act. We have applied to the Enclosure Commissioners, and they so reported some 10 years ago.

20,619. (*Viscount Cobham.*) They have no jurisdiction I suppose?—No, they have not the jurisdiction necessary to get over our difficulty.

20,620. (*Chairman.*) In the legal sense of the term I suppose?—Yes.

20,621. (*Viscount Cobham.*) What is the name of the common?—Stanbury.

20,622. (*Chairman.*) There might have been some special circumstances which took it out of the ordinary category. The consent of two thirds of the commoners is sufficient to obtain a regulation with the consent of the lord of the manor?—There is no lord of the manor here.

20,623. And the commoners are freeholders then?—Yes; but our power of utilising is entirely set aside by this inability.

20,624. It seems, I think, to be a very special case?—Probably.

Highways.

20,625. (*Viscount Cobham.*) What is your experience of the administration of the roads by the county councils?—In what respect?

20,626. As to cost and efficiency?—There is a decided improvement in the efficiency, and I think I have stated that where they were under the magistrates the Highways Committee have gradually put great powers into the hands of their surveyors, so as to obtain efficiency of management.

20,627. So that the County Council took them over in good condition?—We were gradually improving them—I would not say in good condition—I hardly know any part of England at any rate, over a large district like the West Riding, where they are in good condition.

20,628. Have the county highway rates gone up since 1888?—There has been the subvention to keep the rate down for the main roads.

20,629. So that they have not increased?—In each county I think they have a discretion as to declaring what may be main roads, and I think myself that in the West Riding, it has been rather too narrow. I think it might be very widely extended on account of what I am speaking of. What they have declared to be main roads which of course applies to all Turnpike Trusts, have all become main roads under the Act.

20,630. You say from your experience of the County Council that the administration of the whole of the roads would be economical and an advantage to the farmer?—Distinctly.

20,631. Do you think that the farmers hold that view?—I do. I never met a man who did not know that he could make a road.

20,632. They prefer to maintain the roads in their own parishes themselves?—Yes; it is miserable to see what the parochial management is.

20,633. Do you think that the farmers' pockets would in the long run be relieved by a more centralised administration in the hands of the County Council?—I will not be quite certain of that; in my opinion that is exactly where they have a right to expect relief altogether of this expense. You cannot have a very much improved road with a diminished cost. I am certain that the roads would be improved and I am certain there would be less waste.

Mr. W. Lipscomb.

24 May 1894.

But instead of very bad roads we should have an improved system of roads.

20,634. We should have better roads at possibly some increase of cost?—Yes. I should like to emphasize what I have put in my notes, that I think that the operation of traction engines is most hard and unjust upon rural districts.

Traction engines.

20,635. Do you mean agricultural traction engines?—No, for traders who are never off the road. I draw the line between a load which cannot be divided like a boiler or like threshing machines, and a brewer and a flour dealer.

20,636. Do you suffer much from those traction engines?—Terribly.

Agricultural education: dairying.

20,637. Do you consider that agricultural education is being benefitted by the technical education grant in the counties with which you are acquainted?—The dairying has most distinctly improved.

20,638. How is that carried on?—By travelling dairies. It is a most gratifying improvement.

20,639. Are these travelling dairies well attended and well appreciated?—Yes, the farmers' wives have seen and believed. Lectures would not reach them; but I am happy to say that in a way that is very well tested. Where these small dairy farms adjoining the moors I hardly knew a single case where there was a thermometer used 10 years ago, now there are very few without them, which is a fair test.

20,640. You think that already the effect on butter has been to improve it?—Distinctly.

20,641. And these travelling dairies are highly valued?—Most certainly, there is no question about that.

General education.

20,642. As to the more general agricultural lectures, have they succeeded?—I am sorry to say in many cases they have not. There is an extraordinary difference in localities, but I earnestly hope that they may be kept up. I do not see any other chance than to try to educate in a higher degree from the elementary school to the large farmer.

20,643. Has great difficulty been experienced in obtaining qualified lecturers?—We have been very fortunate in the West Riding. I believe that in some districts they have been hard pressed, but in connexion with the Yorkshire College we have been very fortunate in getting excellent men.

20,644. Do the Yorkshire College find the lecturers?—Yes, we have a county committee of the three Ridings in connexion with the Yorkshire College which is the head-quarters of the staff.

20,645. They have hitherto found you the agricultural lecturers, have they?—Yes.

20,646. Do you find it quite easy to get a constant supply?—Yes.

20,647. Are you in favour of farm schools or central agricultural college maintained by a combination of counties?—We have the college you see, the Yorkshire College; I am in favour of having an experimental farm.

20,648. Is there a school of agriculture in the college?—Yes, there are regular classes.

20,649. But that is all purely theoretical teaching?—No, they take the pupils out to farms in the neighbourhood occasionally.

20,650. How is that maintained?—By grant from the County Council and the Minister of Agriculture.

20,651. It existed before the County Council?—Yes.

20,652. And it paid its way; it is not depending upon the County Council?—No, that is only with regard to two or three subjects. The students have increased year by year; I am not prepared to give the details of the whole establishment, but as regards the lectures that is where we look to.

20,653. Do you think that much can be done for the instruction of the labouring classes in the elementary schools?—I do. I think that now we have got a great number of elementary teachers who come for the specific teaching of agriculture, and so by degrees I am very hopeful to have quite a different curriculum for the rural schools; that is to say to have the objects of daily life more brought before them.

20,654. Are the county councils training elementary teachers?—Yes, they have given grants for that purpose.

Expenditure on maintenance of estates.

20,655. Turning to your figures, the cost of the maintenance must be very great on the Savile Estates, having regard to the large number of small holdings, is not that so?—It is 25 per cent.

20,656. For maintenance alone—or including buildings?—Not for buildings, I am taking general drainage and a variety of items.

Mr. W. Lipscomb.

24 May 1894.

20,657. (*Chairman.*) The difference between the gross and net rent is 25 per cent?—Yes.

20,658. After taking into account drainage and other expenses?—Yes.

20,659. (*Viscount Cobham.*) Excluding new works?—Excluding new works which are done by the trustees. I am not taking in the Trust Fund.

20,660. (*Chairman.*) You are not taking in expenditure on new buildings?—No, this is the regular expenditure out of income, the very large expenditure. There has been a very large expenditure from the Trust Fund; I may say, since I became agent we have had two private Acts of Parliament to enable the trustees to do that which now Lord Cairn's Act does.

20,661. (*Viscount Cobham.*) Do you include in that 25 per cent. the interest of money paid under those capital outlays?—Under the Settled Estate Act you can use the Trust Fund without paying the interest.

20,662. The whole of the expenditure has been under the Settled Land Act, you had no borrowing from Land Improvement Companies?—We had; but if you remember, an Act was passed, which Mr. Haldane brought in, making it retrospective and the tenant-for-life could get rid of that by the Trust Fund being utilised for that purpose for rent changes.

20,663–4. Has the fund been able to extinguish the Land Improvement Loans?—The trustees were enabled to deal retrospectively, but unluckily, extremely unluckily for Lord Savile, a private Act was got at my instigation, enabling the trustees to advance the money, without going to the Lands Improvement offices, and the Act was said by the opinion of counsel not to apply to his particular case, because it was not a rent charge through the Lands Improvement Companies which for a great number of years had been dispensed with under the private Act which we had obtained to enable the Trustees to advance it, and got recouped year by year; and Lord Savile pays upwards of 1,500*l.* a year for those improvements which had been made before the Settled Land Act came in. Now all that we do is done by the trustees without charging the tenant-for-life.

20,665. Is that 1,500*l.* a year a part of the 25 per cent.?—No; I calculate if I include that it would be above 25 per cent., it would be 27 per cent. But I am taking the regular outgoings independently of the annual outlay by the trustees.

20,666. It does not then appear that your charge for maintenance is so much in excess of that on an ordinary estate, notwithstanding the large number of small holdings you have?—I think that it is not many estates which have used the trust funds as we do; there are constant improvements.

20,667. The estate is in first-rate order after all this expenditure, is it?—Yes.

Small holdings.

20,668. (*Sir Nigel Kingscote.*) With regard to these small holdings, of which you have a great number, are there houses on all of them, or nearly all of them?—On all; I may say at the present moment that, as an average, the reduced rental does not exceed more than a fair interest on the buildings.

20,669. Do these tenants live entirely upon those holdings, or do many of them hire themselves out as labourers?—No, there is no hiring by themselves; that is where they are so badly hit. The increase of wages no longer enables men to hire at all except just for the harvest, and I include the hay harvest in the harvest.

20,670. But, then, am I to understand that they live and bring up their families on the proceeds of these small holdings?—Yes, where it is 30 acres.

20,671. In your opinion what is the smallest acreage that a man and his family can live upon?—I should put it at 30 acres of fair land.

20,672. (*Chairman.*) Is that with common rights, too?—No, there are very few cases, I may say, of that kind. They can have very little advantage.

20,673. Thirty acres without any common rights, you say, a man can live upon that acreage?—Yes, on fair land. I mean it to be understood that the children in a county like the West Riding very early go out to employment. Take the girls, they go out at a very early age.

Mr. W. Lipscomb.
24 May 1894.

20,674. (*Sir Nigel Kingscote.*) But they must be at school for a certain time?—Yes, and then they are half-timers.

20,675. Do the women and the girls work on the land, or do the girls go away to service?—Going into service diminishes every year on account of the greater attraction to young women of going into different trades, but in the rural districts the employment of women has almost died out in arable farms. But, of course, in the dairy farms the wife is of quite as much importance as the man, and in letting these holdings to a fresh tenant I invariably ask to see the lady.

Dairying.

20,676. You were saying that they had taken advantage of those dairy schools and that they make better butter. Do they get a better price for it now to encourage them to go on?—Yes. When you say a better price you mean in comparison with late years. But then they get a better price than they would in competition with foreign butter; in fact if they had not availed themselves of it they would be in a worse position.

Adulteration.

20,677. You gave us an instance as regards adulteration of lard. Would you like to see that action of the county council applied to other things, such as butter and margarine?—It is so; I should think I have been on the bench in at least 30 cases of adulteration with regard to the Margarine Act.

20,678. Such action has been very beneficial to agricultural produce?—Unquestionably, and the recent Act is a most admirable one for protecting the farmer with regard to feeding stuffs and manures.

20,679. Would you like to see that applied to meat?—I should.

The marking of foreign meat.

20,680. That anybody who sold foreign meat should declare it?—Most distinctly. We have a right to prevent the fraud where it militates against their interest.

20,681. Would you have him take out a license to sell foreign meat?—That seems to me the most likely way to arrive at what we want.

20,682. And that he must label it?—That is a greater difficulty.

20,683. These small holdings rear a great many cattle, do they not?—They do.

Cattle diseases.

20,684. Has not that district a few years since suffered from cattle disease?—The West Riding has not a very good repute whenever there has been disease, but of course now it is almost entirely stamped out, but the depreciated price of young stock is that which has brought them almost to a desperate condition—it is the principal factor in bringing them to the desperate position they have arrived at.

20,685. I ask that to get your opinion as to the working of the Contagious Diseases (Animals) Act, as to whether that has been of benefit to the country generally, or your district in particular?—I cannot use terms too superlative than to say if the action had not been taken which has been taken, I do not know where we should have been. It is really the bright spot upon our prospects.

Slaughter of foreign cattle.

20,686. Do you hold the opinion that it is advisable still to slaughter at the ports?—I am very strongly of that opinion.

Difficulty in letting.

20,687. (*Mr. Chaplin.*) In the case of those two holdings of 40*l.* a year, and 80*l.* a year, that you say you are unable to let now, is that owing to agricultural depression?—Entirely; those farms used to be prized to that extent that I should have had six or eight applications if there was a hint of a vacancy, and I have advertised those very widely and the one at 80*l.* a year has a large sheep walk attached to it and I cannot get any offer.

20,688. Do I understand you rightly that it has led to a great diminution in the employment of labour in that district?—Yes.

The Agricultural Holdings Act.

20,689. You have given us some very interesting information with regard to the amendments in the Agricultural Holdings Act which are proposed by the committee appointed by the Central Chamber of Agriculture; what I want to ask you is this, supposing that they were embodied in an Act of Parliament, how would they affect the question of agricultural depression in your opinion? Would they be any remedy for agricultural depression?—On badly managed properties it would do good, but as a general remedy I do not think that it would have a scintilla of influence.

20,690. I must take it I suppose from you that you advocate those amendments as things that are proper and ought to be carried out, but not as remedies for agricultural depression?—No, just as the result of experience of the working of the Act.

Mr. W. Lipscomb.
24 May 1894.

20,691. Then you hardly touch the question of depression?—Only in the way that I speak of. And then the capital of tenants, the little left, is more sensitive, you know.

Foreign competition and fall in prices.

20,692. What is your view as to the main cause of the agricultural depression?—I have not the smallest possible doubt that it is entirely due to foreign competition.

20,693. Foreign competition affecting agriculture here by a fall of prices?—By the fall in prices caused by foreign competition.

20,694. You hold that the cause of agricultural depression is a fall in prices and that fall is caused by foreign competition?—Yes.

20,695. Should you say that there can be no remedy for agricultural depression unless there be some rise in price?—I do. Everything depends upon the question whether the present depression in prices can be alleviated.

20,696. Has it been, as far as you can judge, of a progressive character?—Yes, little by little.

20,697. Have you any reason to suppose that we have what is called touched bottom, or do you think that even a lower range of prices is probable in the future?—I hardly know that I can be right in saying that we are not likely to expect it, because I should have said that a few years ago, and we have seen a lower range of prices arise to-day; but that has been concurrent with some wretched seasons, and I would fain hope that we have arrived at the bottom. I think we have.

Succession duties.

20,698. I want to ask you one or two questions with regard to what you said as to the burden of the succession duties, as it has happened in your experience. What has been the effect of the heavy burden of the succession duties rapidly repeated, on the estates of which you have the charge—what has been the general effect?—The first effect is to dispense with every available labourer who can be dispensed with. That is the first effect.

20,699. Is that in order to reduce expense?—Yes.

20,700. The necessity for that being entailed by the heavy burden of the succession duty?—Yes, as a paramount requirement; and the next is to postpone improvements asked for by tenants.

20,701. (*Chairman.*) I understood you to say that there had been an increase of expenditure on the part of the landlord of late years?—Yes.

20,702. Therefore what you speak of now is merely an inducement and that has been followed by that result?—Yes, for the time; I am speaking on the succession.

20,703. How long did that last in each case; about a year or two years?—Two years I should say; that is the acute stage.

20,704. (*Mr. Chaplin.*) But in addition to what you call the acute stage, I understand that the general effect has been to curtail the expenditure on these very important matters?—Most certainly; so long as the charge lasted, over which the payment of the succession duty spread, and which varied in each case.

20,705. Will you tell us if there have been any other unfortunate effects. What has been the case, for instance, with regard to the subscriptions which are so common on estates?—I need not say that in the West Riding, from the property being so spread that voluntary subscriptions (which are almost incumbent) are very numerous, and I need not say, that necessity having no law, we have been obliged to refuse in many cases, subscriptions which are for the benefit of the poor, in the way of reducing subscriptions to all good works, such as infirmaries, schools, churches, and other voluntary measures intended for the general good. Of course, having the power over those, one is bound to limit the subscriptions.

20,706. (*Chairman.*) Would they be reduced for a limited period only, or permanently?—I am speaking with respect to the acute period which I was taking, where they suffered particularly; and so long as the succession duty remained payable that obtained over the whole of the area, more or less.

20,707. Then the subscriptions were resumed after the end of that acute period?—So long as the succession duty was payable they had to be of a less generous character; I think it almost goes without saying that you are obliged to curtail the expenditure. But what I wanted particularly to bring out when I said the acute stage was that, of course, a man in succeeding to landed estate (at any rate my experience has been that there is no personalty) and that

therefore before he is in receipt of rents, he is obliged to be indebted to his bankers for the payment of the first weeks' labour bill—he has nothing to pay it with. And then comes the knowledge that the succession duty must be met, so that for a time, at least two years, it puts you in a condition that you are obliged to hold your hand in what is most useful work.

20,708. (*Mr. Chaplin.*) What you mean to say is this, that in the case of real property there are certain amounts of absolutely necessary outgoings which must be met, and you have nothing to meet them with?—That is so.

20,709. And consequently the burden of the succession duty has been a very heavy burden in this case?—It is so. If I might give the actual instance on Mr. Henry Savile's succeeding to the estate; I heard the advice given to him, "Shut up Rufford: go abroad; and then you will be able to do it;" that meant, if he did, there would be the discharge of a very large number of people around that mansion.

20,710. That occurred at the time when the succession duty was payable, not on the capital value, but on the income, or the annual value?—It has never been otherwise, that I am aware of.

20,711. Quite so. Assuming for the sake of argument that the succession duty should be charged upon the capital value, instead of the evils that you have described as occurring already, I suppose that would be *pro tanto* increased?—Well, I cannot help saying that I have contemplated it with almost despair, if you come to the capital for the tenant for life of a settled estate.

20,712. All these evils which we pointed out have fallen chiefly upon the labourers, and the poor in a district would be enormously increased?—It would.

20,713. Then as regards the future prosperity of agricultural estates, you would regard any proposal of this kind with the greatest apprehension?—Anything which tended to diminish the present capabilities of an owner to keep up the estate, as I say, makes an agent almost in despair to contemplate.

Rental of estates.

20,714. What is the rental of your estate which you manage in Yorkshire?—The gross rental exceeds 30,000*l.*

20,715. And do you know what the rental of the several properties in Nottinghamshire is also?—No, I am not prepared to say that.

20,716. (*Chairman.*) It is very considerable, is it not?—No, it is not, I am sorry to say, as compared with the West Riding: nothing approaching it.

Capital value of estates.

20,717. (*Mr. Chaplin.*) The capital value of the two estates would be something very large?—Yes.

20,718. Would it approach a million?—Yes. I assume when you say the capitalised value you mean the saleable value, because there is so much to which I have been directing my efforts, prospective in its nature.

20,719. (*Mr. Whitehead.*) I think the Committee of the Central Chamber proposes to allow tenants to plant orchards to the extent of one acre?—Yes.

The Agricultural Holdings Act. The schedules: Part II.

20,720. Will you tell me why they do not give them more power to plant more acres; why they limit it to one acre. Why should not they have power to plant orchards altogether without any limit?—There was an unanimous opinion that we ought not to take the consent of the landlord out of that schedule, excepting in small quantities, where there was a desire to increase to a very moderate extent. We have left the schedule as it was, with the exception of this small piece which we consider that the tenant ought to be entitled to do by giving notice, and without obtaining consent.

20,721. Some witnesses before us have wished to leave Number XI. altogether out of Part I. of the first schedule; that is, planting of orchards, fruit bushes, and to put it into Part III. You would not agree to that?—No, I do not know any tribunal, if I may say so, in which varying opinions could be better expressed than we have at the Central Chamber; and I have heard very little difference of opinion as to this.

20,722. And you would apply the same to hops, Number 10; and allow a tenant to have one acre if he thought it desirable?—No, we do not give the opportunity of planting hops without consent.

20,723. Did you consider that question?—There was no suggestion which came up to that effect.

Small holdings.

20,724. With regard to the small holdings that you have told us of; I think you have not described what the tenants cultivate chiefly?—The great proportion of the small holdings have very little arable attached to them, they are mainly grass, you may say dairy and grazing.

Mr. W. Lipscomb. 24 May 1894.

20,725. Is there fruit culture or are vegetables grown?—Very little indeed. It is only just recently I have let a small farm to a market gardener for this special purpose of fruit raising in Yorkshire; and I do not know a better lesson than the last week with such frosts as we have had. In the districts I used to live in, in Cheshire, damsons were a common growth in every garden, and the same in parts of Nottinghamshire. At Tuxford it was a common growth. But directly you have a good crop they are unsaleable; so that to make it a panacea for the depression in agriculture it is a most far-fetched notion which could never be carried out. What can be done is done within the reach of large towns, namely the growing of vegetables, particularly such as celery, and the hardy fruits, gooseberries and currants for preserving.

20,726. But I understand that near these small holdings there are large towns which might be supplied with these kinds of vegetables and the hardier kinds of fruit?—I do not think that is so to any large extent—not to touch the large estates. I am only too happy to bring in capital in any way, and this particular instance only took place last year. I should like to see market gardens established. This case that I am referring to the tenant took a lease of 21 years, and it is the only single lease for a farm that we have been asked for; nobody will have leases.

20,727. Would a holding of 30 acres devoted to dairying keep a man and his family?—I guarded my answer by saying that the sons and daughters go out directly they are old enough.

20,728. But they are at home up to 12 or 13 years?—That is so.

20,729. As a matter of fact do men maintain their families on 30 acres?—Yes, if it is good land they do; and it really depends more upon the wife than the man for dairy management.

Traction engines.

20,730. There is only one other question. With regard to traction engines used by traders, are you aware that in some counties a tax is put upon traction engines now generally?—A license is required to be taken out for the traction engine, and in the West Riding it used to be 5*l.*; and while it was under the magistrates at my own instance I put it up to 10*l.* which is the maximum; I think 10*l.* is a most ridiculous contribution to a general fund when they are going over the roads every day with their traction engines.

20,731. Have not county councils the power of charging what they like in the way of taxes on traction engines?—I am not aware of that. It used to be limited to 10*l.* I am not on the county council. I was on the Highway Committee of Magistrates, but I am certain that 10*l.* was the limit then.

20,732. I was under the impression that there was no limit?—But the use they make of the roads is beyond all reason.

20,733. (*Mr. Little.*) The amount has not been altered?—I am not aware that it has been altered.

Succession duties.

20,734. (*Mr. Giffen.*) With regard to the succession duty on the Savile estates, could you tell us what was the proportion of the value of the life interest to the succession duty—to the total value of the estate?—10 per cent.

20,735. That was the duty?—That was the duty.

20,736. But what was the proportion of the value of the life interest to the total value of the estate?—It is upon the life tables. It is according to the age.

20,737. Yes, but I should like to know in this particular case what the proportion was?—I can tell you what each succession duty amounted to in the individual case, but I had not the direct payment of it.

20,738. (*Chairman.*) The two last successors inherited at somewhat advanced ages, did they not?—Yes, it depends upon the age.

20,739. Especially the present Lord Savile; he came in at an advanced age, and he would pay only upon the life interest, and something very much less than 10 per cent. upon the value of the properties?—These are public tables.

20,740. (*Mr. Giffen.*) But still it would be very interesting. You represent that the duty paid was a very heavy burden, and one would like to know how much it is in proportion to the capital value and the rental value of the estate?—These are upon tables which, of course, are open in the same way as in buying a life annuity. I have not got them before me; therefore I cannot answer the question.

Mr. W. Lipscomb. 24 May 1894.

20,741. But we do not know the ages at which the people succeeded in this particular succession. I want to know if the burden was very heavy in proportion to the capital value, and the rental value of the estates?—I cannot give you the answer in the shape you want it. All that I know is the practical effect.

20,742. But you cannot tell us what the thing was that produced that effect?—I know what each paid.

20,743. How much?—The first successor paid 48,000*l.*; the second 56,000*l.*, and the present one 30,000*l.*

20,744. What was the rental at each time?—That I cannot tell you.

20,745. What is the rental now?—The gross rental is 30,000*l.*

20,746. (*Chairman.*) But that is upon one estate only. You stated the amount paid on both estates?—Yes.

20,747. Including the trust money and everything?—If you take the total rental I am quite certain that any rental would not exceed what I have been giving.

20748. (*Mr. Giffen.*) How much?—30,000*l.* is what I stated.

20,749. And the duty paid in the last case was also about 30,000*l.*?—Yes.

20,750. So that that was about one year's net rental?—No, I am not the agent for the Nottinghamshire estate, and that is where the mansion is, and of course you are aware that a very large per-centage on an estate of that sort is swallowed up by the establishment. On the Yorkshire estate there is none, so that outgoing I cannot give you, not being the agent there.

20,751. But the outgoing upon the establishment is not an outgoing that belongs to the rental of the estate properly speaking?—I am afraid the owner of a mansion would think so.

20,752. As a matter of fact it is not an outgoing connected with the business of the estate; it is a man's expenditure out of his net income surely?—I cannot regard it as such. If that is shut up, that is exactly what was advised; if he shut up Rufford it would dispense with a very large amount of labour at once and would be no discomfort to the owner. He was advised to go abroad.

20,753. You cannot take that expenditure as a reduction of the net rental of the estate?—I am only giving it as a reason that I cannot give the returns of the Nottinghamshire estates, but I do know that the white elephant of a mansion with its surroundings absorbs a very large percentage of it.

20,754. But still as a matter of fact the duty did not amount to more than one year's rental in the last case you spoke of?—I will not say net rental.

20,755. (*Chairman.*) You do not quite know what the net rental is?—I do not.

20,756. The gross rental of the Yorkshire estate is 30,000*l.*; besides that there is the Nottinghamshire property; and there is also considerable trust money. Are there coal mines there?—None.

20,757. Are there any in Yorkshire?—Yes. My returns embrace all the coal mines.

20,758. In the list of great owners of land in England and Ireland, I see the estate is put down at 17,000 acres with a rental of 17,000*l.*; and the West Riding estate is put down at 9,000 acres, with a rental value of 23,000*l.*, making a total of 26,000 acres and a rental value of 40,000*l.* You say that the gross rental of the Yorkshire estate is 30,000*l.* instead of 23,000*l.* which is given here. Then on the Nottinghamshire estate at that time it was a rental of 17,000*l.* a year on 17,000 acres which does not seem to me to be highly rented?—There is a large amount of what is called forest land; there are 2,000 or 3,000 acres which is absolutely without any renting.

20,759. Then he has got double the amount in Nottinghamshire to what he has in Yorkshire?—That is a mistake.

20,760. But still one has always heard in connexion with Nottinghamshire that it is one of the large properties in the county?—The area of the Nottinghamshire estate seems correct.

20,761. He has got more in Yorkshire?—Yes.

20,762. (*Mr. Giffen.*) You do not think that the agents have been exaggerating the effect of the duty in inducing them to curtail expenditure?—Inducing whom?

20,763. The owner of the estate to curtail the expenditure?—The succession duty is entirely paid by the solicitor to the estate. The agents have nothing to do with the payment to the Government; but I cannot imagine that the owner would not know to a fraction what he has to pay.

Mr. W. Lipscomb. 24 May 1894.

20,764. Why should a payment which is less than one year's net rental have such a disastrous effect upon him; could not he wait for a year and go on with the expenditure; it is only a temporary thing?—You are now speaking of the present Lord Savile.

20,765. I am speaking of the case you put before us; it is only a name to me?—When you say to the present owner, it can only apply to the last successor; he came in in 1867, consequently it is a very much reduced payment. It does not apply to his brothers, one of whom paid 56,000*l.* certainly. They do not get anything approximating if you take the average of the three, what you would call one year's rental.

20,766. But to the previous gentleman the net rental was more than it is now I assume?—It was, but the expenditure was also greater. The causes are these: when I first took this management there was not a single acre of land of any description let on lease; many of the estates were without roads; there was no drainage to speak of; and all these have been done, and I am afraid it might be said that the expenditure was rather hard upon the tenant for life, but with every tenant justly calling for improvement you had to face it.

20,767. The statement that the duty interferes with capital expenditure upon improvements is one thing, and the statement that the duty prevents ordinary expenditure for repairs, and things of that kind is another thing surely?—They are very different things; the one militates against the other, that is all that I say. You cannot for a time undertake such and such works because this particular payment is first and foremost; it holds your hand.

20,768. Do you think that the effect of the duty would be to prevent the expenditure of capital generally all over the country?—Most distinctly upon landed properties. I never heard it questioned. I have heard many agents bemoaning themselves that the succession duty has prevented them doing this and that, but I never supposed that it should be questioned.

20,769. Why do not they sell part of the property and invest it in something else?—That I have done so far as I could to enable the trustees to have funds for their capital improvements. If I apply to-morrow for 5,000*l.* to make roads and bridges the solicitor very soon informs me if such a fund is in hand or whether I must sell something to meet that.

20,770. So that the duty would only have the effect of causing a certain amount of sales. It would not prevent the improvement generally?—But hitherto you could not use the Trust Fund: it must be out of income up to that period. I am aware that there is a suggestion in Parliament now for sale; but hitherto that has been the case.

20,771. Surely it ought to be paid out of capital?—Yes, distinctly.

20,772. (*Mr. Clay.*) Landlords having an income, should not they save a part of that to meet emergencies of that kind?—That is a question of morals which I can hardly be expected to answer; all I know is that the best way is to shut up your house and go away.

20,773. There is no occasion to shut up a house; you can live and keep the house open?—I beg your pardon; in such a case as Rufford, and you must be acquainted with other large ones, it is impossible to do so. Take gardeners, who are the first people whom a man always thinks of. Supposing you sell your produce, that is what I have heard over and over again advised under such circumstances, and they say that this will reduce your expenses. Well, it is a miserable return; and I have never heard that a man has got anything from a large staff of gardeners. If he discharges the gardeners, and leaves his house, you know what becomes of the whole of the gardens, including conservatories, and so forth; they go to wreck.

20,774. (*Chairman.*) There is nothing to shut up in Yorkshire?—No.

20,775. The whole estate is a non-residential estate, and the landlord does not live there?—Yes, but I understood the Commissioner's question was whether a landowner could not reduce his expenditure. The first thing is to shut up the establishment to do that.

20,776. But you have nothing to shut up in Yorkshire; with a large estate of 30,000*l.* a year, there is no resident landlord there?—There is no estate, except a shooting-box.

Mr. W. Lipscomb.

24 May 1894.

20,777. (*Mr. Clay.*) But is there any difference between the commercial man and the landlord having an income?—It is a totally different thing. There is not such necessity; there is not such outgoing that I have heard of connected with a mercantile man, unless he took one of those places, and one-third of the whole of those places are now occupied by mercantile men on account of the pressure on landlords.

20,778. What right has a landlord to live up to or above his income; why should not he save money?—It applies to everybody, I think. I think it must be allowed by all who know what our large landlords' establishments are in the country, that they are a source of immense employment to the labourer, and that the shutting of them up is a terrible blow to any neighbourhood. There is not an exception in England. If you shut up an establishment, which is the first thing a landlord is advised to do, you could not have a worse thing for the country. I know a case; I do not choose to go into names; where it is a terrible misfortune to a whole district to have had a large establishment shut up.

20,779. Is it a worse case than where a tenant lives up to his income, and when he dies he has to discharge the whole of his labourers?—It is the same thing; the landlord discharges all the labourers by the shutting up of the establishment, and it is a dreadful blow to the agricultural labourer in that district, at whatever period it occurs. But if I am asked the difference between the landlord's establishment and mercantile men's establishments, I think I have a fair knowledge of it in the West Riding, the latter has no sort of community of influence upon his neighbours.

20,780. A farmer is much in the same position if he lives above his income; he cannot employ his labourers?—Unfortunately, I know, if he lives above his income he has no living left.

20,781. If the landlord lives below his income and saves money, he could meet an emergency. What is the difference between the tenant and the landlord with respect to that?—I really can see no parallel.

The Agricultural Holdings Act.

Compensation for home-grown corn.

20,782. You are of opinion that under the Agricultural Holdings Act there would be no difficulty of a tenant using his own corn, and getting compensation if he used it upon his farm?—I think there is great difficulty. I stated it would be very difficult to produce the evidence which would be required to establish his claim in the opinion of an umpire; but I think it is a just claim, assuming him to give the proof.

20,783. What would you recommend as proof?—I think it would be better to give the notice. It could only occur in the last year of his tenancy, and he should give the agent notice that he was going to use a certain per-centage of his corn through a certain field of 10 acres say, and that he was going to use that entirely upon the holding; and if he gives the notice that he is going to do so, that it should not be then questioned that he has established his claim.

20,784. That is, if he has to get compensation, he should be at the trouble to give the land agent or the landlord a monthly notice of what he is going to use?—Not a monthly notice, but a notice beforehand of his intention to consume instead of selling. That would be the readiest way of establishing it before the umpire. It all rests with the umpire whether he has had a sufficient voucher that the tenant has used that corn which he himself has produced. There is a great difficulty, and I am only suggesting that way of making his claim to put it beyond suspicion.

20,785. But to bring the question to a narrower focus; if the tenant gives his landlord or his agent notice that he had used, or was going to use, say, 50 quarters of wheat monthly, then the land agent would have some reasonable way of checking that delivery?—He would go over and say, "What part do you intend to use?" if he had thrashed it, or stacked it, he would say, "What part do you propose to use?" and if he wished to go over it at some period between the notice and the expiration of the tenancy he would have the power to do so. I am extremely desirous of giving the tenant the means of establishing his claim without trouble.

20,786. But you conceive that that difficulty can be overcome by some process of that kind?—I would suggest that as one system of doing so.

Position of the tenants.

20,787. You spoke of some of your tenants rather getting into difficulties, but you said you have been able to keep them on their legs?—Yes.

20,788. Are you still keeping them on their legs?—Except the two that I mentioned.

20,789. Are they keeping the farms in the same condition?—I am sorry to say that they are all impoverished.

Mr. W. Lipscomb.

24 May 1894.

Small holdings.

20,790. Regarding small holdings, are they making a livelihood, so as to keep their families?—Yes, I have answered that three or four times, that their children being in an industrial neighbourhood, where all kinds of employment are within their reach, go from home at the earliest possible time, and to a certain extent that is against the occupier, because he loses a strong lad's employment, which in former days he would have obtained. Now that lad, as soon as he can hold his own, leaves the small farm, he is no longer satisfied with what he used to be, and goes into some other employment, and the father loses his services.

20,791. The 30 acres of grass land is sufficient to keep a family and make a livelihood?—It is done for young children. I am not speaking theoretically, in fair good land they do so.

20,792. (*Mr. Gilmour.*) Following up that question of the small holder. When the strong lad leaves, as you say, the man will have to employ some one in the lad's place, will he not?—No; I am sorry to say that that is where the great falling off is; that farms as a rule are going down for want of labour; they cannot afford to hire excepting during the harvest, and it goes without the hired servant.

20,793. Then it results in the man and wife being able to carry on 30 acres in such a way as to make a living of a sort?—Yes, but I am sory to say that it is not much.

Traction engines.

20,794. You have mentioned tradespeople that have come out into the country. Do I understand that those people use traction engines?—There are two classes of traders who come into the country, brewers and millers.

20,795. Do they bring their grain and beer in with traction engines?—Yes, with traction engines. The county bridge at Wakefield requires repaving with granite in one third of the time less than it did since traction engines came over it; that I know from being on the Highway Committee. Then they come on to the country roads; and one dreadful effect upon the convenience of farmers is that small country millers have been extinguished, and the farmer has no longer a small country miller to which to send his grain for his own use for grinding or any other purpose. They are extinguished by the large capitalists who take these traction engines to the said user of the roads and to the absolute loss of the agricultural tenants.

20,796. It has come to be a fact that these traction and steam locomotive engines have come to be considered as ordinary traffic on the roads of the country?—Yes.

20,797. Are you in the habit, under your Highways and Bridges Act, to charge for them as extraordinary traffic?—Certainly under the ordinary Act: but then it has been established that this is not extraordinary traffic.

20,798. Is that not rather a hardship upon landowners, who for instance cut down woods and get their timber carried off by steam locomotion. You come upon them, I take it, for extraordinary traffic on that part of the roads, whereas these others who are continually on the road day after day are using traction engines and not coming under that extraordinary traffic clause. Is not that a hardship upon the landlord?—If it was so; but I am not aware of the landlords using traction engines except in the ordinary way of a threshing machine used from farm to farm; and I draw a distinction as between that and the constant use of traction engines which are never off the roads, for trade purposes.

20,799. But it is a very useful thing in some parts of the country to carry our timber off an estate with traction engines; at any rate in our part of the country it is considered extraordinary traffic and charged for accordingly?—I should think that that is an extraordinary hardship if the landlord is charged and the trader is not. I had hoped that the traction engine could have been charged as for extraordinary traffic; but I found when I was on the Highway Committee that they could not; and hence I think that the license should be very much larger than 10*l.*, which is a mere fraction for their use in rural districts. Then many of the country roads are not above 20 feet wide, and no carriage or cart can pass them; and these traction engines use the road which merely means the ousting of the ratepayers of that particular district on the narrow roads. They should be limited in my opinion to roads that are 30 feet wide.

The Agricultural Holdings Act.

Valuers and umpires.

20,800. You do not propose to start with one valuer to decide the whole question between the landlord and the tenant; you propose to have a valuer on each side, and then an umpire?—Excuse me, the Agricultural Holdings Act always has in view the power of having one man to

Mr. W. Lipscomb.

24 May 1894.

start with; we have not altered that; it is only where each man appoints his valuer.

20,801. But in the end as a rule, and in your experience does not it come to one man's deciding all those questions namely, the umpire?—No, about one half I should think; I merely give that as a guess; one half are referred to an umpire, and the other 50 per cent. are decided by the two valuers.

20,802. Do you see any practical objection in starting with one man?—I invariably recommend it if they come to me for advice, and I take care that that man should be a man of the best stamp.

20,803. If that is your recommendation, would you not think that it would be a good thing to carry out as the mode of doing it?—Not as a compulsory measure; that is often talked of. I think farmers would never agree to that. They would consider it an extraordinary hardship not to have the option of choosing their own valuer.

20,804. Do those valuers not become advocates rather than fair valuers?—That is why I want the umpire to be named before they commence—in the initial stage. But you know the feeling of the farmers; they do not like to be entirely ousted from choosing a man of their own. We have put in a recommendation that if he chooses he may act as valuer for himself in the initial stage.

20,805. (*Mr. Channing.*) And the landlord also may act for himself?—Either side may act.

Claims and counter-claims.

20,806. (*Mr. Gilmour.*) You think that the counterclaim should be put in simultaneously?—Yes.

20,807. That each party must, on the same day, receive notice?—Yes.

20,808. Is that a matter that can be practically carried out?—Very easily. It is in order to meet a very practical objection which has been raised repeatedly, that the counterclaim is, what is called, made "a bounce" on the claim sent in by the tenant; and if it, the counterclaim, were sent in the same day it would be impossible to lay that allegation inasmuch as the owner would not know what the claim was.

20,809. Is not it quite possible for the tenant to be at a disadvantage under the Time Clause, when he deposits his claim in an agent's hands by an early post, and the agent makes his counterclaim after having the benefit of seeing that, and then delivers the counter-claim by messenger in the evening?—That was well considered in committee; and we have put it that the registered letter should be considered the date of serving, so that you deliver your claim, say on the 28th, the day before, and you receive from the Post Office the receipt for your registered letter. That will not arrive until the next morning. We thought that very well out. This counterclaim has given rise to so very much dissatisfaction that we have paid immense attention to that point.

20,810. (*Mr. Little.*) You were chairman of the Committee of the Central Chamber that drew up the model scale of compensation under the Act of 1883?—Yes.

Scale of compensation.

20,811. And you incorporated that scale of compensation in agreements with which you had to do?—Yes.

20,812. Thus proving that you were thoroughly satisfied with it?—Yes.

20,813. You are in favour of a uniform scale of compensation for manures—a proportionate part of the cost?—I am in favour of it. But as you are aware the recommendation which I wished to put in this report only went as far as feeding stuffs. One or two of the committee, Mr. Reade especially, were of opinion that for manures we could not arrive at a uniform basis so satisfactorily as for feeding stuffs.

20,814. Manures were rather different from feeding stuffs?—So the committee thought, but for myself, I am of opinion that we might have raised up a basis equally satisfactory for manures.

20,815. You prefer the uniform scale. Is that because both landlords and tenants are satisfied that it is a convenient basis, or because you think it is absolutely just?—Both reasons. It cannot be questioned that every tenant is in a better position to know definitely before he spends his money what he will receive.

20,816. In adopting a uniform scale I suppose you lay down a basis which is a maximum?—That is so.

20,817. A bad use of the material would diminish the compensation?—It ought to be so.

20,818. It is intended as a maximum?—Well preserved in every way.

20,819. Feeding stuffs used judiciously, and the manure properly taken care of?—Properly taken care of.

Mr. W. Lipscomb.

24 May 1894.

20,820. It has been urged here that a uniform scale of compensation acts unfairly to the tenant who has continued the use of feeding stuffs for a considerable period; that there is more left in the land than he is compensated for, and that it is not fair to give him no more than a man who has only used them for two or three years?—That has been frequently urged; and the recommendation which came from the Newcastle Farmers' Club, and which is in the Appendix here, was to meet that, and it was admirably met, and that is the graduation of each farm on a scale, so that what you spoke of being improperly preserved was that a manure heap which is allowed to be washed and so forth he would receive on a lower scale, and what we recommend should be the maximum.

20,821. The inequalities of a uniform scale would be redressed by a system of gradation of holdings?—Yes.

20,822. The compensation being given on the highest scale to the best farmed land, and on the lowest scale to the worst farmed land?—Yes.

Awards outside the Act.

20,823. With regard to procedure under the Act, I presume that you do not intend to apply your scheme to arbitrations outside of the Act, for ordinary tillages and crops?—Of course the Act has that in view when it states that articles not specifically put in the schedules are not to be affected. You are aware of the clause; and as a matter of course the time of entry must largely regulate the amount which the incoming tenant must pay to the outgoing tenant for works of cultivation, and they are impossible to know exactly.

20,824. Are you not aware that lawyers recommend that two separate awards, or two concurrent awards, should be made, the one for compensation under the Act, and the other for compensation for things not included in the Act, and that they become, where there is no substituted agreement, separate awards?—No, I never heard that crystallised in that shape as you put it. It goes without saying that the clause in the Act has reference to all proper outlays for which the outgoing tenant should be compensated, the particular words are, no doubt, familiar to everybody. I remember having to point that out.

20,825. If I may refer to my own experience, I have been advised always where I have sat as umpire, and questions have been brought before me, partly under the Act and partly not under the Act, that is to say for tillages and crops, to make two separate and concurrent awards?—I can easily understand that can be so worked that you are absolutely bound by the Act under certain heads, and the other is outside.

20,826. Is not there a recent case which clearly distinguishes between what was awarded under the Act and what was not awarded under the Act—I think it was the Farquharson case?—I am not acquainted with it.

20,827. The county court judge proceeded to put the award in execution, and it was decided that he had no power beyond the Act; he could not put that part of the award which was not under the Act into force?—The agility of the lawyer would be able to do that I can see.

20,828. The point I urge is this: That in an enormous number of cases, the largest amount of money passing to the outgoing tenant is in respect of roots, and hay, and straw, which the incoming tenant takes possession of?—Quite so.

20,829. And the claim under the Act is very small?—Particularly in grass, where the hay and manure might be all.

20,830. Would you apply this system of an official umpire in those cases, and have an umpire appointed by the Board of Agriculture?—I think my object being to reduce costs, I should say it was as fair to have only one award.

20,831. It has been suggested by Mr. Druce, whom we had before us the other day, that a clause might be inserted in an amending Act authorising an award for both these purposes, and doing away with the two awards?—I think it would be most desirable.

20,832. To amalgamate the whole?—Yes, so as to cover the possible objections you have given me to understand there have been.

Valuers.

20,833. With regard to two or three valuers being employed to do the work of one, is it not the case that a great many farmers are under the necessity of having some one to advocate their cause and put their claim in order?—The great majority must be advised how to proceed.

Mr. W. Lipscomb.
24 May 1894.

20,834. There is not one farmer in ten who can formulate his claim without assistance, is not that so?—Quite so.

20,835. And if you did away with the two valuers the farmers would still want their advisers and advocates?—Yes.

Highways.

20,836. With regard to highways you of course are aware that the parochial highways will be now managed by district councils after the Act comes into operation?—Necessarily.

20,837. It may be postponed for a time?—I thought parish councils had something to do.

20,838. The whole management of the highways will after a limited period be by district councils?—Well that would not remove my objection.

20,839. You would prefer the county council to the district council?—I would prefer the county council to have the real direction of affairs.

20,840. Do you think that if different districts and different parishes had their roads on a fair level of efficiency they could be at once amalgamated under one management and become a common charge?—I do.

20,841. You think there is sufficient uniformity of conditions?—I think that it should be introduced.

20,842. Would it be fair; supposing one parish or one district has always maintained its roads in a good state and another has neglected them the effect of putting them all under the county council management would be I suppose a common charge for the whole of them?—My recommendation was that the common charge should be an imperial charge.

20,843. If we do not get that, and there is only a common charge, might it not be a great injustice to particular districts or parishes to make their roads a common charge with other parishes which do not spend any money on their roads?—If the funds were to be collected locally do I understand you to mean that.

20,844. Yes?—I certainly see a very great difficulty; but I had no idea in recommending what I did but that the money should come from the County Council.

20,845. Then it is an essential part of your road management scheme that a great amount should come out of the Imperial fund?—Out of the County Council funds and supplemented by a larger subvention.

20,846. The subvention now in respect of roads is not ear-marked for roads; it is part of a general subvention—it is part of a general amount paid over?—Yes.

20,847. (*Mr. Dalton.*) When you recommend that the whole of the highways should come under the county management you include those in urban districts?—Yes.

20,848. You have got a great many urban districts in the West Riding of course?—Yes.

20,849. You have for instance the borough of Dewsbury with 30,000 inhabitants?—Yes.

20,850. Do you propose to put the whole of their roads and highways under the county?—Yes.

20,851. What do you think that the town council would think of that?—There is the difficulty. I am perfectly well aware in dealing with large towns that the principal difficulty in all these things occurs but I do not quite see how you are to eliminate that.

20,852. At present Dewsbury gets nothing from the county for main roads. It is a cause of great complaint on the part of the Corporation?—Nothing.

20,853. I think that it has no main roads. It contributes to the main roads in the county but has no main roads of its own, I believe that is the case?—I am not aware of that.

20,854. There was a recent return moved for by Mr. Oldroyd, who is member for Dewsbury, which was intended to bring out that fact, amongst other things, but in some parts of the country you know there is a good deal of feeling on the part of some towns that they have not got their fair share—whether rightly or wrongly—that they have not got a sufficient number of their roads maintained by the county; that they contribute to the county roads but that they have not got many main roads of their own?—I understood you to say before that that they got nothing.

20,855. Dewsbury gets nothing; but there are other towns which get a certain proportion according to the amount of the main roads in each urban district?—It is the excessive difficulty of dealing fairly as between town and country, that one knows that it is a very difficult question to settle.

20,856. But would not that be an almost insuperable difficulty in the way of bringing the whole of the roads under the County Council?—I think that it was a very great difficulty: I am not prepared to say off-hand that it should be done; but I am only looking on the great change for the better for a great many years, and by degrees a very much better system was introduced by county management.

Mr. W. Lipscomb.
4 May 1894.

20,857. With regard to subventions. Supposing you had a fair system of charging for the roads in Yorkshire; is there any reason why the Yorkshire roads should be paid out of the Imperial funds and not by funds collected in Yorkshire?—The reason I gave that opinion was this: I was asked what I had to suggest as a remedy for agricultural depression; and that as I was not prepared to recommend anything in the shape of protection, and I thought there ought to be a revision of rates; and that therefore if the highway rate was met by an Imperial fund that that would be a direct relief.

20,858. It would be an immense subvention you would require not only to pay for the rural roads in Yorkshire, but also to pay for all the roads in the towns—all the urban roads?—I must confess that I had not had in view the addition of urban roads. I am not prepared to say that urban roads ought to be treated in the same way, because one of the great expenses of the agricultural districts is because the towns are using the roads without any contribution.

20,859. And it is quite possible that if all the urban roads were paid out of a common county fund agricultural lands would have to contribute more than they do at present, because of the great expense of the town roads, if the town roads were included?—I am not prepared to assert that it might be a necessary consequence.

20,860. It might be so?—It might be so.

20,861. The number of miles of roads in a large town is very large. They are not merely through roads, and they are paved and laid out in a totally different manner from a country road?—I do not see that they are on the same basis.

20,862. But that would be a very great difficulty in the way of bringing a great number of the highways under the county management?—Taking all roads there might be a uniform allowance which would exclude the immense addition which granite-made roads and paved roads makes because it would apply to footpaths especially.

Adulteration.

20,863. Then as to adulteration. Does your County Council systematically enforce the Sale of Food and Drugs Acts throughout the county, or was that case where they took up the prosecution an exceptional one?—The inspectors are fairly active in the County Council, but the urban authorities are extremely indifferent.

20,864. What remedy would you propose for that? It is very difficult to try to force any authority to take proceedings under an Act of that kind?—I think all our sanitary requirements, all the sanitary provisions, require looking into. I think there is no reason why there should not be from the Local Government Board or some other Government authority an inspection to see that the Acts are observed. I do not see why they should not be upheld at any rate by showing that neglect is going on.

20,865. But that practically takes place already. Every public analyst has to make a report under the Act, and that is annually published and laid before Parliament, so that you can ascertain how far those Acts are being enforced in every district. Can you do much more?—Yes, they should show how many inspections are made.

20,866. They show how many samples have been taken, and not only do they show how many samples have been taken, but how many have been found adulterated and how many have not?—I am not aware that that is made public.

20,867. That is in the annual report to the Local Government Board?—And then they must lie there.

20,868. That part of the report is reprinted and circulated amongst some of the authorities as a separate document. It shows of course that the amount of proceedings taken in different districts is very different. But you were rather thinking of agricultural produce?—I had only reference to that.

20,869. Is not it possible for some association to take that matter up? Any private individual can take proceedings under the Act. Is not it possible for an association to proceed against the adulteration of food, or lard, or anything of that kind?—Yes, I suppose there is nothing to prevent it; just in the same way as it would be for the purification

Mr. W. Lipscomb. 24 May 1894.

of rivers or purification of the air and smoke. I was instrumental in instituting, and was president for a long time, of one of those associations to try to get rid of the smoke nuisance; but unless authorities in power will take these things up you will find it an uphill game which cannot last; and what I hope for if it is found worth while, is to have an Act of Parliament for the special purpose of having more care taken to see that it is carried out than there is at present.

Succession duty.

20,870. Then with regard to the succession duty, 10 per cent. I think was payable in the cases that you were referring to, and under this 10 per cent. it came to one year's rental?—In the last instance of a very aged gentleman.

20,871. But in an ordinary case where it would be an ordinary succession, it would be 2 or 3 per cent. which would be paid?—It is according to the age.

20,872. The difference would be something less than the third of the year's income instead of the whole of the year's income. Was that money paid out of the income of the year or was it raised from an Insurance Company or otherwise, which would be the usual practice?—I cannot speak of the usual practice; but in this particular instance it was paid out of the income.

20,873. And you say it led to the discharge of a considerable number of labourers?—Yes.

20,874. Can you give the figures?—No.

20,875. Could you give any estimate of the number of labourers thrown out of employment?—I could not tell.

20,876. There would be none thrown out in Yorkshire?—Yes. Supposing I had a gang of 10 men, I should knock off at least half directly. It was in that way. I should not be able to give more than that.

20,877. You could not give any precise figures?—No.

20,878. Nor as to the subscriptions?—No.

Rates.

20,879. (*Mr. Channing.*) I suppose your opinion is that personalty does not pay enough in rating; do you hold that opinion that personalty ought to contribute indirectly more largely than it does now to local rating?—Yes.

20,880. Have you had much experience in assessment?—None; I have not been on an Assessment Committee.

Adulteration.

20,881. You have expressed a strong opinion about adulteration. Have you any suggestion as to the better enforcement of the Acts? Do you think that the county councils would be sufficient if you made them supreme throughout the whole country; or would you place the matter in the hands of the Local Government Board or the Board of Agriculture or some other central department?—The county councils could not take action in boroughs which were county council boroughs. So far as I understand the whole procedure of the Acts, they could not pretend to go into the county council borough; and therefore it would need the Government Department which I think ought in all cases of sanitation, in which I include adulteration, to see by constant inspection that the Acts are being carried out.

20,882. The borough county councils you think would be rather lukewarm in the matter?—They are so at the present time. But when you ask me if the county councils should have this, I do not think that the county councils proper would be able to go by their powers into the borough county councils.

20,883. No, they would not. I was thinking of the case of the local boards, the district boards?—That is where they do so now.

20,884. Do you think those sufficient; do ou think that a central authority is better?—I think hat a central authority should be able to report themselves.

Agricultural education. Dairying.

20,885. Now about this dairy teaching; do you think that it is leading to a better organisation of the butter trade; that is, do they turn out butter of a more uniform quality which will compete better with foreign butter?—Unquestionably, the travelling dairies have been of great value; but I think there may be a great deal more done in the way of co-operative dealing on the part of farmers. As perhaps you are aware, we have had a report by the Central Chamber considering that question of co-operation.

20,886. Do you look forward to success in the way of organisation of the dairy trade generally so as to compete with foreign importations?—It is a very difficult question to say how far we can bring farmers to co-operate. The produce is distinctly better; and the usual way now is for them to take it individually into the market, and having a better quality they sustain their price; but where the saving can be effected by having large dealers who would collect butter as is done in some districts, unquestionably that would save consider able labour and a per-centage of the individual dealing.

Mr. W. Lipscomb. 24 May 1894.

20,887. Have you tried the factory system in Yorkshire?—To some extent, Mr. Fawkes, of Farnley, in our district, has done so, and I visited it the other day.

20,888. Is that successful?—It is not successful to the extent that Mr. Fawkes had hoped.

20,889. Is that owing to the unwillingness of the farmers to combine?—Partly to that, and partly owing to the difficulty of competing with shopkeepers who are on the spot.

Succession duty.

20,890. Now about the estate duties; have you considered the question of life insurance in relation to the estate duty?—I have not.

20,891. I suppose you are aware that the various insurance companies have issued papers showing the amount which will be necessary to insure the estate duty at the various scales proposed in the budget?—I only know that they have done so, but I have not examined them.

20,892. Are you aware that taking the greatest age given a man of 50 who has to leave a landed estate worth 50,000*l.* can insure against the estate duty for 109*l.* a year?—No, I have not seen the table.

20,893. But supposing an estate to be worth 50,000*l.* what would you put the average net rental of the estate at in the present state of agriculture in your own neighbourhood?—That question brings out the enormous difficulty which has presented itself to me. What I have stated before the committee shows that what I have been dealing with elsewhere has been in a great degree prospective, and hence the capital value would be so inordinately in excess of the existing income that upon the tenant-for-life it would not be a fair imposition. That is the difficulty. If you went into a purely rural district where the rental was the sole indication of value, you could arrive at a "fair" result.

20,894. But a net rental on 1,000*l.* a year on property worth 50,000*l.* would be a low estimate would it not?—It would depend entirely upon the district. It is impossible to form an idea or say what might be considered, in an expert's opinion, saleable value unless you know the precise district.

20,895. If you take the net rental as low as 1,000*l.* a year on 50,000*l.*, 109*l.* would be more than one tenth of his income. It would provide for the proposed succession duty?—I have not seen the proposals of the companies.

20,896. But you would not think that paying 10 per cent. out of the net income would be a tremendous undertaking for a landowner aged 50, which is the highest rate of premium?—For his life.

20,897. Yes, it would not be exorbitant to take one-tenth of his income in order to leave it free?—I know that one-tenth of the income, if he has a house, just makes all the difference to the labour in his district—just all the difference.

20,898. Have you formed any opinion as to the suggestion made by Mr. Chaplin that this estate duty might be paid in land instead of money—have you formed any opinion?—That is by far the greatest relief that could be afforded—in the same way that Lord Cairn's Act has enabled the tenant-for-life to sell for improvements—it is an enormous relief; and I think that is quite the best suggestion.

20,899. Then it would promote a matter in which you are deeply interested, that is the promotion of small holdings?—I do not think that you will promote small holdings by any means at the present time.

20,900. Not if you have parcels taken off the estate to pay the estate duty?—I am perfectly certain that at the present time no one will buy land as an investment except for the prospective value commercially. I am certain that agricultural land will not be taken for small holdings.

The Agricultural Holdings Act. Compensation for improvements.

20,901. With reference to the Agricultural Holdings Act and as to the recommendations of the Central Chamber Committee, you are aware, are you not, that among the members of the Central Chamber there was a very strong opinion in favour of putting most of those first class improvements which are made with the consent of the landlord, in the position of improvements which could be executed and compensation obtained for them if on a reference they were shown to be of value to the holding; that is that a tenant should be compensated on either ground, that his landlord had consented, or that the reference shows that the improvement was calculated to

Mr. W. Lipscomb. 24 May 1894.

improve the value of the holding?—It was on the assumption that there was an official who was ready of access and who had capacity of being referred to; it was supposed that that was established first of all.

20,902. That you had an official referree of the character which we afterwards agreed upon?—Of such a character. We did not come to any conclusion as to how it was to be established. It is quite different to have an umpire for valuation. It was supposed that we should go to headquarters and should be able to have a referee; then it was suggested by a minority that instead of requiring, or rather in the absence of consent being given, that he should have the power of appealing to the referee so constituted to show whether or not his requirement of putting up these permanent improvements was a reasonable one, and in such a case it was to be equivalent to the consent of the landlord.

20,903. As a matter of fact that proposal was originally adopted and then finally rejected in the final stage of the committee?—That is so.

Compensation for disturbance.

20,904. There was also a very strong opinion expressed that where a farmer was taken out of his holding capriciously or unreasonably he should have some additional compensation or allowance for disturbance, was there not?—For the loss he sustained by removal.

20,905. For the loss he sustained by removal?—Those were the words which seemed to obtain most assent.

20,906. There was a strong feeling in favour of that; and this again was one of the points which was omitted at the final stage of our report?—It was overruled.

Valuers and umpires.

20,907. Yes, by a small majority. Mr. Gilmour asked you about the use of a single referee to decide agricultural compensations. Are you aware that in the Bill which I have had before the House of Commons, I suggested that the procedure should be this: that a single referee should be appointed; where the parties did not agree that there should be two referees—would that meet your view? As I understood your answer to Mr. Gilmour, it was that you thought farmers would wish to have a free hand to choose two valuers if they preferred it?—Yes, I think they would distinctly object to a compulsory enactment that they should not have their own choice in the first instance. But, as Mr. Little has stated, very few tenants are themselves capable of putting their claim into a formal shape of any sort, and that claim must be put in before there is a power of an umpire or referee to act. He could not ask the referee who is to be the umpire between the two to come to his house and have a friendly talk and tell him how to put his claim into shape; and it would be very hard upon a man who could not do that. Therefore, in the first instance, the initial stage should be left to them.

20,908. Your opinion is that possibly if you had a high class official valuer or umpire that at some future stage the English farmer may be educated to the point of view of wishing to submit his claim to this single umpire and have done with it; but at present they each prefer having their own valuer?—I think in all cases in the practical working of the thing he would wish to have his claim drawn up by men more competent than himself. Then if I had to decide upon the claim; I should be only too glad if the first initial man were entirely set aside, and that the umpire should be called in at once.

20,909. Of course the object of my suggestion was the same object as in the Scotch Act, which was passed in 1889, that is to cheapen the procedure by having one step and one referee to settle the whole matter?—But still in Scotland they must send in a claim, and that referee in Scotland would not be the person to draw up the claim. You must draw up the claim before you have it adjudicated. But that is not an expensive thing, the first sending in.

20,910. Now the committee agreed to recommend that there should be those official valuers as umpires approved by the Board of Agriculture. I should like to ask you how we should get these official valuers. Do you think that they should be nominated by the Board of Agriculture, or the county councils themselves?—We state *in extenso* the recommendation. I am quite prepared to recommend those identical words.

20,911. Nominated by the county council?—No, nominated by the county council first of all, and then approved by the Board of Agriculture.

20,912. Those are the words, practically, of the proposal contained in my Bill; but what I mean is, where shall we find those men? You yourself think the average valuer does not know much about the Acts?—The county councils are to be the judges of that; they would know the best men, and they would eliminate all those who were not worthy of the sanction of the Board of Agriculture.

Mr. W. Lipscomb. 24 Nov. 189[illegible]

20,913. Do you think the Surveyors' Institute and their arrangements afford you sufficient tests?—There are a great many men who belong to the Institution who do not act as valuers. I only wish and hope that their influence may extend; and I had that in view when recommending these very things. I had in view that their Institution might gain more and more in public esteem and that they should be more and more particular also in their future appointments.

20,914. Men of that kind have the requisite knowledge and requisite status to deal with the matter which you contemplate, have they not?—Yes; and I hope that the *esprit de corps* might increase so as to get rid of a vast deal of what I think is a discredit to the valuers who now exist.

20,915. (*Mr. Little.*) In what way?—A great number of men act as valuers whom the Institute of Surveyors would not have appointed.

Compensation for consumption of home-grown corn.

20,916. (*Mr. Channing.*) There were a certain number of Chambers who did recommend, with regard to the corn consumed on the holding, that for the preceding year there should be an allowance as well as for the last year. I see five Chambers recommended nothing, and seven Chambers recommended that there should be one-sixth, one eighth, or one twelfth given for the preceding year; do you think that that would be unjust yourself?—I think that that would be very unwise.

20,917. It is not sufficient?—Not only that, but the extreme difficulty of substantiating the claim. All those acquainted with valuing know that there has been a very great objection to this home-grown corn being admitted. But I think now the time has come when in the last year it might be substantiated by the man taking pains to let his intention be known that his claim should be fairly substantiated. If you go to two years it would be enormously increasing the difficulty, it would be only one-twelfth.

20,918. (*Mr. Little.*) You would have to amend the Act in this respect in order to make it applicable only to the last year; there is no limitation under the Act?—No. Of course this would be introducing a new item in the schedule and it would be limited to one year.

20,919. But is the recommendation of the Central Chamber that compensation shall be limited to what is "consumed in the last year." I am not speaking of the previous recommendation, but the recommendation which is now put before us?—Yes.

20,920. (*Mr. Channing.*) But this is a point which wants clearing up. Our committee has not recommended any fixed time whatever with regard to compensation?—No.

20,921. If I remember right that was the point, the compensation on outlay was discussed and finally rejected?—Satisfactory evidence to be adduced of the same is the only qualification.

20,922. (*Mr. Little.*) If you wish to confine it to one year's consumption it must be by an amendment of the Act?—That would be so; I do not know that it would be desirable at all to prohibit, but I am only speaking of what would be a recommendation if this original report of the basis of valuation was extended, not what would be compulsory in an Act, but only a recommendation.

Valuers.

20,923. (*Captain Owen Thomas.*) With reference to the claims would you fully approve of either landlord or tenant having valuers or referees?—I am not quite sure whether you may not have two men who are very reasonable and are satisfied with each others views—they would not need to go to an umpire. My object particularly is to get at the least possible cost a fair adjudication; and sometimes two men are fair men and agree; but more often one man is so unreasonable that the sooner you go to the umpire the better, so as to get rid of the constant meetings, which is one of the causes of the trouble.

20,924. Do you think that the valuers as a rule endeavour to act fairly towards the landlord as well as the tenant?—The landlord is always represented, and one of the valuers would see that he is done fairly by.

20,925. There is an impression that valuers, as a rule, favour the tenants; is that your opinion?—The class from which the ordinary valuer comes, one would naturally expect that the bias would be towards the tenant. I do not hesitate to say that the natural bias would be so; but

Mr. W. Lipscomb.
24 May 1894.

with the highest class of valuer I am perfectly certain that he would hold a level scale in dealing with either claim.

20,926. I understood you to say that you reduced rents about 25 per cent. on the estate that you manage?—Yes.

Reduction of rent.

20,927. Are the tenants satisfied with the reductions you have made?—I am glad to say that I have had the most perfect good will in dealing with the tenantry, and I have substantial proof of it. But to say that they are satisfied cannot be applied to this or any tenantry in the kingdom. They are in a grievous state of doubt as to how to go on; but they know that the landlord is equally hard hit, and every reasonable concession has been made; and we are endeavouring to go on year by year by an increased expenditure so as to give the tenants a better means still of making their holdings answer.

20,928. Are they paying you what you consider a fair economical rent for the land?—Yes.

20,929. Not more?—Not more; and I would not ask more; and if I were compelled to ask more I would vacate my position.

20,930. Are you aware that a number of tenant farmers are paying 10, 20, and 25 per cent. more than the value of their land at present?—I am not aware of that.

20,931. I happen to know of an estate or two, and I was going to ask you what remedy these tenants can have. They have asked their landlord for a reduction and he will not give any?—If I was asked to go to a farm and give my own opinion upon it I should be better able to answer that question; but as a broad economical question as to men who are paying more than the value of their land, I cannot suggest any remedy more than any man in the street, who could answer it as well as I could. There is no heaven born remedy; if a man gives it up and it is not worth then what he is paying, it seems to me quite clear that no other tenant will succeed to it.

20,932. But you know that it is not an easy matter; that a man considers twice before leaving a farm, whether he is losing or not?—There are some cases of great hardship in every relation of life where men have been obliged to leave, and where they might have been left on. I am quite aware that there are cases. I am quite sure that in the long run that owner will suffer as he deserves.

Judicial rents.

20,933. You have already said that you approve of the principle of referring claims of compensation to valuers or referees; why not apply the same principle to the fixing of fair rents in cases where landlords and tenants cannot agree?—Well, that of course is the old Irish system, of which I entirely disapprove. You at once endorse the dual ownership, with all its concomitant evils, and I am perfectly sure that although there may be a few cases of unmerited hardship, as a rule it would be a very bad system attended with a very large expense; and I do not know who would have to pay for it.

Mr. W. Lipscomb.
24 May 1894.

20,934. Just as in the case of claims for compensation; if landlord and tenant cannot agree it might be referred to arbitration, and why cannot the same thing be done for rent?—But to make it equitable you must make a court for fixing the rents. For instance, a man, for whom I have done a great deal; I go to him and I say, "I expect you to pay 50*l.* a year more rent," and he says, "No, I will not;" then I have a right to go to the court to see if he is paying enough.

20,935. Well, the decision of the court would be perfectly fair?—But I do not think that that is usually contemplated; it is always contemplated on one side, and I do not think that it is possible to make it, unless you make it fair to both.

Compensation for consumption of home-grown corn.

20,936. (*Mr. Little.*) The valuer under present circumstances has frequently to inquire as to feeding stuffs in order to satisfy himself that they have been consumed, I suppose?—He is expected to find the voucher.

20,937. And besides the voucher, has he not, in the case of two occupations used by the same man, often to go into such questions as the number of stock kept, and the character of that stock, and it would be only an extension of that, his inquiring into the home-grown corn consumed?—That would be so.

20,938. If he should be satisfied that a certain number of stock were kept on the farm, that would be sufficient to account for the amount consumed?—But there is nothing like a settled bill to settle the value.

20,939. No; but if you establish by witnesses that a number of stock were fed upon wheat for a certain time, that would go a long way to prove the consumption of a certain quantity of wheat?—I think so.

20,940. Whether grown by the farmer himself or another would not matter?—No.

20,941–3. Though there may be a difficulty it is one that a capable valuer would overcome?—Besides it is the tenant's business.

20,944. Throwing the onus of proof upon the tenant, no hardship would be entailed upon the landlord in having to pay the manurial value of that which has been proved to have been consumed?—No. The objection to giving compensation for home-grown corn is the great opportunity it gives for fraud. Allegations may be made by an unscrupulous man for which an incoming tenant may be charged.

The witness withdrew.

Adjourned till to-morrow at 12 o'clock.

Thirty-ninth Day.

Friday, 25th May 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., *Assistant Secretary.*

Rev. A. L. Sparkes, M.A., B.Sc.
25 May 1894.

The Rev. A. L. SPARKES, M.A., B.Sc., called and examined.

20,945. (*Viscount Cobham.*) I think you are a beneficed clergyman in the county of Leicester?—Yes, I am vicar of Worthington, near Ashby-de-la-Zouch.

20,946. And you are here as representing the Leicestershire Farmers' Union?—Yes.

20,947. Is that a large Association?—There were 1,500 members in it at Christmas when the subscriptions were paid, and I was the founder of that Union.

20,948. Does it consist of Leicestershire farmers exclusively?—Yes.

Rev. A. L. Sparkes, M.A., B.Sc.

25 May 1894.

20,949. Do you know how many acres they represent?—No, I do not.

20,950. (*Sir Nigel Kingscote.*) Are they all tenant farmers?—Yes, they are all tenant farmers.

20,951. (*Viscount Cobham.*) I believe you received scientific training, but you are not a practical farmer?—I am not a practical farmer. I was trained in London and received a scientific education, and partly in other places. I took the degree of B.Sc. in London University in botany, geology, and chemistry, and those are the chief sciences concerned in agriculture. I have trained pupils for examination in the scientific principles of agriculture, and when the Adulteration of Foods and Drugs Act came into force I was a layman, and then I was at the head of the scientific departments of various institutions in Staffordshire, of which the present financial secretary of the War Office was the chairman, Mr. Woodall. I was also chemist to the British Gas Light Company's Works in North Staffordshire, and was one of the first appointed analysts for the borough by the Corporation of Hanley. My scientific training has led me to observe more carefully than those who have not possessed that scientific training, and it has helped me to form correct inferences of what I have seen in different parts of the world.

20,952. Have you travelled with the view of investigating agricultural problems?—Not specially with that object. I was chaplain to the railway companies in South America. I travelled over the Barley Estancias on the northern side of the Pampas, and on the rice and sugar fields at Salta. I have been a good deal also on the Continent and I have learned sufficient of practical farming in my travels to satisfy me that the land of England is cultivated better than that of Ireland, and the land of Normandy is cultivated better than either of them.

20,953. How long have you been in Leicestershire?—It is my native county, but I was away from it a good many years. I have been back in Leicestershire now four years, and my direct interest in agriculture began when I was appointed to the vicarage of Worthington, two years last January. I was a landlord for the first time by my induction to the living.

Railway rates for milk.

20,954. You do not farm your glebe?—No, I let it. I found that half the inhabitants of the parish were engaged in agriculture, and the farms were from 50 to 250 acres: they all send their milk away, some to London and some to Newcastle-on-Tyne. In my investigations on milk rates I found that 40 cans or churns were sent from the parish every day. The farmers thought then that the sending away of milk was the only profitable part of their business, and I think one reason why they have that impression is that the returns are so quick; they are paid for their milk 12 times a year, and they turn over a certain part of their money 12 times a year; that is the reason why it pays so well.

20,955. Was there an increase in the milk rates in 1893?—There is no increase in the milk rates now. We fought the railway companies, and the rates for milk now are just the same as in 1892.

20,956. You took a considerable part in the agitation, and that has given you some insight into tenant farming in Leicestershire?—I felt a great deal of sympathy for my flock who were oppressed with these rates. If they had not been successfully resisted they would have increased the carriage nearly 50 per cent.

Condition of farmers in Leicestershire.

20,957. Have you seen much of England with a view to ascertain the amount of depression in various parts of it? Yes, I know Northumberland very well, but Leicestershire is the only county which I think I know thoroughly.

20,958. What has been the result of your inquiries in Leicestershire?—My impression is that 20 tenant farmers could not be found who are in a fairly good position, all through the county.

20,959. But comparing them with other counties how does Leicestershire stand?—I think in Leicestershire that the depression is not so acute as in some other counties. I have been occasionally down into Essex, and the depression in Leicestershire is not anything like so acute as it is there.

Reduction of rent.

20,960–1. You calculate the general reduction of rent at 25 per cent.?—It is about 25 per cent.

Land in hand.

20,962. Landlords have suffered in other respects also, have they not?—They have suffered also in having land left upon their hands, and that land is greatly increasing now.

20,963. Has that as a rule been a loss to them?—Yes, in all cases that I know. One gentleman whom I know very intimately has had two farms upon his hands for two years, and cultivated them himself; they were both 250 acres, and in making up a balance sheet of his profit and loss he has found that he has lost 700*l.* in two years.

Rev. A. L. Sparkes, M.A., B.Sc.

25 May 1894.

20,964. They were no doubt taken over in a very bad state of cultivation?—Probably they might have been.

Landlord's outlay.

20,965. Have the landlords incurred losses by being obliged to incur a heavy outlay, for which they have received no interest, in the hope of keeping up their estates?—Some few landlords have been very liberal in making permanent improvements, but I do not think that landlords generally in Leicestershire have been liberal at all in that respect. I know one case well, where a farmer pays 950*l.* a year rent. He keeps 51 cows, and when I visited his house I could have put my hand between the windows and the wall in several of the rooms.

20,966. Is that on a large estate?—That is on a very large estate indeed, and that farmer pays 950*l.* a year rent, and has taken more prizes for good cultivation than any other man in the county of Leicestershire. Yet he could not get his owner to put his windows straight for him. If I were to venture upon any description of the dairy where the milk of 51 cows is taken, I think I should surprise you all at the condition in which that dairy is.

Condition of dairies.

20,967. Is that the case generally throughout the county?—No, as a rule the dairies are in a good condition. That is an exceptional case. The dairy is not more than about 12 feet square, as far as I can estimate. It is a very bad floor for his wife to stand upon. He has made repeated applications to his owner to make a suitable dairy for his farm, and to repair his house, but in all cases that has been refused.

20,968. That is an exceptional case?—That is an exceptional case so far as the dairies go.

Value of land.

20,969. Has there been a great decline in the value of land?—Undoubtedly; the information I have upon that is hearsay. I have made inquiries from land agents and auctioneers who have told me that the land of Leicestershire would not fetch in the market half what it would even five years ago.

20,970. Although rents have not fallen to the same extent?—Not to the same extent.

Position the clergy in Leicestershire.

20,971. You probably know the position of the clergy of the county very well; have they suffered much?—I think the clergy have suffered most of all amongst landlords. In the first instance they have reduced their rents as much as other owners, and I am sorry to say that their tithes are only worth 75 per cent. now; and what is more, owing to the depressed condition of the farmers, the clergy do not get the same help in their collections to increase their stipends as they used to do. In my case two years ago the farmers subscribed 17*l.* a year to increase the stipend of the vicar, but 12 months last Easter when the collection was made I only got 5*l.*, and it is not because I was unpopular, as you can easily understand from the action I took on the milk rates, but they could not afford to give anything, and last year I would not allow any collection to be made, so that I have lost 17*l.* in my income in that way. Then from another source I received 20*l.* a year; that has been reduced to 10*l.* That is the Rustats Charity. The income of the living of Worthington from that was 20*l.* a year, but the commissioners of that charity have been obliged to reduce it to 10*l.* on account of the shortness of funds.

20,972–3. Do many incumbents farm their own glebes?—I do not know any case. My own income when I went there was 140*l.* a year, and I estimate now that it is worth 105*l.* nett.

Character of farming.

20,974–5. How is the land being farmed—I mean as to the character of the farming; is it well maintained?—It is chiefly pasturage; there are some very good farmers in my parish and some very bad ones. I was looking at a field in my parish the other day which I estimated to be about 10 to 12 acres in area, and I noticed when the drill had been turned round the man who was making the drills omitted about a foot at each turn, and I calculated that by multiplying that by the number of times the drill had gone round that there would be a loss of half an acre in that field. As a rule the farms are well cultivated.

Land out of cultivation.

20,976. Do you know of any land out of cultivation?—I have sent a list of all the land unoccupied, and in the statistics I have given a summary of it. You will find it at page 2 of my summary of statistics as to the condition of agriculture in Leicestershire—"land unoccupied or taken in hand."

20,977. I was not including the land taken in hand but the land absolutely abandoned?—I do not know of any absolutely abandoned.

Rev. A. L. Sparkes, M.A., B.Sc.

25 May 1894.

20,978. In Leicestershire the land would always grow grass of a sort?—I do not think that any land has fallen below the margin of cultivation.

Competition for farms.

20,979. Is there still competition for farms?—Yes; but that is no evidence of absence of depression.

20,980. Did you not say that a great many landlords have got land in hand?—They cultivate it themselves.

20,981. Then there is no competition for those farms?—None; the landlords in that case want too much rent.

20,982. They could have let the land at a rent?—I certainly think so.

20,983. You say that you consider that competition for farms is not any evidence of absence of depression?—I do not think that it is any evidence of the absence of depression because farmers are rivetted to the land, their capital is sunk in it, and their knowledge is practically confined to it; they are not business men as a rule; they are anything but that. They cannot move their invested capital from land, and they cannot take it to any other channel of enterprise; they do not even keep books as a rule.

20,984. But competitors for farms have not their capital sunk in the land?—In many cases they have stayed on other farms till their capital has been almost exhausted.

20,985. Is it the case that farmers are training their sons up as farmers?—It is not generally the case in my parish.

20,986. Then how is the supply of competitors for farms kept up?—It is kept up from persons coming from other parishes and some from Scotland.

Scotch farmers in Leicestershire.

20,987. You have some Scotch farmers then?—We have not one in our parish, but I know a great many in the county.

20,988. Do you know how they are doing?—They tell me that Scotch farmers cannot make farms pay that other persons have left; but they go on till they have taken everything out of the farm that the farmer who has left has put in.

20,989. Do they farm in a manner to make it pay?—Yes; whenever I see a Scotch farmer I see him at work more like a labourer than anything else. A farmer cannot move from his farm to another channel of enterprise, as I said before, and the unrest shown by the change of farms appears to show a certain amount of depression. When a tenant moves from one farm to another he sometimes gets a new lease in life. Then another thing that acts on competition for farms is that when a tradesman has made money in his business, and, wants to retire, the first thing he thinks about is to find a farm to cultivate. That accounts for some part of the competition. Leicester is a very prosperous town indeed, and nearly all the manufacturers when they find they have made as much money as will enable them to retire, take a farm and try to cultivate it.

Competition for farms.

20,990. They give too much rent for it?—Yes, the rent is a matter of small consequence to them.

20,991. And that competition has maintained rents generally, or has assisted to do so?—That tends to keep rents high.

Law of distress.

20,992. Are there many small holdings, that is, under 50 acres, in Leicestershire?—I do not think there are. I think, if I might go back for a moment, I might say there is another thing which makes the unnatural competition for farms, and that is the present power of distraint that the landlord has. It seems to me that a landlord does not ask himself in the competition for farms who has the capital to cultivate a farm best, but he asks himself which man will pay the most rent. If he can only see that the high rent can be paid his power of distraint justifies him in accepting that man rather than a man with more capital, because the instant that the tenant has put stock upon the farm the landlord has practically a bill of sale upon that stock. That keeps up competition. The man with a small capital will offer a higher rent than a man with a large capital. A great deal of competition for farms is due to this.

20,993. Surely a man with the greater capital is the most likely to be able to maintain his payment of rent?—Yes, a man with a larger capital would very probably offer a smaller amount of rent; he would be more independent than a man with a smaller capital.

20,994. What alteration in the law of distraint would you suggest?—I should put the landowner upon the same level as any other creditor.

20,995. Of course the landlord would require his rent to be paid to the day in that case?—I do not see why he should not have the same power as anyone else in collecting what is due to him; but why should he have more power over the assets of a tenant than any other creditor.

Rev. A. L. Sparkes, M.A., B.Sc.

25 May 1894.

20,996. Would that reduce the competition for farms; is that a good thing, do you think?—Yes, I think that the power of distraint is altogether a bad thing for tenants.

20,997. My question is whether it is advisable to reduce competition for farms?—The repeal of the power of distraint would reduce it.

20,998. Would that be in the interest of the public?—It is in the interest of the tenant.

20,999. Would not more land go out of cultivation?—I do not see that it would. It appears to me that it would have a tendency to keep land in cultivation rather than otherwise.

21,000. You reduce the competition for farms to those men who are able to pay in advance; would not that be the case if the law of distraint were abolished?—No; I think that a man with a smaller capital would have a smaller farm, and a man with a larger capital would take a larger farm.

21,001. You think that although competition for farms would be reduced, still the farms would be taken?—Yes; not only that, but with regard to the law of distraint I know one or two cases where the power of distraint has been cruelly exercised.

Large and small farms compared.

21,002. Do you see much difference in the amount of depression weighing upon different classes of farmers?—I think large and small holders have suffered equally in the depression; but the depression is less apparent amongst small holders than large ones.

21,003–4. Is that because they do not charge for their own labour on their farms?—That is one reason. The small farmers are also more thrifty; the farmer does the work of one labourer himself, and the members of his family do work without receiving any money. I have an instance of that in my parish; a farmer has two sons and a daughter. When he was married he took the farm that he has now and stocked it with the money that he and his wife had saved by their industry before marriage—money paid by their parents. But if that farmer were to die now his children would not be able to take that farm and succeed him because they have worked so many years without any payment, they would not have the capital to do it, even if the parents had the same capital as they had when they began life together, when it was divided among the three children it would be insufficient for one of them to take that farm.

21,005. Small farmers are just able to make a living, I suppose?—They are just able with the work of their children—practically their sons and their daughters are maintaining them. If they were to pay their sons and their daughters for their labour they would not be able to support themselves.

Dairying

21,006. How is the dairy industry faring in Leicestershire?—The depression is less severe amongst dairy farmers who send the milk away; and least of all amongst those who are near enough to a town to supply the milk direct to the consumer.

Railway rates for milk.

21,007. Have you anything to add to what you have told us about the milk rates?—Well, the railway companies would not listen to us; and after the meeting had been held in my parish they would not even receive a deputation. I wrote to every Member of Parliament that I knew, and made a statement of the case, and that brought it under the notice of Mr. Mundella at the Board of Trade. We worked hard for two months against these rates, and the railway company threatened at one time that they would not carry the milk at all, but they did not carry that out for reasons I need not mention.

21,008. You mean by passenger train?—Yes; at the end of two months we so far gained our victory that the railway companies reduced the milk rates to the old standard, with the exception that 1*d.* per churn extra was placed upon it. But we objected to that; there was as much opposition to that as the raising of the rates before. But at the end of another month they came back to the old rates, and they refunded the whole of the money that they had charged for the excess rates for all the milk senders in Leicestershire.

21,009. Do you think that the farmers can afford to pay the present rates?—The present rates in Leicestershire are just the same as they were, but they are not so high

as in other parts of the country. The only railway companies who have reduced the rates to 1892 scale are those three lines running through Leicestershire, the Midland, the London and North-Western, and the Great Northern. I have collected for the use of the Commission all the milk rates in the whole of England.

21,010. I do not think that we can go into the general question of milk rates, but the present rate you consider a fair one?—It is satisfactory.

21,011. Have you any suggestions to make with regard to the milk rates, or any other portion of the dairy farming industry?—There are a number of suggestions I have written on my returns in regard to the mode of carrying the milk. I think that the milk should be in a closed vessel and not left open to be tampered with. The Adulteration Act is very stringent and every care should be taken in transit. I think it would be better to carry it in 10 lbs. instead of per gallon, and in sealed cans, so that the railway officials would not tamper with it. I know of more than one case in which consignees have found cups inside the cans; the cups being there one is obliged to draw a certain inference, which it is somewhat unpleasant to make.

Price of milk.

21,012. Have you any other suggestions to make with regard to the trade?—I think not in respect of the milk rates. I think the depression will shortly be as great amongst milk senders as amongst other farmers. The milk has decreased in price 1*d.* per gallon within the last 12 months in Leicestershire.

21,013-4. But that is since the rise of last year?—Yes; there was a special rise last year on account of the drought.

21,015. (*Mr. R. Giffen.*) What is the price now?—6*d.* per imperial gallon; the rise in price was only on account of the drought. I was at Richmond, in Surrey, in the middle of the summer, and I met a boy selling milk in the street. I asked him how much his milk was per quart, and he said 8*d.* I said, "How is it that it is so dear at "Richmond?" and he made the reply, "If you please, "sir, we have not any water."

Specially depressed districts.

21,016. Can you point out any areas of special depression in Leicestershire?—The areas of special depression are these: If a straight line were drawn from Wigston to Humberstone, another from Loughborough to Castle Donnington, and another from Castle Donnington to Breedon, and another line drawn round Hinckley, and then from Hinckley to Ashby-de-la-Zouch, that would pass over the most depressed parts of the county. I have been to every village in those districts to make inquiries.

21,017. To what do you attribute the severity of the depression in those districts?—In all these cases the depression is due to high rents. I found that many of the landlords have not reduced some of their rents for years.

21,018. On ordinary agricultural land?—Yes.

21,019. On large and small estates alike?—Yes, generally speaking. All round Hinckley there were a number of small occupiers; men who could scarcely be called farmers, because whilst cultivating a piece of land they are carriers, some of them keep shops, others are blacksmiths, and all have some means of livelihood besides cultivation of lands; I do not admit them as being farmers; I call them occupiers; nearly all these have been unfortunate.

Reductions of rent.

21,020. Do you know of large agricultural estates where they have not reduced their rents since 1879?—Not since 1879, but I could mention many farms that have not been reduced since 1883. I know there are many farms in which the rents have not been reduced. In the neighbourhood of Melton Mowbray and Belvoir I find that the tenants seem to be more satisfied than in any other part of the county, and rents there have been greatly reduced.

21,021. You say the reduction has been on an average 25 per cent. There must be many estates in which the reduction has been a great deal more?—Yes; I think the Duke of Rutland's is one of them.

21,022. Can you say from your own knowledge what the reduction has been?—I know in a few cases that it is more than 30 per cent.

Specially depressed districts.

21,023. Have you any other reason to bring forward to account for the special depression in some districts; is the land of a poorer quality?—The land is of a poorer quality in some places.

21,024. And of a more mixed cultivation?—Yes.

Depression amongst grass farmers.

21,025. Do the grass farmers suffer less than the mixed farmers?—Opinions do not agree on that subject in Leicestershire. The large farmers say that they have suffered the depression just in proportion to the quantity of land that they have. But I am obliged to disagree with them, because I find so many with large farms who are anxious to get the next piece of land adjoining to increase the size of their farms; therefore I do not think that they have suffered on account of the quantity of land they have, or they would not be ready to take more land.

21,026. Do the large grass-farmers go in much for dairying as well as feeding?—Yes, all of them, I think.

Tenant's capital.

21,027. There has been a considerable loss of capital, no doubt, amongst the farming class?—Yes, I think so; I think I can prove that from the Board of Agriculture's own returns.

21,028. We may take that as proved?—Yes.

Agricultural statistics, 1892 and 1893.

21,029. Can you point out the amount of loss?—I think I can approximately. Comparing 1892 and 1893 together, we find that in 1893 there were 1,035 acres laid down to pasture in the 12 months.

21,030. (*Mr. Lambert.*) Are you speaking entirely of Leicester?—Yes; we find though that quantity of land was laid down that the number of cows in milk and calf in 1893 was 1,842 less than in the year 1892. We find that the other cattle were 7,206 fewer than in 1892. We find there were fewer horses by 257, and we find also that the number of sheep has decreased in the 12 months to the number of 26,627. Pigs have decreased to 658. It appears to me very strong evidence that the tenants are getting short of funds, and that they are paying rent out of capital.

21,031. (*Viscount Cobham.*) Is not the decrease due to the exceptional conditions of last year?—The returns from which these calculations are made are dated the 5th of June; and on the 5th of June the drought had not had any serious effect upon farms. Comparing it with four years ago, we find in four years 6,704 acres laid down to pasture, but fewer cows than there were four years ago by 22; the number of sheep has decreased in the last four years by 2,058. That proves that the farmers have been paying rent out of capital for four years.

21,032. As to the stock generally, what are the figures?—That has gone down, although the number of acres of pasture has increased.

21,033. You have given the figures for cows and sheep, but not for other descriptions of stock?—I have given all the kinds of stock that are given in the returns of the Board of Agriculture.

21,034. Practically the number of cows remain the same; you say the number of sheep has diminished; has stock generally decreased? We have not got that, and we cannot tell what the general effect of the figures are without that. Farmers may have given up dairying and taken up feeding.

21,035. Do you mean for the last four years?—Yes. You will find the statement of four years ago in the returns I have sent up; but I do not find that any kind of cattle has increased in number in the returns. I have not the return with me for 1890, but they are in the manuscript of the statistics which were sent up to the Commission. We could soon find it out.

21,036-7. (*Mr. Lambert.*) What years are you comparing?—1892 and 1893.

21,038. You compare 1892 with 1893 and in that year there were 1,035 more acres in permanent pasture and 1,842 less cows kept?—Yes.

21,039. (*Viscount Cobham.*) But taking that comparison, you would not say that grass laid down in the first year would necessarily carry as many cattle as land retained in arable cultivation?—No; but there is not an equality between the two; there are not as many as before the 1,035 acres were laid down. There is evidently a loss of capital because the farmers have had to sell their stock to pay their rents.

21,040. If you could give the comparison for four years ago, it would be useful?—It would be very similar to what I have given for the two years.

21,041. (*Mr. Little.*) Do you compare 1882 or 1883 with the present time?—No; I have 1882 and 1883.

1882 and 1892.

21,042. I suppose you would say that 1882 was a period of comparative prosperity, as compared with 1892?—Yes.

Rev. A. L. Sparkes, M.A., B.Sc. 25 May 1894.

21,043. Then your figures would scarcely be convincing if the number of all sorts of cattle, horses, and sheep have increased since 1882?—I should expect them to increase to the amount of the land laid down to pasture.

21,044. But if the number of stock is an evidence of comparative prosperity, or of depression, an increase of stock since 1882 would show that 1892 was better than 1882?—If the increase were more than the additional land laid down.

21,045. You are aware probably that with the increase of grass land, the number of sheep generally decreases, that a larger quantity of sheep are kept on arable land than grass land?—Yes.

21,046. And therefore the comparison would be principally as regards cattle. I see that in 1882 there were 36,600 cows; and in 1892 there were 30,358 cows; but the whole number of cattle of all kinds was 144,000 in 1883, and 189,000 in 1893; sheep have increased from 277,000 in 1882 to 342,000 in 1893?—How much land was laid down in the period?

21,046*a*. I have not gone into that?—My impression is that 30,000 acres would be laid down in that period.

The currency.

21,047. (*Viscount Cobham.*) I see in your proof you mention the effect of the appreciation of gold, are you an expert on that question?—I have read a good deal of discussion on the subject. It appears to me that the appreciation of gold has had some effect upon the price of agricultural produce; but I see no reason why it should produce any more effect upon that than other imported articles.

21,048. (*Mr. Giffen.*) In what sense do you use the words "appreciation of gold"?—I mean this: At the present time two sovereigns will probably buy as much imported produce as three sovereigns would buy 20 years ago. That is the sense in which I mean the appreciation of gold. The purchasing power of gold has increased, and I think we are all agreed upon that subject in Leicestershire.

21,049. Then it is an effect and not a cause, is that what you say?—The appreciation of gold is an effect. I think it is the effect of two things if I may offer an opinion upon it. It is first of all the effect of too small a number of sovereigns being in circulation, and that is caused by two things, first of all the custom of wearing gold ornaments has used up a considerable quantity of gold; and another thing which is worthy of consideration is this: the general acceptance by other nations of our sovereign as a medium of exchange. I have travelled a good deal in South America, and I remember very well handing an English sovereign to pay my hotel bill at Salta (at that very remote place which is now so notorious), and the hotel keeper knew the value of it and gave me the correct change. I had a similar experience at Buenos Ayres.

21,050. In what sense do you mean that the appreciation of gold is a cause of low prices?—I have formed no opinion practically on the theory of bimetallism. I really do not understand it except that I believe the deficiency in the quantity of gold arises from the two causes mentioned.

Foreign competition and low prices.

21,051. (*Viscount Cobham.*) What meaning do you attach to foreign competition having an effect upon the present depression?—That is a matter of almost supreme importance in my mind. If low prices were the cause of depression, that depression would exist wherever low prices are, but that certainly is not the case.

21,052. You consider that low prices are almost wholly the effect of foreign competition?—Not wholly, but almost wholly.

21,053. (*Mr. Everett.*) Can you tell us where there is no depression, where they have low prices also?—I will tell you. I have the Statistical Abstract for the United States here. In 1873 in some States the average price of corn was the same as it is now, yet the quantity of land brought into cultivation in those places has increased enormously in the 20 years.

21,054. Before we go any further, I do not think that any gentleman sitting at this table can believe that statement, that the price of corn was as low in 1873 as it is to-day?—Well, those are the statistics.

Prices of corn in the United States.

21,055. (*Mr. Giffen.*) If you give the particulars will you mention the place and the prices?—I take the case of Minnesota. In 1873 the average price of corn was 41 cents per bushel.

21,056. What is the authority for that statement?—The Statistical Abstract of the United States. There are in this book columns of the numbers of bushels produced, and their value from which the calculations are made.

Rev. A. L. Sparkes, M.A., B.Sc. 25 May 1894.

21,057. In what way were the prices arrived at?—By dividing the prices realised by the number of bushels produced, which are given in this book.

21,058. How did you get the prices realised?—In 1873 the average price was 41 cents according to these returns.

21,059. How did they get it—how did they know the prices realised over a large space?—I get it from the United States Government statistics. They give the number of bushels produced in the States, and the value of those bushels on the spot.

21,060. How did they get at the value?—I cannot tell that. This is an official statement of the Government, and I am bound to take it as being correct.

21,061. (*Mr. Lambert.*) Can you give us a summary of it?—In 1873 the average price of corn was 41 cents per bushel; in 1883 it was 42 cents per bushel; and in 1893 it was 34 cents per bushel. There was a decline of 7 cents per bushel during the 20 years, and yet the land brought under cultivation was increased fourfold; therefore, those low prices must have paid the people of Minnesota.

21,062. (*Mr. Whitehead.*) I think you are giving us the figures for "corn," which means Indian corn, not wheat?—It includes all sorts of corn.

21,063. (*Viscount Cobham.*) "Corn" is Indian corn only, it is not wheat, you will see wheat under a separate head?—It is the corn crop. I do not think any other kind of corn is given separately in these statistics; I think all the corn is put together. But even if it is Indian corn alone, it supports my statement. There was four times as much land brought into cultivation in that State as in 1873.

21,064. (*Mr. Giffen.*) Was the price in 1873 the price in paper or in gold?—In gold, I should say.

21,065. Are you sure?—Yes, I think it would be in gold.

21,066. Was that not a time of inconvertible paper in the United States, when the gold was at a premium of 15 per cent.?—(*No answer.*)

21,067. (*Mr. Lambert.*) I see there is in this book the estimated product of the wheat crop; so, perhaps, you could give us similar figures for wheat?—They could only be calculated.

21,068. Would you put them in your evidence later?—I will do the calculation with pleasure, and send the figures for publication if you wish. In many other States prices were nearly as low in 1873 as in 1893, notably in Indiana, Iowa, and Delaware.

21,069. (*Viscount Cobham.*) Are you sure that you have got the wheat figures in what you have just been giving us?—I have taken "corn" as being the sum total of all cereal crops.

21,070. That is clearly a mistake. "Corn" is Indian corn exclusively. Perhaps you will supplement your evidence by looking at those figures again?—Yes, I will.

Low prices.

21,071. To what other cause besides foreign competition do you attribute the prevailing low prices?—I think the present low prices are the result of progress. The land in England is extremely limited in quantity, while the population is on the increase; that would tend to make prices higher, were it not that the locomotive power of steam has practically brought millions of acres of other land close to us. That has destroyed the land monopoly so far as the price of produce is concerned. The new land that is brought to us is to my mind as good as our own, possibly better. The natural result of that is that although English land and its produce are decreasing in value and must continue to decrease, the earth's surface is getting almost into one piece, and the value of land in one place affects its value in others. It seems to me that English land is going down in price, that American land is rising in price, and that the two are tending to a state of equilibrium, and that that state of equilibrium will be the value of American land plus the cost of bringing its produce to the centre of population. English land is going down to that and American land is rising to it. That appears to me to be the cause of the depression.

Cost of wheat growing in Kansas.

21,072. And you see no immediate prospect of any rise in prices?—No, I do not. It seems to me from evidence that I have from other parts of America that there is no possibility of an increase of price. I have letters from a gentleman in the State of Kansas, for instance. He says that it pays him to grow wheat at 2 dollars 24 cents per quarter—that is 9*s*. 4*d*. per quarter; and he says also that he can grow wheat and get another crop off the same land

in the year. Take it at 10*s.* per quarter; then we could get it into Liverpool at 11*s.* 4*d.*, because it costs 1*s.* 4*d.* per quarter to bring it across.

21,073. Are you speaking of wheat?—Yes.

21,074. (*Mr. Giffen.*) How far is Kansas from the seaboard?—That is some distance from the seaboard.

21,075. (*Mr. Lambert.*) What did you say it cost him?—2 dollars 24 cents; and it could be got into Liverpool at 11*s.* 4*d.* per quarter—so he says. As the railways of America are developed, so the cost of bringing the produce to the sea-shore will decrease. At the present time at Florida wheat is very much dearer than it is in the interior of America; but as the railways are developed so the prices will tend to equality, and after a time we shall get wheat from Florida at little more than the Kansas price.

Depression amongst American farmers.

21,076. (*Viscount Cobham.*) Have you not heard of the existence of great depression amongst the American wheat growers?—It is denied most emphatically by the Department of Agriculture of America. I sent over to them a cutting from a newspaper in which the farmers of Dakota and Minnesota were said to be making a stampede from the country on account of the low prices. They deny that that is the cause of the stampede. They say the cause of the stampede is that the farmers all suffer from want of railway communication to carry their produce to the centre of population, and that the farmers are leaving for the sake of taking up new land which is now being opened up in Florida. I have a map of it here. Three thousand square miles are now for sale in Florida, and the farmers from Dakota and Minnesota are going to get it. They like a more genial climate.

Wheat growing in Florida.

21,077. (*Mr. Whitehead.*) Is that a wheat-growing climate?—Yes; they can grow a crop of wheat in Florida, I am told in one of the letters, and another crop of another kind afterwards in the same year.

21,078. (*Viscount Cobham.*) Is it owing to that quality of the soil that they are able to make a profit even out of 9*s.* 4*d.* per quarter?—Yes.

21,079. (*Mr. Giffen.*) What extent of acreage is there in Florida available for wheat growing?—I do not know, but I can tell you how much is now cultivated.

21,080. (*Mr. Whitehead.*) As wheat land do you mean?—Yes, as wheat land. I do not think I have the information for Florida here.

21,081. Florida is surely below the wheat-growing line—it must be I think?—I have the information for the next State to it—Georgia.

21,082. The climate would not suit wheat-growing in Florida, I believe?—Here is an account of the Florida land illustrated.

Reductions in rent.

21,083. (*Viscount Cobham.*) To revert to what you said before, you are of the opinion that the owners in Leicestershire have not recognised the decreasing value of land to a sufficient extent, and that rents should be further reduced; what evidence have you to give as to the further reduction of rent which in your opinion is necessary?—My evidence is nothing more than this:—The Leicestershire tenant farmers think that if their rents were reduced in proportion to the decrease in the selling value of land they would be quite satisfied and would be fairly well off. At present I do not think there are 20 farmers in Leicestershire who are fairly well off.

21,084. The selling value has decreased about 50 per cent.?—Yes.

21,085. And that decrease in the rents you think would meet the position, but in this statement of yours you go a good deal beyond that, I think you show, or at all events many of your informants try to show that if no rent at all was paid still there would be a loss on farming?—Some of them say so, and there is no doubt that it would be so, but I think a good deal of that would be due to bad farming. I have only put their opinions, not my own, on that paper. In collecting those statistics I put away all my own opinions altogether.

21,086. The "General Notes on the Summary" I thought embodied your opinion?—No, that is an abstract of the opinions of others.

21,087. Do you think your informants have given sufficient weight to the reduction of expenses in many directions which have been possible in late years, such as the increased cheapness of feeding stuffs and manures?—I think those things are all cheaper than they were a few years ago. The farmers generally say that if a reduction of rent of 30 per cent. were made they could carry on very well and they would be satisfied.

21,088. Thirty per cent. on the present rent?—Yes.

21,089. Have you anything to say as to the present system of rating?—I think the present system of rating tenant farmers is altogether an unfair one.

Rates

21,090. In what respects?—The rents of land have not fallen in proportion to the selling value of the land, and the tenant has to pay rates upon the rent, that is upon the former value of the land, not the present value. That is one objection. Then I think the payment of rates by tenants is particularly objectionable, because it is a tax on circulating capital. I object to rates on land being charged to tenants on that ground.

21,091. Would you put the payment of the rates upon the landowners?—Yes, I think that so far as the rates upon land are just, the owner ought to pay them, especially as they are for permanent improvements.

21,092. Of course if the landowners pay the rates they would have the administration of the rates?—That is not always the policy in this country, I think. In my own parish I think the persons who will pay the rates when the new Parish Council Bill comes into operation will not have the power in the Council.

21,093. Do you see no objection to that in theory?—I see a great objection to it in theory, but I fear my policy will never be arrived at.

Rural depopulation.

21,094. What has the effect of the depression been upon the agricultural labourers—upon their number to begin with?—The number of agricultural labourers has greatly decreased in Leicestershire. That is owing to a number of causes, first of all, to the increase in the pasturage—for less labour I think is required upon pastureland than upon any other.

21,095. Would that be the main cause?—That is one of the main causes.

21,096. Have you got the figures of the diminution of the labouring population?—No, I have not. Then I think the diminution of the wages fund by excessive rents and rates is the cause of many agricultural labourers going away. The farmers cannot afford to pay them wages, as the wages fund is practically destroyed by excessive rents and rates.

Labourers' houses.

21,097. Then the standard of cultivation must have fallen?—Yes, it must necessarily. Then again the deficiency of capital which has been proved by these statistics is also part of the causes of the agricultural labourer going away. Then there are the attractions of towns. There are better paid occupations there than in the country. There are many advantages in town life. Above all things I think there is this cause, a want in the country of better dwellings. It is really painful to me to see the houses in which some people are obliged to live. If there were other houses for them to go into, I would have many of the families turned out of the houses they are in now. Neither landowners nor tenant farmers appear to me to take any interest whatever in the agricultural labourers. They give them any kind of houses to live in.

21,098. In whose hands are these houses, do they belong to the landowners?—Yes.

21,099. Are they let to the tenant farmers?—They are let direct to the agricultural labourers by the owner of the land in most cases.

21,100. Would you say that is the case generally throughout the county?—I do not say that is the case generally throughout the county; I am only speaking of my own parish now. But throughout the county I think there is great reason to complain of the way that agricultural labourers are treated with regard to their dwellings.

21,101. Has there not been an improvement in that respect of late years?—I have not seen much of it. The other day a member of Parliament said to me, "I know a "case not far from where I live where a man is obliged to "move his bed away to get away from the wet which comes "through the roof." I can find houses where a man could not do that, he could not move his bed so as to escape the rain coming through upon him.

21,102. Do you say that the houses are so bad as to actually drive the agricultural population into the towns?—I have no doubt whatever that that is one of the causes which has led to the agricultural population going into the towns.

21,103. Do they get better houses in the towns?—Certainly.

21,104. At what rents?—I do not think rents are very much higher in the towns than in the country. I can

Rev. A. L. Sparkes, M.A., B.Sc.
25 May 1894.

picture to myself a house for which I know 2*s.* is paid, and I am sure that if that house were in a town—if it were on the outskirts of the town or in a court—it would be let for 3*s.*

21,105. Is there insufficient accommodation as a rule in these cottages that you are speaking of?—In some cases the accommodation is very bad. I know a case in my parish where a man and his wife and six children are living in two rooms, one upstairs and one down.

21,106. You are speaking more particularly of your own immediate neighbourhood now?—Yes, in that instance.

21,107–10. You do not wish to convey the same impression as to the rest of the county?—I think, myself, from what I have seen in other parts of the county that there requires to be a very great reform in respect to labourers' houses. I think that the Parish Councils Act has failed in one point. I think that Act ought to have provided for the acquisition of land for the purpose of building houses in parishes as well as for allotments. It is very difficult indeed for a working man to get a piece of land in Leicestershire to build a house on; if he has the money to build it he cannot get the land in many places.

Local Government Act, 1894.

21,111. But the main causes of the diminution in the number of agricultural labourers I gather are connected with the depression of agriculture?—Yes.

21,112. And you will not improve the numbers of the labourers or their position until the position of agriculture itself is improved?—That is so.

Condition of the labourers.

21,113. How about the condition of the labourers?—I think their condition is not what it ought to be in this age and in this country.

21,114. Apart from their houses, are their wages well maintained?—Their wages are better than they were 10 years ago no doubt, but I do not think they are what they ought to be now by a very long way.

21,115. The commodities they buy have greatly fallen in cost, have they not?—Yes.

21,116. Therefore, they are better off in that respect?—There would have been a great many more labourers in the towns than there are if it had not been for the allotments. The allotments have kept a great many in the villages.

21,117. Comparatively speaking would you say that the condition of the labourers in Leicestershire has improved within your recollection?—Possibly, but not very greatly.

Allotments.

21,118. Is there a good supply of allotments?—Yes. I find where there are allotments within a reasonable distance, and the rent is reasonable there is no difficulty in letting them.

21,119. Is there a considerable demand for them?—Yes, a very great demand. In my parish there are allotments, but they are of no use, no one will take them for both those reasons, they are too far away from the population and the rents are too high.

21,120. Under favourable conditions would you say that the cultivators do pretty well?—Yes, I think they do.

21,121. Are you speaking now of agricultural labourers exclusively, or of townsmen of all classes?—I speak of those workmen who live in the country, colliers as well as agriculturists.

Agricultural education.

21,122. How is the Technical Instruction Grant administered in your county?—In most places where efforts have been made by the County Council and the Leicestershire Agricultural Society to try to succeed in the teaching of technical science, I am sorry to say the farmers especially do not appreciate it as they ought to do. I say that with very great regret as there is no subject in which I have taken so much interest as the technical education cause. Lectures on butter-making and cheese-making have been given by a very able man indeed, many of them being well attended. Some of those who go make fun of it, and I think I may venture to say that scarcely any go away, and put the principles that are taught into actual operation. Every farmer's wife has a rule of thumb method of making butter, and she thinks that her rule of thumb method is better than anybody else's rule of thumb method. The result of that is that if you see a dozen samples of butter in a shop, you will find they are all of different flavour or different quality; while if you see the same quantity of Danish butter coming from different places it will all be of the same quality.

21,123. Cannot they see that for themselves?—It is very difficult to make them see it.

21,124–5. They must see it in the difference of price that they receive in the market?—The farmers are prejudiced against anything that is new. The great difficulty I have always had with farmers is to overcome their prejudices.

Rev. A. L. Sparkes, M.A., B.Sc.
25 May 1894.

21,126. Do they derive no benefit from the lectures?—As a rule the farmers look upon these things with something like contempt; that is my impression, and I say it with great regret. I heard of a man the other day selling silicated phosphate of lime. The big name of "silicated" phosphate pleased the minds of some farmers greatly, although silicated phosphate of lime is a phosphate that will add sand to the ground, as far as I understand it.

21,127. Have you any suggestions to make for the improvement of this system of technical education?—My suggestion would be considered a hard one. I should like to see the Education Act altered and education in evening schools made compulsory, until boys and girls are 17 years of age I should make them go to school three nights a week. I think technical education would then have a chance of success, but I am afraid there is no chance and no hope for the present generation of farmers.

21,128. The money in fact is thrown away?—I think so. It is very difficult to get a farmer out of his old groove.

Land tenure.

21,129. What have you to say as to the present system of land tenure?—In Leicestershire we have what is called the custom of the county, and the farmers prefer that to the Agricultural Holdings Act. I think the custom of the county may be summed up by these words—this is the form which is given to me always—"As a farm is taken, "so it must be left." That is the Leicestershire custom of the county.

Custom of the county.

21,130. Do the tenant farmers prefer the custom to the Act?—Yes.

21,131. Why?—They say that the Act is so difficult to understand and so complicated, that the time for notice is too long, and that it is not sufficiently favourable to the sitting tenant.

21,132. So they prefer the custom of the county as being more favourable to them?—Yes.

21,133. Can you give any specific recommendations for improving the Act?—No, none, except what I have put upon those statistics. Fixity of tenure is the great thing they cry out about. I find that land courts do not appear to be at all popular in Leicestershire; men seem to prefer, even at a loss, to be perfectly free to bargain for themselves.

Land courts.

Fixity of tenure.

21,134–5. What do they mean by fixity of tenure?—They have the same idea of fixity of tenure as that which is found in a Bill which was brought in by Mr. William Smith. They think there should be a title to the tenancy of a farmer, and that when a man dies his widow should be able to sell his tenancy, or that if a man wishes to leave the farm he may sell the tenancy to the highest bidder. The argument in favour of it is this: that the condition of the farm is what the tenant has made it, and therefore it ought to be the tenant's property. In that way the competition for farms would be for the benefit of the tenant rather than of the owner. That is the view which the Leicestershire farmers take of it. In regard to land tenure I have some interesting manuscript statistics from the United States, which I do not think have yet been placed before you. On all the farms in the United States taking them at 100, there are 71·63 cultivated by their owners, 18·40 cultivated without the payment of rent in money but by a certain share of the produce, and 9·97 rented for a fixed money value the same as in England.

United States statistics.

Taxation in the United States.

21,136. Is that an official statement?—It is an official statement. It came from the Department of Agriculture in the United States, and it is dated 1890. I have made a calculation for some of the States as well as a general one for the country. Then, again, I have another important paper of the same kind respecting taxation. The assessment valuation in America appears to be made on the same plan as in England. I wrote to ask the question whether the assessment was a tenant's tax, and the reply was that the cultivator of the land, whether tenant or owner, always paid the assessment valuation. I find that that assessment was 1·85 per cent. in 1890, which is about 3½*d.* in the £. That appears to me to cover the tenant's rates.

21,137. (*Mr. Giffen.*) That is on the capital value, is it not?—On the assessed valuation.

21,138. That is on the capital value?—Yes.

21,139. (*Mr. Everett.*) Here it is on the annual value, which is a very different thing?—Yes; that would make a difference in the amount, of course. Then, I believe, that very great benefit would be derived by Leicestershire tenants from the system of agricultural banks which have been suggested.

Agricultural banks.

Rev. A. L. Sparkes, M.A., B.Sc.

25 May 1894.

21,140. (*Viscount Cobham.*) How would you describe it?—The one I have read about most is the one that was brought out by the Agricultural Banks' Association in London.

21,141. Would you tell us what it is?—I cannot give you all the details of it.

21,142. (*Mr. Lambert.*) It is a kind of co-operation credit, is it not?—It is.

21,143. You think such a system if properly carried out would be of advantage to the tenant?—Yes. It is certainly very valuable in the Argentine Republic; I have heard of it there. Mr. Yerburgh is connected in some way with the one I have heard most of.

21,144. I think such banks sprang up first in Italy, Switzerland, and France?—Yes.

21,145. Would it probably be owing to the fact of the Argentine Republic being populated largely by Italians, that the people's banks have been brought into use there?—I think that is the case.

21,146. (*Sir Nigel Kingscote.*) You told us that the Leicestershire Farmers' Union consisted of 1,500 members, all tenant farmers; how long has that union been in existence?—A little over 12 months. It came into existence very suddenly on account of the railway rates.

21,147. Have you been a member of it all the time?—Yes, I have been secretary of it all the time.

21,148. Did you mainly get it up?—Yes.

21,149. I think you said you had been in your present parish two years?—A little over.

21,150. Your going there was the first time you had an opportunity of any practical work as regards farming?—Yes, it was.

21,151. Do you farm your own glebe land?—No, I let my own land.

21,152. What is the population of your village?—The population of my parish is about 1,000. It consists of three villages situate at the three angles of an equilateral triangle.

21,153. All in the same union?—Yes.

Condition of the labourer.

21,154. You have stated to us in the course of your evidence, that the agricultural labourer is very badly housed?—All over Leicestershire, I think, he is not housed so well as he ought to be.

21,155. You have also given a very decided opinion, that he is very badly off, especially in the last few years, taking him generally?—Yes, but his wages have increased notwithstanding—as I pointed out.

21,156. Then you are totally opposed to the view of the Assistant Commissioner on the Labour Commission, who was sent down into those parts. Speaking of the Melton district he says:—"One verdict prevails in all the districts "alike . . . . . namely, that taking all things into "consideration the agricultural labourers were never so "well off as they have been during the last few years, in "spite of the depression which has caused serious distress "to most of their employers, and to all but the most "wealthy or fortunately situated of the landlords." You disagree entirely with that, do you?—No, I do not disagree with that. I believe they are better off than they used to be, but that is due to the fact that there are fewer of them. Their wages are increased. I think that they are not as well off as they ought to be, and that the wages are not enough now.

Labourers' houses.

21,157. Taking the parts of Leicestershire you have mentioned—Hinckley, Bosworth, and all round there—where there is a good deal of coal industry, I conclude you will be able to tell us whether the miners are very much better housed than the agricultural labourers or not?—Many of the colliers live in the villages, and they have no better chance of getting good houses than the labourers have. I do think many of their houses are not what they ought to be in country villages.

21,158. Neither the miners' nor the agricultural labourers'?—No.

21,159. You gave us a very bad instance of what we should call overcrowding in a cottage in your parish; is there no sanitary authority to prevent such a thing? There is already an Act of Parliament which provides for that, is it never put into execution?—If those persons were turned out of that house, there would not be another house for them to go and live in. I should have had them turned out myself if there had been any possibility of getting another house for them.

21,160. I think you said, your experience being limited to the last two years, that rents were kept up during these last two years by tradesmen of the towns competing for the farms?—Yes, to some extent.

Rev. A. L. Sparkes, M.A., B.Sc.

25 May 1894.

Competition for farms.

21,161. Do you wish to say that is your experience?—Yes.

21,162. In spite of the bad times they like to put their money into what they think is a very bad trade, is that so?—Yes, they do not go to it for the purpose of making money—they have made money—they go because they like the pleasure of cultivating the land.

21,163. In fact to lose their money?—(*No answer.*)

21,164. May I ask when you were in South America?—I have been back three years now.

21,165. It was before you came to reside in Leicestershire then?—Yes, I was very nearly three years in South America.

21,166. And in Canada, when?—I have only been in South America.

Condition farmers in Leicestershire.

21,167. (*Mr. Whitehead.*) I think you told us that there were not more than 20 tenants in Leicestershire altogether who were practically solvent?—No, I said I did not think there were 20 in the whole county who were fairly well off, those were my words I think.

21,168. Were those your exact words?—Yes.

21,169. (*Mr. Lambert.*) Perhaps you will define what you mean by "fairly well off"?—I should consider that a man was fairly well off when he was getting a fair return for his labour and capital.

21,170. (*Mr. Whitehead.*) You told us at the same time that the depression was not so great in Leicestershire as in other counties?—It is not so great as in Essex.

21,171. Therefore the state of the tenants in those other counties must be very much worse?—I think in Essex, yes.

21,172. There would not be a solvent one there I take it?—I do not know enough to say that, but I know there are farms in Essex which are not supposed to be worth any rent at all.

Average rent.

21,173. What is the amount of the rent paid per acre in your district of Leicestershire?—I should say that it varies from 1*l.* to 2*l.* an acre in my parish.

21,174. Does that apply to Leicestershire generally do you know?—My knowledge is not sufficiently extensive to be able to answer that question.

21,175. I think you told us just now that you were perfectly acquainted with all Leicestershire agriculture?—I know the people, but I do not remember all their rents.

21,176. You could not say what the average rent would be?—No, I have land in my own parish which I could let for 2*l.* an acre very easily.

21,177. (*Viscount Cobham*). Grass land?—Yes.

Reduction in rent.

21,178. (*Mr. Whitehead.*) You said that there has been no reduction of rents in Leicestershire generally, I think?—No, I said that there were cases in Leicestershire where no reduction in rent had been made.

21,179. Would that be in many cases?—I know two or three instances.

21,180. Two or three only?—Yes.

21,181. You led me to understand that there were a great many cases where there had been no reduction?—Many owners have not reduced the rents of some farms at all.

Agricultural education.

21,182. Have you a travelling dairy in your county?—I believe there is one just established but I have not seen it yet.

21,183. Would you advocate that?—Yes, anything in the way of technical education.

21,184. Is there any Agricultural College?—Not in Leicestershire itself.

21,185. Are there any experimental farms?—No, but the County Council give scholarships and send students to Cambridge.

21,186. Under the new system instituted by Mr. Pell?—Yes.

21,187. Have you seen experimental stations in the United States?—No, I have never been in the United States.

21,188. Nor in Canada?—No, my journeys to America were limited to South America.

Rev. A. L. Sparkes, M.A., B.Sc.

25 May 1894.

21,189. You do not know their working at all?—No, not at all.

Milk factories.

21,190. Are there any factories for milk in Leicestershire?—No, I wish there were. I believe that is one way by which the depression can be greatly reduced amongst milk centres. I have myself made efforts to establish a factory as an experiment. I have had communications with Lord Belper, Lord Denbigh, Lord Ferrers, and some others with the object of getting the capital. But even if the capital were got, it is a very difficult thing to get the farmers to join in these things. I do not think that any butter and cheese factory will pay unless it fulfils certain conditions. I think that any butter and cheese factory would pay well in Leicestershire, first of all, if the milk were paid for as quickly and as regularly as it is paid for by the London dealers, secondly, if the whey or the separated milk was sent back to the persons who send the milk, and thirdly, if all the farmers who supplied milk were shareholders in the factory. Then I think it would pay.

21,191. That would be making it a co-operative concern in fact?—Yes.

21,192. That would ensure a uniform quality of butter?—Yes, it would.

21,193. Is that not the reason why the Danish butter is uniform in quality?—I think it is. I have read books on that subject, and I am of that opinion from what I have read.

21,194. It is not possible to get a uniform quality from different makers by hand?—I have heard it stated by farmers that it would in England be impossible to get a uniform quality of butter as they do in Denmark because the feeding is so different, it is said that cows are fed so differently in the various counties of England that a uniformity of quality and flavour could never be obtained in this country, while in Denmark cattle are all fed on the same plan. But I do not understand that subject myself.

21,195. But the factory system has a great deal to do with the uniformity of quality?—Yes, it would have a very great deal to do with it.

21,196. It would be impossible to get uniformity without some system of that kind?—Quite impossible.

21,197. However much the dairymaids were levelled up to the mark?—Yes.

21,198. That is your opinion, is it?—I quite think so.

Poultry-rearing.

21,199. Is there any poultry rearing in your district?—I have had that tried by one or two farmers; I persuaded them to try it. They say there are a certain number of fowls that can be kept upon a farm, but beyond that number it does not pay. One farmer in Leicestershire, at my suggestion, has planted fowlhouses in different parts of his farm, so as to give the hens an opportunity of running about in different places. That pays very well he thinks, but it has not been gone into yet in any great degree.

21,200. In your opinion would it pay to rear poultry?—I believe it would pay. If a part of the farm were fenced in for the purpose of rearing wild rabbits I believe that would pay also.

21,201. (*Viscount Cobham.*) On good land?—They would not want good land, I think the worse the land is, the better rabbits like it—so far as my experience goes.

Fruit-growing.

21,202. (*Mr. Whitehead.*) I think there is no fruit cultivation in your part of the world, is there?—A gentleman tried the experiment a few years ago, but it has not paid. Besides there is another disadvantage in it; if a farmer were to try it, it would be so long before he got any return for his money. I believe it would be several years before the trees would produce anything.

21,203. He must be helped by his landlord to plant the trees, and so on?—Yes.

Farming in Northumberland.

21,204 (*Mr. Clay.*) You made reference at the beginning of your evidence to Northumberland—how do you find the farming there?—I do not think farming is as good there as it is in Leicestershire; but my observations in Northumberland were limited to the area about the wall that goes across the country just above Newcastle-on-Tyne.

21,205. You were only upon the Roman wall then?—Yes, close up in that direction.

21,206. You would not see very much good farming that way, it goes over the Cheviot Hills?—I have never been over those hills.

21,207. Have you never been in the Vale of the Tweed?—I have never been in the Vale of the Tweed.

21,208. Therefore you do not know very much about the farming of Northumberland?—No.

Rev. A. L. Sparkes, M.A., B.Sc.

25 May 1894.

21,209. You know about farming in Leicestershire?—Yes.

Condition of farmers in Leicestershire.

21,210. You say the tenants there are very much depressed?—Yes.

21,211. There is want of capital?—Yes.

21,212. And want of energy?—There may possibly be something in that, but I find Leicestershire farmers an industrious class.

21,213. But you say the principal cause of the depression is high rents?—Yes.

Reductions in rent.

21,214. Have the landlords not met the times by giving reductions?—A good many reductions have been given, but what I hold is that the reductions are not sufficient.

21,215. And so if there had been a larger reduction given to the tenant farmer he might have been cultivating his farm and paying rent still?—He would be cultivating his farm and paying a smaller rent than he is now.

Law of distress.

21,216. I think you said regarding that important question of the law of distraint in England that the law is unjust to the general trader?—I think so. It is very injurious to the prosperity of the farmer too, because whatever position a man may be in his credit must, so far as I am able to understand, be a fixed sum. I believe even the credit of our Queen herself is a fixed sum; it is so with every farmer in any case: there is a certain amount beyond which a farmer's credit will not go. If the landlord monopolises a certain portion of that credit in the form of the law of distraint, it must damage the credit of the farmer with everybody else.

21,217. Thereby the tenant farmer not having so much credit owing to the landlord getting his right of distraint, he has to pay a higher price for articles?—Yes, probably so; and a farmer would have more liberty to move in the way of getting capital if it were not for that law of distraint.

21,218. Do you not think the law of distraint has created also a false competition in land?—Yes, I think so.

21,219. The fact of the matter is that it has put credit on the level of ready money?—Yes.

21,220. That is your opinion?—Yes.

21,221. Therefore it has deterred the tenant farmer from paying cash?—I think the landlord, instead of looking for the man who has the most capital for a large farm, will look at the man who offers the most rent, because the law of distraint gives the landlord power to seize if the man gets into his debt.

21,222. What the landlord sues for in bankruptcy is only the rent of his farm?—That is it.

21,223. I suppose you would consider the rent of his farm as the interest on his money—his capital?—That is it; it is interest on his capital which involves no risk, and therefore he ought not to have any preference or any power over another creditor.

21,224. And a trader is both risking interest and principal?—Yes, I think so.

21,225. On that ground you would like to see that law abolished?—Yes, I should like to see the law abolished. I think it is a relic of feudal times which ought to be done away with.

Value of land.

21,226. Regarding the price of land in England, I think you said, perhaps justly, that the price of land in England must come to the value of land in America according to the produce plus the carriage?—Yes, I think so.

21,227. So—it is a melancholy thing for both landlord and tenant—we may look forward to a still further reduction in the price of land in England?—Certainly; I think there is no possibility of anything else.

Prices of dairy produce.

21,228–9. (*Mr. Giffen.*) Will you turn to page 8 of the statistics you have given us; I want to ask you one or two questions upon the figures that you have there. *See* Appendix. Looking at the column of prices for butter, I observe that in Melton, for instance, the loss on butter between 1883 and 1893 is 10·50, but in the Ashby district it goes as high as 20·83; can you account for the differences between district and district?—I am afraid it is rather difficult to account for that.

21,230. You can suggest no explanation of the differences?—Yes, Ashby district contains many small towns in which Danish butter is sold, and the producer suffers more from this competition than in the Melton district. Harboro' and Melton are much alike in regard to the fall in the price of butter; the others are much alike too.

21,231. Turning to the column of cheese, I find that the Ashby district which shows the highest loss on butter,

shows the smallest loss on cheese, namely 9·10 per cent.—how do you account for that?—I think that is partly due to this fact—that there is a very small amount of cheese made in Ashby; there is less cheese made in the Ashby-de-la-Zouche district than there is in any other part of Leicestershire.

21,232. Would that be so in Hinckley, where there is very nearly a similar loss to that in Ashby?—There is very little made in Hinckley either. On account of the small amount of cheese that is made in the Ashby and Hinckley districts, it would all be consumed by the persons who live in the neighbourhood, and consequently the prices would correspond with retail prices. That would make the loss less.

Price of wool.

21,233. If you take the column for wool, you will find that the loss on wool in two districts exceeds 40 per cent., but that in the district of Melton it is much less, namely, 26·80 per cent.?—That is due to the fact that the sheep are altogether of a different kind in those districts. There is some kind of wool which has fallen very much more than others, and that is the wool which is produced in the districts of Harboro' and Loughboro', that kind of wool has fallen more than any other.

21,234. In fact they are different districts?—Different districts and different kinds of sheep.

21,235. I think you are still of opinion strongly that there is no prospect of a rise in the prices of agricultural produce?—I do not think there is any prospect.

Prices of dairy produce.

21,236. Have you gone into it in detail with reference to every article of produce?—Chiefly with reference to corn and milk. I have not gone into it in regard to butter, and cheese.

21,237. Are not milk, butter, and cheese extremely important articles?—Yes.

21,238. And they may become more important?—Yes. There will certainly be a decrease in the price of cheese, because cheese is dearer now and has been for the last six months than it has been for a long time.

Price of meat.

21,239. Have you gone into it with reference to the prices of beef and mutton?—My impression is that the prices of beef and mutton will decrease too. Foreign mutton is growing greatly in favour in Leicestershire—speaking for myself I like it quite as well as the English—and a larger quantity will be sent over. There will thus be a less demand for the mutton and beef that the farmer raises and consequently a decrease in price.

21,240. Are not foreign mutton and foreign beef very much at bottom prices now, is it possible for them to be produced anywhere cheaper than they are now?—We do not find in Leicestershire that English mutton and beef are cheap. The farmer may get a small price for it, but the butcher must get a very large profit. We psy 10½*d.* a lb. now for beef steaks, and we think that a high price.

21,241. Then there would be a large margin in favour of the farmer if you could take away the profit of the butcher?—Yes. The farmer wants to sell his own produce direct to the consumer, then he would soon get right. But it is impossible to do that as far as I can see.

Virgin land in foreign countries.

21,242. With regard to the cereals, can you give us any calculation as to what the extent of the occupation of land in the new countries is likely to be—is it not probable that in a very few years most of the new land will be taken up?—I do not think so.

21,243. You have not gone into that question at all?—No, I have not.

21,244. Is it not the case that 25 years ago in the United States they passed a homestead law, enabling anybody to take up 160 acres of land upon cultivating it on certain terms, and that now there is absolutely no land to be taken up—it is all occupied?—Indeed! I have some information here on that subject. The Disston Land Company of Philadelphia have asked me in these letters to try to get English farmers to go out and take up their land, as they have plenty of land to dispose of at five dollars per acre.

21,245. That is at a price?—Yes, at a price.

21,246. But the land I speak of was obtainable without any price?—I do not think anything of that sort is done in America now.

21,247. Does that not point to a change which will very likely have a material influence upon agricultural prices all over the world?—Yes, possibly.

21,248. Although the world comes into competition with us, yet there is a monopoly of land, taking it all round?—Yes, and that may be the case until Africa comes into the market.

21,249. Is there any quantity of land in Africa to come into the market on competition allowing for the population in Africa?—I should say that the dark population of Africa will be driven out of its place and nearer to the equator, and that the best part of the land will be inhabited by white men before long.

21,250. You are not aware of the elaborate discussions on that question which have taken place?—No.

21,251. And you have not gone into that question?—No, I have not.

Fall in prices of farm produce.

21,252. Would you say that the prices of agricultural produce have fallen more on the average than general prices?—Yes, I think there is no doubt about that.

21,253. On the average, putting them altogether?—I think so. I think agricultural produce has decreased in price more than anything else.

21,254. But you cannot give us any particulars of it?—No, I have no particulars, but I have friends who are engaged in manufacture and importation, and I have asked the question of them, and I am quite satisfied that agricultural produce has decreased in price more than anything else.

21,255. What about the prices of beef, mutton, milk, butter, and cheese?—I include those with the rest as agricultural produce; I have taken them altogether.

21,256. Still you cannot give us any detail upon the subject?—No, I cannot. I dare say I could get details for you in a little time.

Condition of labourers.

21,257. You say that the labourers are not so well off as they ought to be?—I do.

Wages.

21,258. Upon what annual earnings of the labourer do you base that statement?—The average earnings of the labourers as they are given in the Labour Return are very much less than the average as I have given it in these statistics.

21,259. What figure do you make the average—I did not observe it?—I make the average as given by the farmers themselves to be 16*s.* 3½*d.* per week.

21,260. Is that the same thing as the average earnings?—That includes the value of the house, when they have one, at 2*s.* a week.

21,261. (*Mr. Little.*) You mean that the earnings, taking the whole year through, would be 16*s.* 3*d.* per week?—You will see a note on the manuscript table which distinctly says that that does not include extra labour for harvest.

21,262. Then it is wages?—Wages per week.

21,263. (*Viscount Cobham.*) A seven-day man would have more than 16*s.*, would he not?—The agricultural labourer has to work on Sunday always; he has some work to do then, I think.

21,264. (*Mr. Lambert.*) What work would he have to do on Sunday?—Milking and feeding cattle.

21,265. (*Mr. Giffen.*) So that the earnings are somewhat in excess of 16*s.* a week on the average?—Yes, for seven days' work.

21,266. Of course we would all say that it is desirable to see labourers better off than that; but compared with any past time is that not a very satisfactory state of things?—I do not think it is a satisfactory state of things for any man to have to live and keep a family on 16*s.* 3*d.* a week.

21,267. Still, families can be kept, and kept very well, in a civilised manner, even on that sum. Is that not possible?—Well, I do not think a man on that sum——

21,268. I am not advising that anybody ought to be content with wages of that kind, but I am putting it to you that as things go in this world, and have gone in past times, that is something which the labourer can make something of, but you do not agree with that?—I know many labourers who get 16*s.* and some who get more, and I have known them die when they have had four or five children and leave their children in the workhouse; they have had no possibility on 16*s.* or 17*s.* a week of making a provision for those children, which they would have done otherwise.

21,269. Are you quite sure of that?—Quite sure.

21,270. I know of cases of provision being made with a family on a much less income than that. You do not know of any; but I speak from experience; I am speaking of what I know?—Well, I am obliged to think it is not a satisfactory wage for a man to get; it is not a living wage according to my definition of one.

Rev. A. L. Sparkes, M.A., B.Sc.
25 May 1894.

21,271. I do not say that it is a desirable wage, but I am putting it to you that people have lived on wages like that, and done very well indeed?—Yes.

Condition of dairies.

21,272. (*Mr. Gilmour.*) At the commencement of your evidence you spoke of what you consider to be a very bad case of a tenant farmer who had a large dairy of cows, and who, in your opinion, was very badly treated by his landlord in regard to buildings especially I think?—Yes.

21,273. Has that man a lease so that he is tied down to remain on the farm?—No.

21,274. Then he could go at any time?—By giving the usual notice I believe.

21,275. Then I suppose he finds it to his advantage to remain?—You see he has sunk his capital in the land, and it would be very difficult to get it out again. That is the only reason why he does not go.

Reduction in rents.

21,276. I do not know whether I took you up aright, but I think you said that considering all the different districts, in the Melton division of Leicestershire, in your opinion the tenants have been better treated than in other parts?—Yes.

21,277. I see in your synopsis that the reduction of rent that was given there was the lowest?—Yes, but if you have the manuscript from which that synopsis was printed you will find that there is a note at the bottom of it to the effect that this only includes a radius of four miles from Leicester. The reduction of rent is smaller there, because that is all accommodation land.

21,278. As printed you would imagine that this was a proper division of the county of Leicester into divisions, and when you see 7·14 in one place and 30·32 in the other, and are told that Melton tenants are better treated than others, you can easily understand that the synopsis is misleading?—Yes.

21,279. I also notice that Melton is the highest rented land?—Yes.

21,280. Is there any explanation of that, because if so it would of course require to be added to the table. May I ask further in reference to this synopsis in what district you have included the other part of the country around Melton, which is without the radius?—That is not included at all. You will see on the preceding page "A "considerable part of the division is owned by the Duke "of Rutland, who, Mr. Sparkes says, is the best landlord "in the county, and Lord Dysart, and from these estates "it has been impossible to get returns." They would not give them, neither the tenants nor the owner.

Rates.

21,281. You spoke about rates, and you said that in your opinion you thought the landlord ought to pay the whole of the rates; that eventually would come upon the tenant, would it not?—Why? I do not see why it should. It comes on the tenant now.

21,282. Would it not be a much better plan for the landlord and the tenant to pay half and half?—Half and half would be a very nice arrangement; but it seems to me that a great many of the rates that are now charged upon the land ought not to be charged upon it at all. I fail to see what land has to do with the supporting of school boards, for example.

21,283. That is apart from the point I want to get at: I suppose you would admit that the probability is that if both the landlord and the tenant pay a share of the rates, whatever that share may be, the likelihood is that they will both take more interest in the necessary public work of the district than if one pays nothing at all?—That would probably be the case.

21,284. Then would you not think it would be a good plan to make it a general thing that rates should be shared between the landlord and the tenant?—Yes, but in any case I would make a tenant pay the rates on his own house; on the house but not on the land.

21,285. But you do not have your house valued separately from the land in England, do you?—It is done in my case.

21,286. (*Viscount Cobham.*) Separate from the glebe?—Yes. I think the tenant should be rated upon his house in any case. The house a man lives in seems to me to be a fair criterion of his ability to pay rates.

Condition of labourers.

21,287. Are the labourers in these districts employed by the farmer the whole year round?—Yes, I think that all agricultural labourers in Leicestershire are employed regularly. Regularity of employment is the great advantage of their work. They have a great advantage in that respect over any other men.

Rev. A. L. Sparkes, M.A., B.Sc.
25 May 1894.

Wages.

21,288. (*Mr. Little.*) I should like first of all to call your attention to page 6 in these notes. There you say, "Mr. Sparkes is informed that the average wages of the "labourer, as reported to the Labour Commission, is "several shillings per week lower than these returns show." May I ask if you have seen that part of Mr. Bear's report?—No, but a member of Parliament to whom I sent a copy of this said that the wages of the labourers in these returns were much too high.

21,289. You are probably aware that the report to the Labour Commission refers to one particular district only—to the Melton Mowbray Union, are you not?—I did not know that.

21,290. It only professes to give the wages and earnings of labourers in the Melton Mowbray Union. Mr. Bear states in his report (paragraph 29) on the Melton Mowbray Union, that the wages are higher in some parts of the county than in the Melton Mowbray district, and nowhere lower, unless it be for waggoners, stockmen, and shepherds in the south-western portion of the county. He collected some information from other parts of the county, and came to the conclusion that the Melton Mowbray figure was a low one for the county. We have had evidence to the same effect from Mr. Rolleston, of Leicester. When you collected information as to the wages of labourers did you distinguish between the different classes of labourers?—No, I put it exactly as the farmers gave it to me—so much for each labourer.

21,291. They would give you the wages for waggoners, stockmen, shepherds, and labourers, all included under one head?—Yes.

21,292. Perhaps I may tell you that Mr. Bear classifies the wages of the labourers under those different heads, and that he shows distinctly that waggoners and shepherds had more wages, and that day labourers had the lowest wages?—That is so.

21,293. I find that Mr. Bear gives the wages of the ordinary labourer in the Melton Mowbray Union as 15*s.* a week, and 13*s.* a week in some few parishes. Now I should like to refer you to your own figures, which give the wages in the Melton Mowbray Union as 14*s.* 11¾*d.*?—Yes; they could not be very much nearer.

21,294. If earnings are taken into account, Mr. Bear gives them as from 15*s.* to 17*s.* a week; would that agree with your experience?—No. I quite agree with all you have said; I think the labourers of the Melton division do receive the lowest wages of any of the county.

21,295. These wages, Mr. Bear states, are exclusive of any extra wages made in hay time and harvest?—Quite so, and so are mine.

21,296. (*Viscount Cobham.*) You stated that that was explained in a note to the synopsis, but there is not a note upon it, and, therefore, the note ought to be added?—I will add that. In regard to the Melton division I say, "Mr. Sparkes does not attach very much importance to "the statistics for this division except as regards the price "of labour."

21,297. (*Mr. Little.*) I find that you state the average wages of the labourer are 14*s.* 11¾*d.*, whilst Mr. Bear gives the general ordinary wage of labourers at 15*s.*?—Yes; they could not be very much nearer.

21,298. Then the paragraph on page 6 suggesting a misstatement on the part of the Assistant Commissioner is not borne out, and it falls to the ground as far as your information goes?—That note on page 6 only refers to the Harboro' division, and not to Melton at all.

21,299. The charge is stated there in these words: "The "average wages of the labourer, as reported to the Labour "Commission, is several shillings per week lower than "these returns show." If the statement to the Labour Commission is only as regards the Melton Mowbray division, and the statement as regards the Melton Mowbray division is true, the imputation against the Assistant Labour Commissioner is not sustained?—I make no imputation against anybody, but I made the statement with the object of showing that my own estimate of wages was even higher than others which had been accepted. The statement to which I referred about the Labour Commission was given to me under the impression that the Labour Commission had made a return for the Harboro' division of Leicestershire.

Agricultural statistics.

21,300. That is incorrect. Perhaps you will allow me now to refer to page 8. You must forgive me for asking you some questions about these statistics. May I ask whether they are solely based upon estimates or returns by farmers?—Entirely upon returns by farmers.

21,301. Then a farmer has stated what he made of his wool and what he made of his beef and his mutton, at one period and what he has made since?—Yes.

21,302. Do you think that the farmers who have made these returns have kept sufficiently accurate accounts to be able to base an estimate upon them?—The price at which they sell their things is the only thing that they record which is worth anything that I know of, they do put that down as a rule.

Sale by live-weight.

21,303. Do they sell their beef and their mutton by weight?—Yes, I think so.

21,304. By ascertained weight or by estimated weight?—I have known them to sell it by both. I have seen a farmer sell a bullock at so much a pound, which he would say would weigh so many pounds, and it has weighed within five pounds of what he has said.

21,305. Then you think they sell by live weight?—Yes.

Price of wool.

21,306. With regard to the price of wool, do you think there has been as much difference between the two classes of wool as is shown by this return?—Yes, I think so.

21,307. What sort of sheep do they keep in the Melton Mowbray Union?—They keep there what are called the Leicestershire sheep—the large sheep.

21,308. What do they keep in the Harboro' Union?—The same.

21,309. In Harboro' the decrease in value is said to be 40 per cent., and in Melton 26 per cent., how do you account for that?—I do not know what is the reason of that. Harboro' is a better place to sell wool for one thing It is Loughboro' and Harboro' where the Leicestershire sheep are to be found.

21,310. Are they not found in Melton?—I do not think so. That was the explanation which the farmers at the meeting gave of this.

21,311. Is not the best land in the Harboro' division?—Yes, undoubtedly.

21,312. And the finest quality of wool?—Probably.

21,313. Yet there is the greatest decrease in value there?—Yes.

21,314. These figures are simply based upon the farmers' returns of the prices that they have made?—Yes.

Relation between rent and value of produce.

21,315. Then on page 9 I think you have summed up your views. At the end of the last paragraph you say: "This appears to Mr. Sparkes to be the right view to take "on the relation between rents and produce." You have taken the reduction on wool, beef, and mutton, and have arrived at the conclusion that the average loss (by which I suppose you mean decrease) is 29·6 per cent.?—Yes.

21,316. You have taken those articles as being all of equal value; that is, of equal importance?—Yes, in one sense; but it would be impossible for me to get statistics in regard to quantity.

21,317. That is a false mathematical process, is it not?—I can see well enough there would be a great deal more value in beef and mutton than in wool.

21,318. Then you base on this false mathematical result a further calculation?—Yes, but it is true as an illustration, and it is only given for that purpose.

21,319. And you arrive at the conclusion that if rent were reduced by 103·6 per cent. the farmer would be just in the same position as he was before?—The rent would be a negative quantity of course then.

21,320. But the land is worth something now?—Yes.

21,321. Therefore if the present rent is reduced 103·6 per cent. upon the former value?—I quite understand what you are pointing to. I saw all that at the time. The real object of this is to show what would be the result of the three and-a-half times calculation referred to in the previous paragraph. It is simply illustrative.

21,322. I quite understand that, but by taking a reduction in the value of produce you do not arrive at once at the necessary reduction in the rent?—No, but it might be calculated on the plan I have illustrated.

21,323. It does not give it to you?—No, it varies between great extremes.

Depression in Leicestershire.

21,324. I think you admit that the depression in Leicestershire is considerably less than it is in some other parts of the country?—Yes.

21,325. Do you think that is chiefly due to the fact that 80 per cent. of the land in Leicestershire is either grass or clover?—Yes.

21,326. There is only a small proportion of corn?—A very small proportion.

21,327. Less than 15 per cent?—Yes.

21,328. Whatever fall there may have been in the price of meat, and wool, and butter, and cheese, it is not equal to the fall in the price of corn?—No.

Law of distress.

21,329. With regard to the question of distraint do you really think that a landlord would be so foolish as to run the risk of having to put in a distraint, and that he would take a tenant without capital on the chance of being able to sell him out at any time?—I have known cases where it has been done.

21,330. Where a landlord has knowingly taken a man who, owing to want of capital, was incompetent to conduct the business because he knew that he could distrain?—Well, it would be a very great argument in the minds of many landowners. Very many of them would feel, "Well, I shall be certain of the rent." The landlord wants to keep up the rent, because if he once lets it down he will never get it up again.

21,331. A man can only distrain about once, can he; when he has once distrained he has sucked the orange, and he must then find another tenant?—Yes, I should say so.

21,332. So there is no very great prospect of his succeeding by letting to such tenants, is there?—Landlords very often do very curious things of that kind. I know a case myself where a tenant has been on an estate for several years. He found that he was losing year by year. He said to the landlord: "If you take off so much of my "rent—30 per cent. I think it was—I should like to stay "on; but I cannot unless you do; or if you will not take "off the 30 per cent. will you put all the buildings in "order for me." The landlord declined to do either of those two things and the man left. When the next tenant came the landlord took off the 30 per cent. and put the buildings in order for him too; so of course that tenant was a successful man.

Competitio for small farms.

21,333. I think you said that if the law of distraint were abolished men would be led to take smaller farms?—Yes.

21,334. That would increase the competition for small farms, would it not?—Yes.

21,335. There is already a considerable demand for them I think you said?—Yes, in some parts.

21,336. Then that would probably increase the rent of the small farms?—No; you would have to make small farms out of some of the large ones then.

21,337. I thought you said that the rent of large farms would be diminished and that the demand for small farms would be increased; it seems natural to suppose that the rent of large farms would in such a case diminish, and that the rent of small farms would increase?—It would pay to cut up many of the large farms into smaller ones in that case.

Sale of tenant's goodwill.

21,338. With regard to the sale of the tenant's goodwill, in what better position would the incoming tenant be if he had purchased the goodwill than he would be in at a full rent under the landlord—he would have to expend money in purchasing the goodwill, that is, capital for which he would want interest?—Yes, but he pays the landlord in rent for the goodwill now.

21,339. And which he might lose?—Yes, which he might; in that case, if he lost, the selling price of the tenancy would decrease, and he or his representatives would not get as much for it as they gave.

21,340. Therefore, the man who came in would be standing at a higher rent?—I do not see why.

21,341. Suppose land is let at 1*l.* an acre and it has the good-will attached to it and a tenant buys the good-will; he borrows the money to pay for the goodwill; he has to pay interest on that, and his rent and his interest stand him in 25*s.*; now suppose the value of land decreases, as it has done, and he wants to sell this goodwill; the rent is 1*l.*, the land is not worth 1*l.*, and he has nothing to sell—he has lost all that capital. Would that not be the case?—There would be a certain element of risk in it, the same as there is in everything else. If the land remained constant in value and the tenant increased the value of that farm by his own good farming, then the goodwill of the next purchaser would be greater necessarily.

21,342. Now suppose the man only kept it in the same condition and the land increased in value by the rise of prices, would you say that he was entitled to that increase?—No; well, I think that ought to belong to——

21,343. That ought to belong to whom?—I think if the value of the land had increased——

Rev. A. L. Sparkes, M.A., B.Sc.

25 May 1894.

21,344. Apart from the tenants labour?—Apart from the good cultivation of the land, it ought to belong to the owner most decidedly.

21,345. How would you ascertain that?—It is a difficult thing to ascertain; I do not know how you are to ascertain that.

21,346. Would not the landlord who had let his land at a moderate rent be placed at a disadvantage as compared with the landlord who had let his land at a full rent?—I do not think so. I do not see why he should.

21,347. Would a man who paid a full rent have any goodwill to sell; would anyone desire the occupation at any increased price; supposing it is let at 25*s.* an acre and no one will give more than 25*s.* an acre, would anyone give the tenant anything to come into that farm?—No, the landlord would be then taking advantage, as he does now, of the good cultivation of the farm.

21,348. But suppose the tenant is under an agreement to cultivate the land properly and well, and he has done no more, and the tenant has the farm at 1*l.* an acre, and someone is willing to give 25*s.* an acre, and the tenant is allowed to sell; the good landlord, who has let at 1*l.*, is at a disadvantage as compared with the other landlord who has let at 25*s.*?—Yes, he would be at a little disadvantage.

21,349. The only thing that the tenant has to sell is the margin between the competition value and the rent?—Yes, that is all.

21,350. Then the man who exacts the full rent leaves the tenant nothing to sell, and the man who lets at a moderate rent leaves the tenant a property to sell?—Yes.

Labourers' houses.

21,351. And that is a disadvantage to the good landlord. You spoke of the state of the cottages in Leicestershire. To whom do these bad cottages belong? I will not say to what persons, but to what class of persons?—Large landowners in some cases.

21,352. But is that generally the case?—It is generally the case that there are either a number of bad cottages or else there are what are called model cottages, which are built under one of two fallacies—either that plenty of light is not a good thing for a working man's family, or else that stones and bricks are more transparent than glass—for there are generally more stones and bricks about the model cottages which I have seen than glass where windows ought to be.

21,353. Would you say that the cottages on the landowners' estates compare favourably or unfavourably with the cottages provided by private persons?—Unfavourably.

21,354. On large estates?—Yes.

21,355. Is that your experience?—Yes.

21,356. And you are speaking from considerable knowledge?—Yes. I can take you to houses which are a standing disgrace to the age, but which belong to a large owner.

21,357. You say that much better cottages are required. How do you think they can be supplied?—I should suggest that powers should be added to the Local Government Act of the present year for acquiring land for building houses, on the same condition that the Act now enables land to be acquired for allotments.

21,358. Would that be with the object of the labourers' building cottages for themselves?—Yes.

21,359. Do you think they would be in a position to do so?—If they had the land I think they would be able to do it through building societies. Any building society will build a man a house in the towns if he has the land free of debt.

21,360. Would you suggest that the land should be given, that it should be provided for these people free of any charge?—No, certainly not. They should pay for it certainly before they begin to build.

21,361. Do you suggest that the labourer should pay for the land?—Certainly.

21,362. Do you think he would be in a position to do so?—Yes; there are many colliers and tradesmen who would be able to do so.

21,363. Are you acquainted with cottages that have been built by labourers—such cottages as squatters' cottages?—Yes, many.

21,364. Are they generally such as you would desire to see built?—Certainly, because the Building Societies will not lend the money for them unless they are.

21,365. I think that is not the class of houses I was speaking of—I mean squatters' cottages?—I have always found them to be well built in that case—they are far better cottages than the landowners build for the poor persons who live on their estates.

Rev. A. L. Sparkes, M.A., B.Sc.

25 May 1894.

Leicestershire Farmers' Union.

21,366. (*Mr. Lambert.*) You say that 1,500 members, all of them tenant farmers, belong to your Union?—Yes.

21,367. That was started about two years ago?—Yes.

21,368. It sprung from the difficulty owing to the railway rates?—Yes.

21,369. Do you represent these 1,500 farmers in the views that you now lay before the Commission?—Yes, I am one of the persons that they have elected to give evidence.

21,370. What meeting did you hold to elect the representatives to give evidence? Was it a representative meeting of the 1,500 farmers?—We have five places of meeting in the Union, and about 300 members in each—at Nuneaton, Hinckley, Bosworth, Ashby-de-la-Zouch, Worthington, and Loughborough. It was agreed upon by a deputation from each of those districts.

21,371. I understand you have gone into this matter for about two years?—Very nearly—twelve months last January.

21,372. You entered into it free from all prejudice, and with an open mind upon the subject?—Quite, and I have tried to retain that state of mind all through the time until to-day, when I have come to express my own views as well as the views of others. Up to the present time I have never even expressed to a member of our Union whether I am in favour of Protection or not, because I wanted to get their views. To-day I am not only here to represent their views, but my own, too.

Reduction in rents.

21,373. You said just now that the depression as far as farmers were concerned, was due entirely to an insufficient reduction of rents?—Yes, I think so.

21,374. And that in order to put farmers upon their proper footing and to give them what you call a fair return for their capital and their labour, there should be a further reduction of 30 per cent. in the rents, in addition to the 25 per cent. already granted?—Yes.

21,375. Is there a competition for farms in your district?—Yes.

21,376. How are farms let?—A certain rent is put upon them, I believe, and when farmers inquire they are told what the rent is and what the conditions of tenure are. I do not know what the conditions are myself. The agent of a very large landowner told me some time ago that if he had a hundred farms he could let them all at once, but he had not a hundred then. On the 25th of March this year the first of his farms became vacant, and he has been seeking for a tenant ever since without success.

21,377. That would rather tend to show that rents will decrease or naturally go down?—I should say that they naturally will go down, because I do not think that farmers have the capital to pay rent much longer at the rate it is now.

Payment of rent out of capital.

21,378. Can you state this as a fact from your own personal knowledge of farmers: that tenant farmers are now paying rent out of capital, and have been doing so for the last four years?—They all say so; every one that I know does.

21,379. You have no reason to disbelieve that?—Not the slightest; I do believe it. I think these returns I refer to of the Board of Trade ought to prove it.

Fixity of tenure.

21,380. As regards the tenure of land, the tenants complain of a want of fixity of tenure, I understand?—Yes.

21,381. Does that mean that when a man enters upon a piece of land he shall have a permanent holding in the land?—I suppose it does. They understand by fixity of tenure what is stated in the Bill brought in by Mr. William Smith and Mr. Channing, I think, and Mr. Price.

21,382. Have you read that Bill?—Yes, some time ago.

21,383. Probably you would think that is a very drastic Bill; that it proposes, I might almost say, a revolution of our present system of letting land?—It involves a very great change indeed.

21,384. Do you think the farmers in your district would go as far as that Bill goes?—Yes, in regard to fixity of tenure, but not in regard to other parts of it.

21,385. What other parts?—They are not in favour of land courts, for instance.

Compensation for improvements.

21,386. Presuming that the farmers had compensation for all the improvements they made upon their holdings, would that be a sufficient fixity of tenure for them?—It

Rev. A. L. Sparkes, M.A., B.Sc.
25 May 1894.

would all depend upon the way in which that compensation was made. They are all dissatisfied now, because under the Agricultural Holdings Act the compensation is settled by two land agents. They object to that; they think that a tenant farmer ought to be one of the valuers, at least.

21,387. But may not a tenant farmer appoint a brother tenant farmer as a valuer in his behalf?—I do not know, I am sure; I do not know anything of the Agricultural Holdings Act. It is not the general impression that such is the case.

Compensation for disturbance.

21,388. Presuming that a landlord wishes factiously to get rid of a tenant, to evict a tenant, would the farmers in your district be in favour of compensation for disturbance; would that meet their views?—That would probably meet their views.

21,389. It would?—I think so.

Rates.

21,390. You have given us some information about rates. As I understand, you think the rates ought to be borne not by the occupier, but by the owner?—Except the rate on the house; that, I think, the tenant ought to pay.

21,391. Have you any ideas of your own as to the incidence of rates, whether, for instance, the land is too highly burdened with rates?—I certainly think it is too highly burdened; there are many rates, I think, which ought not to be upon land at all. In my parish the roads are very much worn by coal carts, carriers' carts, railway carts, bicycles and tricycles, none of which pay any tax or rates at all.

Ground game.

21,392. Is there any feeling as regards the working of the Game Laws in your district?—No, I think we are tolerably satisfied about that. The ground game has pretty nearly all gone. We have shot that all away.

21,393. So there is no complaint at all?—None whatever.

Railway rates.

21,394. You have read something about railway rates, have you any instances where railway rates are excessive?—Yes, railway rates are very excessive indeed between Worthington and Ashby. If I were to send one hundredweight by passenger train it would cost me about 6*d.* or 8*d.* a mile, 8*d.* a mile in all probability.

21,395. These instances must be specific, and if you have any I should be glad to have them taken down, but do not give me any information which cannot be used as facts?—I can give you a few. It is 15 miles from my parish to Leicester, and it costs 3*s.* a ton to take coal from that place to Leicester, although it is sold at the pit's mouth readily for 7*s.* 6*d.* per ton. It costs, practically, more to carry the coal that 15 miles than the colliers receive for getting it; they do not receive 3*s.* a ton for getting it. It was alleged, and I believe it is true, that it costs more to take a ton of dead meat from Leicester to London than it does to bring foreign meat from Liverpool to London.

21,396. But you cannot give those as examples of your own knowledge?—Not that one; in the case of the coal I can, for I know that is true.

21,397. Are those the only instances of excessive rates that you have at present in your mind?—I do not think the rates for milk are at all excessive now.

Co-operation.

21,398. With regard to co-operation in selling, do you think you could make your association of any benefit to the farmers by allowing them to co-operate, or by offering inducements for them to co-operate, and sell their produce?—I wish I could, it is a thing I have long desired, but I am afraid the tenant farmers are not good men to bring into the practise of co-operation.

21,399. But you would think there would be a great advantage were such an association for buying and selling produce formed?—A very great advantage indeed.

21,400. Are there no such associations in your district?—None.

21,401. Is there no co-operative dairy factory there?—No, I wish there was.

Agricultural education.

21,402. Then you said that you find a great reluctance on the part of the farmers to partake of technical education?—Very great.

21,403. Have you formed any ideas as to the best method of bringing technical education to the farmers?—It is no use trying to bring technical education to the farmers of the present generation; the only possibility is to benefit the next generation by a compulsory clause in the Education Act, such as I have described.

21,404. Practically the effect of that would be that the present race of farmers must die out before you get any improvement in that respect?—It must be so. So far as the Leicestershire farmers are concerned I am sure that technical education will not do them any good, they will not attend to it.

Rev. A. L. Sparkes, M.A., B.Sc.
25 May 1894.

Condition of yeomen farmers.

21,405. (*Mr. Everett.*) Are there yeomen farmers in your country, that is farmers farming their own land?—There are a few but not many.

21,406. Do you know whether they have suffered in the depression equally with the tenant farmers?—One of the vice-presidents of our Union is a man who farms his own land, and he complains grievously of his losses.

21,407. They have not found fixity of tenure and the right of free sale to save them from the depression which has hit their neighbours?—No.

Condition of agricultural classes.

21,408. You spoke in regard to the labourers being sometimes overcrowded in their cottages; are you aware that there are hundreds and thousands of instances in our great towns where whole families live in one room instead of in a cottage?—Yes; there is some explanation for it in a large town, but there is none in the country, where the land is plentiful and cheap.

21,409. You spoke of the agricultural labourers not being so well off as they should be. I notice that you say also that the farmers are not so well off as they should be, and that the clergy are not so well off as they should be?—Nor are the owners.

21,410. Can you suggest any way in which the unhappy condition of all these classes, practically the whole agricultural population, can be amended?—It appears to me that the interests of the three classes of owners, tenants and labourers are so opposed to each other that what would benefit one could not possibly benefit either of the other two parties. That is the great difficulty that I see.

21,411. You do not see your way to remedying the condition which you deplore?—No, indeed not.

Character of cultivation abroad.

21,412. You have travelled a good deal, you have told us; how does the condition of the cultivators of the soil in other lands compare with the condition of the cultivators of the soil in England as far as you have seen?—Do you mean in South America or on the Continent?

21,413. I should like to have your opinion with regard to both places?—In South America the large cultivators of the soil are almost entirely Europeans. I include within the name Europeans even the Spaniards, who are born in South America. There are Europeans who have gone to the country within the last 30 or 40 years; they have got the land and they cultivate it. In my continental experience I have always come in contact with small holders who cultivate their land beautifully. Take the cultivation of Normandy, for instance; you can notice it even in passing through in the train from Dieppe, as you go to Geneva; you may look for miles from the train and you will not see a loose stone in the fields.

21,414. How about weeds?—I think the land has been more free from weeds than English land has, so far as I have seen it.

21,415. I remember taking a journey through France once, and I think I saw infinitely more weeds growing in the fields there than I was accustomed to see in Suffolk?—Probably you went from Calais to Paris.

21,416. Yes?—The land is quite different there from what it is in other parts.

21,417. (*Mr. Little.*) Do you know Normandy besides passing through it by rail?—Rouen is on the borders of Normandy is it not?

21,418. Yes?—I have been there.

21,419. Have you examined the agriculture there, have you travelled about the country there?—Yes, I have been all round Rouen; I was there for several weeks.

Agriculturists in South America.

21,420. (*Mr. Everett.*) In South America now is not the bulk of the land tilled by small people who do their own work?—No; the small people to whom you refer are those who live upon land which they pay nothing for. It does not belong to them. They go and pitch their tents like gipsies and then cultivate it. They stay there until they have got all out of the land that is worth anything and then they go to another place; they are nomadic.

21,421. Take the Argentine Republic for instance; is not that land generally tilled by Italians, each man tilling only what he and his family can deal with?—It is not the Italians who do that. I never saw an Italian who was ever settled on the Argentine land at all. The people who do that are called Guachos; they are half-bred between the Spaniards and the Indians, and have descended from

generation to generation from the mixture which occurred after the time of Pizarro.

21,422. How long is it since you were in the Argentine Republic?—I came back three years ago. There are many Italians, but all that I know are engaged either as workmen in making railways, or they are keeping cafés and stores.

21,423. That is a very different account to what was given to me by a gentleman who has written from there quite recently; but you speak of what you saw with your own eyes?—Yes.

Low prices.

21,424. In your printed notes you speak of low prices as being the result of progress?—Yes.

21,425. I understand you to contend that the tendency of things is as man's power over nature increases for prices to fall?—Certainly.

21,426. Are you aware of the fact that from the accession of Queen Elizabeth to the birth of Queen Victoria, a period of between two and three centuries, on the whole prices tended to rise instead of to fall?—Yes, but that was only apparent. Money was of such a different value then. Even labour was 2½*d.* a day in the days of Queen Elizabeth.

21,427. It was a real rise as regards money and when we speak of high and low prices, we are speaking of money prices, are we not, that is what we mean, we mean money prices?—Yes.

21,428. As a fact during all that long period—a period on the whole I presume of progress—instead of money prices falling as civilisation advanced they continually on the whole tended to rise?—Yes, but what were the discoveries of that long period from the decease of Queen Elizabeth to the accession of Queen Victoria in comparison with what they have been during the last 10 years all put together.

Prices, 1853-73.

21,429. Was not the period from 1853, say, to 1873, a period of quite as great a march in improvement as the last 20 years?—The last 20 years have seen the development of railways and steam power to a far greater degree than was seen in the previous 20 years. I can go now from Grantham to London without stopping, but I could not do that 20 years ago.

21,430. Would you not say that the development from 1853 to 1873 was greater than the development for instance from the beginning of the century to 1853—probably greater even than for a period of hundreds of years previously?—It may be, but then you see there were so many things that tended to decrease prices which occurred about that time. There were the repeal of the Corn Laws for example just before, and the passing of the Reform Act in 1832. All these things must necessarily have had an effect upon prices.

21,431. Has not your attention been called to the fact that from 1853 to 1873 the average prices tended to rise instead of to fall?—Yes.

21,432. That was a period of very great industrial activity and progress, was it not?—Yes, but it did not bring the world all into one place as it were, as our progress has done since. I have sent a telegraphic message round the world myself—sent it one way and back another—and have received a reply to it in two hours and 30 minutes. That is a thing which was quite unknown even 20 years ago.

Protection.

21,433. Was there anything you wished to say in regard to your own or your neighbours' opinion on the subject of Protection?—I do not believe in Protection in any form. I do not see that it can be any good to anyone. Besides if my theory is true that the low prices have been produced by the progress of the world, I should not like to shut all except agriculturists out from the benefit of that progress.

Agricultural statistics.

21,434. (*Mr. Little.*) I think you have compared the number of live stock at two different periods—one I think four years ago?—Yes.

Rev. A. L. Sparkes, M.A., B.Sc.
25 May 1894.

21,435. I have taken out the figures for 1883, 1888, and 1893, taking in 1888 an intermediate period in the 10 years?—But that does not include the year that I refer to.

21,436. Was there a special reason for selecting that year?—No, it was a matter of accident purely.

21,437. The facts disclosed by that comparison would be altered by comparison with another year, as we shall see if you will take the official returns, and see whether these figures that I am going to put to you are right. Take, first, horses. Do you find that in Leicestershire in 1883 there were 18,018 horses?—Yes.

21,438. In 1888, 18,112 horses?—Yes.

21,439. And in 1893, 19,080 horses?—Yes.

21,440. Now take cattle. In 1883 there were in Leicestershire 134,755, were there not?—Yes.

21,441. And in 1888, 134,901?—Yes.

21,442. And 139,199 in 1893?—Yes.

21,443. Now sheep. Were there not 277,280 in 1883?—Yes.

21,444. And 319,722 in 1888?—Yes.

21,445. And 342,514 in 1893?—Yes.

21,446. Now will you look at the permanent pasture. You will see that the figures for 1883 are 321,911, are they not?—Yes.

21,447. For 1888, 340,298?—Yes.

21,448. And for 1893, 350,359?—Yes.

21,449. Perhaps you will just look at the cattle in detail. The cows in 1883 were 36,670, were they not?—Yes.

21,450. And in 1888, 38,671?—Yes.

21,451. And in 1893, 40,358?—Yes.

21,452. Taking cattle over two years old. In 1883 they were 55,689, were they not?—Yes.

21,453. In 1888, 55,654?—Yes.

21,454. And in 1893, 52,584?—Yes.

21,455. Now take cattle under two years old. You will see that in 1883 they were 42,396; is that not so?—Yes.

21,456. And in 1888, 40,576?—Yes.

21,457. And in 1893, 46,257?—Yes.

21,458. Now take the sheep one year old and above; in 1883 they were 175,656, were they not?—Yes.

21,459. In 1888, 200,093?—Yes.

21,460. In 1893, 215,375?—Yes.

21,461. Sheep under one year old in 1883 were 101,624, were they not?—Yes.

21,462. In 1888, 119,629?—Yes.

21,463. And in 1893, 127,139?—Yes.

21,464. Those figures show an increase of nearly 11 per cent. in the horses in the 10 years from 1883 to 1893, do they not?—Yes.

21,465. An increase of 3·3 per cent. in cattle?—Yes.

21,466. And an increase of 23½ per cent. in sheep?—Yes.

21,467. The increase in permanent pasture being 8·8 per cent.?—Yes. But how are the last four years to be explained; that is very curious.

21,468. (*Mr. Lambert.*) Is it not the fact that cattle have gone down materially in price in the last four years?—Yes, very greatly in Leicestershire.

21,469. Judging from the figures there was an increase from 1883 up to 1890, but since 1890 to 1894 there has been a very considerable decrease in the price and also in the value of the cattle?—Yes.

21,470. Thus showing that in the last four years the value of the farmers' capital has very materially depreciated?—Yes.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Fortieth Day.

Thursday, 31st May 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
WALTER HUME LONG, Esq., M.P.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., FREEMAN THOMAS, Esq., *Assistant Secretaries.*

Prof. J. P. Sheldon.

31 May 1894.

Professor J. P. SHELDON called and examined.

21,471. (*Chairman.*) You are an owner of land, I think?—I am a yeoman farmer and landowner.

21,472. Do you farm yourself?—Yes, I do.

21,473. To what extent of land?—It is not extensive, something under 80 acres.

21,474. Where is it situated?—In north-east Staffordshire.

21,475. For some time you were a professor of agriculture at the Royal Agricultural College, were you not?—I was.

21,476. And also at the College of Agriculture?—Yes.

21,477. (*Mr. Whitehead.*) Is that the Downton College?—Yes.

21,478. (*Chairman.*) You were formerly a tenant farmer, I think?—Yes, I have been a tenant farmer for 10 or a dozen years, and unfortunately since then I have been a landowner.

21,479. Is all your own land in your own hands?—No, I have tenants.

21,480. You have considered the causes of agricultural depression?—We have all been compelled to consider those causes of late years.

21,481. You have come here to give your opinion as to those causes?—To the best of my ability.

21,482. Will you briefly state what your views are?—With regard to tenant farmers chiefly I presume you mean now?

Rents 1850-80.

21,483. Yes?—There are various causes for this depression; in the first place rents in many cases have been raised since about 1850 from 15 to 30 per cent. in my part of the country, They vary very much of course.

21,484. Between 1850 to 1879, I suppose?—Between 1850 to 1879 or 1880 say, the 30 years.

21,485. (*Mr. Channing.*) You are now speaking of Derbyshire and Staffordshire?—Of Derbyshire and Staffordshire.

21,486. How much were they raised on the average?—They were raised on the average about 20 per cent.

21,487. Can you say what the average per acre in that part of the country is?—I should think probably from 7*s.* to 10*s.* per acre.

21,488. Was that before the rise or what?—I think the rise was from 1850 to 1880.

21,489. That is the increase of rent, is it?—It is the increase of rent, and that would represent 15 to 30 per cent.

21,490. What was the average per acre? At the point when they were lightest did the rents average 30*s.* or 25*s.*?—15*s.*, or may be hardly that. There is a great parity in the quality of the land in that part of the country.

21,491. What is it for average land?—About 20*s.* per acre.

21,492. After 1880 in consequence of bad seasons and low prices did the rents go down?—There has been no general drop of rent; the almost universal custom, especially on the large estates, has been to make remissions. The remissions have varied from 5 up to 50 per cent. Sometimes the remissions have been made in cash, at other times in the form of manures, lime, bones, and one thing or another.

Rents after 1880.

21,493. Have there been any permanent reductions?—Remissions there have been, but no general reductions. At present the old rents remain in force to a great extent nominally.

21,494. For the old tenants?—For the old tenants, and for the new ones.

21,495. (*Chairman.*) What is the nature of the cultivation in that district?—To a great extent it is grass land.

Derbyshire and Staffordshire.

21,496. Is there not much arable?—There is less now than there used to be.

21,497. Have the rents been maintained in the case of arable land or not?—There are no arable farmers properly so called. The farm that has most in arable you would find probably three-fourths is grass in that part of the country.

21,498. To what sizes do the farms run?—They run from anything you like up to 600 or 700 acres.

Sizes of farms.

21,499. What do you mean by running from anything you like?—Small holdings.

21,500. What is the average; is there an average of 200 or 300 acres?—The average would not be so high as that; perhaps the average might be 100 to 150 acres; nearer 100 than 150. We have a number of small farms and not many large farms.

Small farms.

21,501. Do the tenants work themselves?—Mostly, they work while they are able.

21,502. What number of labourers would a farm of 150 acres have?—That is a difficult question to answer, because if he is a farmer his children stand in the place of labourers, and do the work. Every member of the family, as a rule, male or female, does his share of the work whatever it is, so long as he is able.

21,503. Would a farm of 150 acres take two to work it?—Yes, two men. Usually one man living in the house, a yearly servant, who boards and lodges in the house; and for a dairy farm of 150 acres there would probably be two men and a lad, and at least one woman servant and a girl.

21,504. Do they sell milk?—Whenever they are near enough to a railway they sell milk, especially in winter time when the demand is great. In the summer time they are unable to sell all their milk, and they make cheese or butter as the case may be,

Prof. J. P Sheldon.

31 May 1894.

The letting of farms.

21,505. When farms are vacant are there applicants for them?—I think I have never known quite so many farms vacant at one time as there were during the present spring, say from Christmas on; but I scarcely know a farm now in my part of the country that is unlet. A good many were let at the last moment, or a little after it, that is a little after the 25th of March.

21,506. Have they been let at the old rents or at what?—It is not always possible to learn what they have been let at; there is a great deal of secrecy as to the rents agreed upon to be paid and received. I have reason to believe that in some instances farms have been let nominally at the old rent, but with the understanding that the tenant would pay what rent he was able to pay.

21,507. Have you had any farms vacant yourself?—No.

21,508. Can you give any specific data with regard to any farm which you know has been let lately?—With reference to the drop of rent, do you mean?

21,509. Yes?—I am not able to give any data with regard to drops; we hear different tales, and, as I said before, those stories are not always reliable. Farmers, as a rule, who take farms are very reticent as to the rent they give or agree to give.

21,510. Would you say that there is or is not competition for those farms?—Not much competition; scarcely any.

21,511. But still the landowners have been able to find tenants?—Yes, for almost every farm.

21,512. Are they from people in the district?—Recently there has been an influx of people from a distance for a few farms, from Cheshire and elsewhere; one or two from Cumberland and Northumberland, and up that way.

21,513. Are these men with sufficient capital?—Well, that is a point on which I should not like to hazard an opinion.

21,514. It is difficult to say?—It is difficult to say.

Capital required for stocking farms.

21,515. What capital is required for the farms in your district; say 150 acres?—We reckon from 7*l.* to 10*l.* per acre would be a fair capital.

21,516. Mainly for stock?—Mainly for stock. But 10*l.* an acre would be a good capital for everything required on the farm, including household furniture.

21,517. With reference to the farms which have been let, have they been stocked sufficiently?—In some instances. In the instance of the largest farm that has been at liberty during the last spring the man is now taking more or less lay stock, that is, agisted stock. But I believe that is owing to the fact that he was not able to induce his landlord to take the other farm off his hands.

Reduction of rent.

21,518. In your own case, have you had to make considerable abatements?—No, I have made one or two voluntary abatements that were not asked for.

21,519. Have you made any permanent reductions?—Yes; in one or two cases.

21,520. Take the average of your property; what should you say is the average reduction?—I have so little that it is scarcely worth citing; but I think about probably 10 or 15 per cent.

21,521. You say that that is the general average of the district, or what?—I am not aware that there is any general drop at all that we can cite.

21,522. Have the landlords been in the habit of making abatements or temporary remissions?—There is not much of the former. On the large estates there has been no large abatement.

Tenure.

21,523. Will you go on further with the causes of depression?—I think that one leading cause, which relates more to the past than to the present, is the absence of legal encouragement for men to farm well. Farmers were able to farm well enough when they made money enough, and would have continued to do so if they had been encouraged. At present, if they had that encouragement, I am afraid that they have not the ability to farm as they might have done 15 or 20 years ago.

21,524. What is the general character of the tenure, are they yearly tenancies?—They are yearly tenancies; it is almost universal, there is scarcely anything else.

21,525. Has that always been the case?—That has always been the case.

21,526. There has been no change from leases to yearly tenancies?—Not in my recollection; nor is there any tradition to that effect.

Prof. J. P. Sheldon.

31 May 1894.

21,527. Whatever the causes are in that direction, the circumstances are the same now as they were, I presume, namely, that the tenancies are yearly tenancies only; but I rather gathered from you that in consequence of the depression of agriculture, there is less inducement to the tenants to spend capital on the land than there was?—Yes, of course there is less inducement. Owing to the low prices, the reduced prices for everything they have to sell, there is less inducement to farm well.

21,528. Is that due to want of capital or want of security? Of course it would seem that the conditions of tenure must be the same now as they were some years ago?—It is not so much owing to want of security now as it was some years ago. It is owing more now to the drop in prices.

21,529. I rather gather from you that when the farmers had capital, then the want of security was a more potent cause than it is now when they are without the capital?—In those days, when farmers made plenty of money, they were perfectly willing to employ it on the farms, as a general rule, had they sufficient encouragement to do so.

Deterioration in farming.

21,530. Taking the average of farms in your district, do you think that they are in want of improvement?—Yes; the land has gone back in condition in late years, say since 1879.

21,531. Is that from want of application of manure, or want of tillage, or what?—To a great extent to the want of proper manures in sufficient quantity; but also owing to the character of the seasons, which have greatly injured the quality of the land.

Bad seasons.

21,532. When did those bad seasons begin?—The worst of the early ones was in 1879.

21,533. I thought that a few years after that the seasons improved?—They did a little, but then they went worse again.

21,534. When did they go bad again in your district?—I could not give the exact year, but they went worse again in 1884 and 1885.

21,535. Would you say that the land has been, on the average, seriously deteriorated by a succession of bad seasons?—Appreciably so—even seriously so, because a small deterioration is serious.

21,536. Does that apply to grass as well as to arable land?—Yes.

21,537. Am I to understand also, partly in consequence of the seasons, and partly the low prices, farmers have not been able to apply so much manure to the land?—Recently they have not been encouraged to do so, owing to the different causes I have mentioned.

21,538. When you speak of encouragement, what do you mean?—In selling produce at good prices, that would be one encouragement. Sufficient security for improvements in the case of those who leave their farms, would be another encouragement, but that is not so potent now as it used to be

21,539. That must always be in force to whatever extent it exists?—It is in force still, but not so to the same extent as 20 years ago.

Foreign competition.

Margarine.

21,540. What other causes do you give for agricultural depressson?—Foreign competition, especially that which I should call deceitful competition, namely, such as margarine, which is coloured to imitate butter; the change of name from butterine to margarine has had practically no effect in educating the public.

21,541. What do you mean by change in the name?—The change in the name has had little effect so long as the people who sell margarine make its colour the same as butter; it passes as butter with a great many consumers in spite of the name.

Prices of dairy produce.

21,542. Have you any data showing the range of prices for butter, cheese, and milk for a considerable number of years?—I have not got up this data, but I can give the figures tolerably accurately. In the year 1874, the first time that the cheese factory with which I have to do was opened, the cheese then sold at an average of 80*s.* 9*d.* per cwt.; now the same cheese would not make certainly more than 55*s.* per cwt.

21,543. It would be interesting to have the price year by year over that period?—I could supply you with that, but I have not brought the figures with me.

Prof. J. P. Sheldon. 31 May 1894.

21,544. We should like to have that added to your evidence?—I will obtain figures. (*The witness subsequently furnished the following figures*) :—

HOLNES CHEESE FACTORY, Sheen, Ashbourne.

Average price of cheese for 20 years :—

	s.	d.	
1874 - -	80	9	per cwt.
1875 - -	75	0	,,
1876 - -	68	0	,,
1877 - -	70	0	,,
1878 - -	52	0	,,
1879 - -	55	0	,,
1880 - -	55	0	,,
1881 - -	58	0	,,
1882 - -	60	0	,,
1883 - -	63	0	,,
1884 - -	55	0	,,
1885 - -	50	0	,,
1886 - -	50	0	,,
1887 - -	50	0	,,
1888 - -	55	0	,,
1889 - -	58	0	,,
1890 - -	58	0	,,
1891 - -	59	0	,,
1892 - -	60	0	,,
1893 - -	58	0	,,

21,545. And butter, too?—As to butter, I have known it sell at 2*s.* per pound in the local markets; the other day, at Ashbourne, it was selling with difficulty at 6*d.* per pound—good milk butter.

21,546. Let us have something more than what you have known in a particular case?—I could not give it year by year in butter—in cheese I could give it, but not in butter.

21,547. In the case of milk, what do you say?—I daresay I could obtain that for you. But I had this from a relation of mine who deals very largely in milk, sending it into various towns and cities in England; and he says that the price he gets is 20 to 25 per cent. less now than it was 20 years ago, and the rate of carriage on the railways is about the same as it was 20 years ago.

21,548. (*Mr. Giffen.*) How much per gallon is that?—That I cannot state, but I can ascertain it. (*The following prices in milk in Derbyshire, as given by a large wholesale dealer, were subsequently furnished by the witness*) :—

Year.	Summer.	Winter.
1870 - - - -	7½*d.* per gallon -	8½*d.* per gallon -
1874 to 1876 - - -	7½*d.* ,, ,, -	9½*d.* ,, ,,
1878 to 1882 - - -	7*d.* ,, ,, -	9*d.* ,, ,,
1884 to 1885 - - -	6½*d.* ,, ,, -	8½*d.* ,, ,,
1886 to 1894 - - -	5½*d.* ,, ,, -	8*d.* ,, ,,

21,549. (*Chairman.*) But if cheese has fallen in the proportion that you speak of from 80*s.* 9*d.* per cwt. to 35*s.* per cwt.; and if butter and milk have gone down 25 per cent. it is difficult to see how rents could have been maintained?—In the good years, 20 years ago, farms were paying farmers very well in my part of the country; but at the present time it is only one in many who is making a fair profit.

21,550. Are they losing money?—Some of them are losing money; a few have had to go to the wall, while others have given up.

21,551. Are the others holding their own?—The bulk of them; others have gone to the wall, and others have given up to avoid that.

Rating. 21,552. Taking the average of farms, should you say that their assessments for rating have been reduced at all or not?—There is a grievance in that; inasmuch as rents having been kept up rates have also been kept up; whereas, if the rents had dropped the rates would have dropped proportionately. In some unions they have taken the rent purely as the basis of rating. I happen to be the chairman of an assessment committee, and we have never until recently gone on that basis, because we have considered it a double injustice on a man highly rented to rate him accordingly, whereas a man who is low rented would receive a double benefit in being rated low.

21,553. You have not taken the rent as a basis of value?—As a guide, but not as a basis.

21,554. Have you reduced the assessments of farms?—There have been so many complaints of the great injustice, and there have been so many remissions or abatements of rent at various per-centages, and those complaints have been brought before us so often that we have decided now to go on rents pure and simple as a rule. We have made that change within the last few months. *Prof. J. P. Sheldon.* 31 May 1894.

21,555. You have decided to go on rents?—We shall make it a rule now, whereas we never made it a rule before. That is in the Union of Leek in Staffordshire.

21,556. Why did you make the change?—Because of the drops of rent in individual cases, not so much on the large estates; and because also of remissions of rent which people who have appealed to us have shown to have taken place, and they have claimed reductions of rating.

21,557. Have you refused those reductions of rating?—We have not lately; wherever we have had proof given to us of dropping of rent we have reduced the rates.

21,558. Instead of making the permanent reductions the landlords have made abatements from year to year; have you kept up the assessments or made reductions of the assessments in those cases?—We have taken no notice of the abatements, especially where they have been so irregular as they have been; but we have made allowance where the abatement has continued for some time.

21,559. Then the landlords instead of making permanent reductions have made abatements from year to year?—They have made remissions.

21,560. They have made remissions from year to year irregularly?—Yes.

21,561. And in this case the tenants have not had the full benefit of the reductions in their assessments?—We have not considered that a sufficient reason; but have proceeded on the gross estimated rental.

21,562. What is the name of the union?—Leek.

21,563. Has the total assessment of the union been lowered, or not?—It is lower, so far as the rural portion of the union is concerned, but in the urban portion it has increased pretty rapidly.

21,564. What is the reduction in the rural part?—I could not tell you now.

21,565. Perhaps you will add that to your evidence?—I can probably obtain those figures from our clerk, and, if so, will send them on to you. (*The witness subsequently supplied the following information*) :—

RATEABLE VALUE of the RURAL PORTION of LEEK UNION (Staffordshire). One urban, one mining and manufacturing, and two residential parishes being omitted, the object being to show the fluctuation in 20 years.

1874.	—	1894.
£ 56,042	18 parishes - -	£ 55,843

From the aggregate of 1894 ought to be deducted some 300*l.*, which represents increase in rateable value of railway property in three parishes. This would show the small decrease of 500*l.*, or barely one per cent., in the rateable value of these 18 parishes in 20 years.

Margarine. 21,566. (*Captain Owen Thomas.*) What is the natural colour of margarine?—It is very pale; very white. It is made from animal fat, which is much more nearly white than butter is. With reference to margarine I think it ought not to be coloured at all; it ought to remain in its natural colour.

21,567. (*Chairman.*) As there is a Committee of the House of Commons going to sit on this subject, perhaps it will be sufficient with regard to that point to say that the Act with regard to margarine ought to be altered so as to give better protection to the farmers who produce dairy produce?—I think certainly the colouring of margarine ought to be prohibited. Then we have cheese made to imitate cheddar and stilton. That is made in the United States and Canada. I do not see how we can interfere with that. Cheese.

21,568. When you say it is made in imitation of cheese I presume it is cheese; it is not something else?—It is cheese; and so I do not see how we can interfere with that, but it is one reason of the present depression, so far as many parts of the country are concerned, that is in the great cheese producing counties.

Prof. J. P. Sheldon.
31 May 1894.

21,569. They produce cheese not quite equal to the cheddar, but it comes in competition with it?—I do not believe that cheddar cheese or stilton cheese made elsewhere can equal the cheese of our own country.

21,570. But they produce a cheese which though not equal to our cheese yet comes in competition with it?—Undoubtedly.

21,571. And tends to lower the price of our best quality?—I daresay you know that you seldom meet with a stilton cheese worth eating now-a-days, whereas, 20 years ago, you could commonly meet with one.

21,572. What is that due to?—It is due to the stilton cheese coming so freely from abroad, and cutting down the prices. Our own stilton cheese makers were able to make them with double cream, that is, skimming the night's milk, and adding the cream to the morning milk; that is, double cream.

21,573. Has the competition for cheese of a somewhat less quality been so great that the producers of it have been induced to lower the quality of this cheese?—In the case of Stilton, this is true.

21,574. (*Mr. Chaplin.*) Would not a better cheese, the old fashioned ones, command a better price than the foreign ones?—I believe the demand for anything very high priced has considerably fallen off, even where the quality is good.

21,575. (*Mr. Channing.*) But some of these competing American cheeses are made of margarine?—In the United States, some years ago, it was made of margarine, but that so demoralised the name of American cheese, that they have to some extent left it off.

21,576. (*Chairman.*) Have you got any cheese or butter factories?—Yes, a few; eight or ten.

21,577. Have they answered?—They are going still, and answer fairly well; I believe the cheese is better than the average farmhouse cheese.

21,578. Do they tend to raise the quality of the cheese? They raise the average quality of the cheese. I doubt whether the cheese factory will produce the finest possible cheese, equal to that of the best farmhouse. But where you find a farmhouse that has a fine quality of cheese, you will find 10 farmhouses with a more or less inferior quality.

Butter.

21,579. And instead of these 10 producing an inferior quality when they send it to the factory, the result is rather to make it better than the average quality?—The average quality of cheese has increased, and so too with butter more particularly. I believe that butter suffers more from being made in farmhouses; it not only suffers from want of knowledge of the persons who make it, but from want of accommodation, and it also suffers in the market from want of uniformity, and that is of the greatest possible importance in this age.

Dairy factories.

21,580. Is there room in your district for more factories?—Yes, I think there is room for more, but the milk trade has been checking, for some time past, the establishment of cheese or butter factories with us.

Security of tenure.

21,581. Will you give us your opinion on the subject of land tenure?—With regard to land tenure I think I have already stated the gist of my opinion, namely, that we have at the present time no Act of Parliament which gives sufficient encouragement to farmers to farm well, and which gives them sufficient security for the capital which they may bury in the soil.

21,582. What do you suggest?—I should suggest an Agricultural Holdings Act very greatly improved, and made much more liberal to tenant farmers. In the end that would be a great benefit to the landlords. I believe that the landlords who have hindered the process in Parliament of giving this due security to tenant farmers, have been blind to their own interests all along.

21,583. What changes do you recommend?—Such changes as would secure to a tenant, when he left his farm, that he would receive the full value, no matter whether it rose or went down, of the unexhausted improvements which are an advantage to his successor. Also, and perhaps even chiefly, such security as would give to a man who was not quitting his farm, the value of his improvements before the rent was raised, or could be raised.

21,584. Take the case of the dairy farmers of your district; what are the specific recommendations you have to make for the amendment of the Agricultural Holdings Act?—I do not know whether I could give you offhand any specific recommendation on that point.

21,585. (*Mr. Channing.*) They require good buildings, do they not?—The buildings as a rule are tolerably good. The buildings themselves are not vital, because a man cannot get his rent out of the buildings. Of course good buildings are a great convenience, but what he wants is proper and ample security that he shall receive, when he leaves his farm, or before his rent can be raised, if he happens to be remaining, the full value of whatever he has done to increase the value of that farm to an incoming tenant for instance. I should be inclined myself to give him the right of free sale of improvements. I speak now as a landowner, as a yeoman farmer; as a man who has tenants of his own. I am perfectly prepared to give the right of free sale of those improvements, and in the end and before long I think that landlords will perhaps wish they had done so.

Prof. J. P. Sheldon.
31 May 1894.

Free sale of improvements.

21,586. I do not quite understand what you mean by "free sale." Do you mean that the tenant is to have the right of selling his interest to any fresh incoming tenant without the consent of the landlord?—Yes; but let the landlord buy that interest if he likes.

21,587. Supposing the landlord does not wish to take the land himself, would you allow the tenant, without the consent of his landlord, to sell his interest in the farm to any other incoming tenant?—Yes, just as a London shopkeeper would sell the goodwill of his shop to an incoming tenant.

21,588. Would you give the landlord any choice of the tenant?—You could not give him that choice, unless he bought the improvements himself. In many cases it would be worth while to purchase those improvements; he would have money value for them, and his farm would let for so much more.

21,589. Then he could let the farm to whom he liked?—Yes.

21,590. (*Mr. Lambert.*) In defining the tenant's interest would you term goodwill of the tenancy of the farm as his interest, or were you only referring to improvements that the tenant has made?—Purely to improvements, the other thing does not count a bit; at least, it ought not to count. I am speaking purely of improvements. I should not care to establish a second proprietary interest in the land, except in so far as it had been created by the tenant who was leaving; and in the case of the sale of such improvements I think I should leave to the judgment of the man who wished to buy them, and become the incoming tenant, what he gave for them.

21,591. (*Mr. Chaplin.*) Do you put any check upon the rent that the landlord may charge?—The rent would be the same.

21,592. (*Chairman.*) Supposing the landlord was to raise the rent next year?—Then he must pay the farmer the current value of those improvements and the farmer could go or stay.

21,593. You would not pay what the incoming tenant had paid?—Not necessarily.

21,594. He would only pay for the improvements effected within a reasonable period?—The improvements would cover the time for which they had been previously paid for so long as they were unexhausted.

21,595. So long as they were unexhausted?—Yes.

21,596. (*Mr. Chaplin.*) When is the rent to be fixed, and who by?—It is to be fixed between the landlord and tenant to begin with, at all events.

21,597. When are the improvements to be sold?—When the man leaves his farm.

21,598. When is a person to buy the improvements?—When the other man leaves the farm.

21,599. A man may leave a farm without the other taking it; are they to be bought and sold before the rent is fixed?—I assume the rent would not be altered. The incoming tenant would take it at the same rent or what it was worth.

Judicial rents.

21,600. (*Chairman.*) Do you think that such a proposal is possible without a process of fixing the rent by a judicial tribunal?—I am not quite prepared to give an immediate answer to that. There is a great deal in that point.

24,601. Perhaps you recollect that at the time the Irish Land Act was discussed, it was considered that free sale of the tenants' interests almost necessarily, if not actually necessarily, involved the determination of rents by an independent tribunal. Taking your own proposal, giving free sale to the tenant, do you think that that would involve the judicial rent?—I think it would, inasmuch as farms vary as to their letting value; that, as the times

Prof. J. P. Sheldon.

31 May 1894.

alter, a farm is worth more or less than it was 10 years before, and therefore a revision of rents would be necessary. But what I object to is, that there should be a revision of rents owing to the improvements that the tenant farmers have put into the soil. That is the thing I object to; that a tenant farmer should have his rent raised, according to the common saying, "On his own improvements"; whereas, if he had not improved that farm, the farm would not have borne an increased rent.

21,602. I suppose it might be possible to meet the point by proper provisions between the landlord and the tenant so that the tenant should obtain sufficient compensation from the landlord on leaving his holding?—From the landlord or the incoming tenant.

21,603. But you are now proposing that he should have the free right of sale?—Yes, the free right of sale.

21,604. The question is whether as a necessary condition of that free right of sale, would it not be necessary to have a judicial determination of the rent?—I think that it would be necessary in many cases.

21,605. Are you favourable yourself to judicial determination of rent?—Yes, I think I would be.

21,606. Do you think that that determination should be for a term of years?—It is difficult to lay down any hard and fast term of years under which that system would work well, because the fluctuations from prosperity to depression are too rapid; sometimes we have prosperous times when things go up rapidly, and at other times they go down rapidly in two or three years.

21,607. The same difficulties and objections that tenant farmers now feel about taking leases would apply also to any proposal to fix a term for the judicial rent?—I don't know that it would necessarily apply in that case; but farmers in my part of the country would not wish for leases under any circumstances.

21,608. That I rather gather; but would they be willing that the judicial rent should be fixed for a term of years?—I think that they would, especially at the present time; and I think we are not sure that things are not going to be worse than they are.

21,609. Supposing it were for a judicial term of seven years; at the end of that time in your opinion should the tenant have a claim for a further period and so on?—Do you mean to have another fixing at the end of the period?

21,610. Yes?—Well, I do not think that I should object to a rule of that sort.

21,611. I want to know what your proposal is?—My chief proposal is that the outgoing tenant or the sitting tenant, before there is any alteration of rent, should receive what is properly due to him.

21,612. But you think that that would probably involve a judicial rent and that you were favourable to judicial rents. Now assuming that, I want to know whether you would involve a renewal of the judicial period?—I thought you wanted me to state whether I thought that renewal should be made periodically at stated periods.

21,613. Quite so?—I suppose it would have to come to that in the end—either seven to 10 years.

21,614. Practically it comes to making the tenant part owner of the land?—For the time being.

21,615. But if those judicial terms are to be periodically renewed that would mean giving the tenant a perpetual right, would it not?—I do not think so; I do not see that it necessarily would. I think that the landlord must still have power to give notice for the man to leave if he wants to.

21,616. (*Mr. Channing.*) On specific grounds?—On specific grounds.

21,617. For instance, if he does anything that is inconsistent with his reasonable tenancy?—Yes.

21,618. (*Chairman.*) Do you mean at any time, or only at the end of the term?—At any time.

21,619. Then the judicial period would be subject to the landlord giving notice when he thought fit, or the tenant on his part giving notice?—I think that both parties should be at liberty to give notice between times. Besides if you are to give a tenant full legal security for his improvements you must give the landlord proper security against deterioration. What is "sauce for the goose is sauce for the gander." I consider if landlords in the past had given this security which I speak of to tenant farmers, that there would have been fewer farms thrown on the landlords' hands than there have been, because the farmer having buried a good deal of his own capital in the soil would be very reluctant to leave it. He would feel that in a falling market he would not get the full value of what he had put into it, and therefore he would hang on longer.

Prof. J. P. Sheldon.

31 May 1894.

21,620. But short of judicial rent and of free sale of the tenants' improvements, are there any recommendations which you would give for the amendment of the Agricultural Holdings Act?—The Agricultural Holdings Act of 1883 has a fault inasmuch as it has various permissive features, and those are very confusing to the ordinary tenant farmer mind. The tenant farmers, as a rule, have not judicial minds.

The Agricultural Holdings Act.

Section 3.

21,621. (*Mr. Little.*) What are the permissive features?—In section 3 it says that the landlord and tenant may enter into an agreement in respect to compensation under the first schedule, and such compensation—these are the words of the Act—"shall be deemed to be substituted for "compensation under this Act."

21,622. That is conditional on its being fair and reasonable?—Well, the Act of course says that it must not contravene the spirit of the Act; but we know that you can drive a coach and four between those things tolerably easily if you like. Then section 4 says compensation under this Act shall not be payable unless the tenant has given notice of his intention to execute specific improvements under schedule I. The second paragraph says: "The landlord and the tenant may, if they think fit, "dispense with any notice under this section, and come to "any agreement between themselves."

Section 4.

Consent of the landlord to improvements.

21,623. (*Chairman.*) How do you think that should be dealt with?—I think that it should be definitely laid down so as to make it impossible to have any opening for the landlord and tenant to come to terms on this point, because they do not meet together on terms of equality. The landlord is the much more powerful of the two, and could exact his own terms from the tenant farmer, and therefore, to save the tenant farmer from his own weakness and the superior strength of the landlord, the Act ought definitely to lay down these things.

21,624. Before you pass from that Act, that clause applies only to the first schedule of the Act?—Yes.

21,625. And mainly to improvements which are generally known as landlords' improvements, such as buildings and so forth?—Yes.

21,626. Are we to understand that you think that the tenant should be entitled to make the improvements without the consent of the landlord?—Yes, I would give him that power. But, on the other hand, I would award him nothing for them unless they were really valuable to the farm, and if he happens to be foolish enough to put up unsuitable and otherwise useless buildings, then he should receive nothing for them; that should be his punishment.

21,627. You would give him full power to erect any kind of buildings that he thinks fit?—Yes, you might venture to do that.

21,628. Or any kind of planting?—No, I would not say that necessarily.

21,629. Planting of orchards?—Orchards, perhaps so, but not ordinary plantations; however, a tenant would not do that.

21,630. Then, as to the making of gardens or the making of roads?—As to the making of roads, decidedly he ought to be able to make roads as he likes; he would not be foolish enough to make a road where no road was wanted; if he were, he would be punished by receiving nothing for it at the end.

21,631. You think that the landlord's consent ought to be dispensed with in the first schedule?—It might safely; at all events these things might be definitely known that they cannot agree between themselves to contract out of the Act. Then section 5 in paragraph I. says the Act does not overrule "a contract of tenancy current at the com- "mencement of this Act, any agreement in writing, or "custom, or the Agricultural Holdings Act of 1875," so that it is not a compulsory Act if it does not overrule these things. Then paragraph II. says, "Any particular agree- "ment in writing which secures fair and reasonable com- "pensation shall be deemed to be substituted for compen- "sation under this Act." Then in section 33 it permits the landlord and tenant to set aside the Act in reference to notice to quit. The Act says 12 months, but they can substitute a six months' notice if they like. I am at a loss to conceive why that should have been put in the Act, because a good deal was said about the value of a 12 months' notice in comparison with a six months' notice, and yet in the Act, when it comes to be passed, permission is given that a six months' notice may be substituted for the 12 months' notice recommended in the Act. Those are the permissive features to which I take objection in the Act of 1883.

Section 5.

Prof. J. P. Sheldon.

31 May 1894.

The Agricultural Holdings Act and the custom of the country.

21,632. Are there any further amendments which you would suggest?— None occur to me for the moment. The farmers in my part of the country do not consider the Act of any value. They do not appeal to it; it is very complicated, and, another thing, it gives them an idea that they get something with one hand which is taken away with another, and it greatly puzzles them, and having tried to understand it and been puzzled once or twice in trying to understand it they throw it down in despair and prefer to have nothing more to do with it.

21,633. When a tenant takes proceedings are they taken under the Act?—As a general thing the valuers meet together and go on the old lines for the most part.

21,634. Is that because the custom of the country is better?—Not perhaps only that, but that is one reason, because the custom of the country is a thing they understand, and the Act is a thing they do not understand.

21,635. The basis of the Act was to leave customs which were better than the provisions of the Act, was not that so?—Was that the intention of the Act?

21,636. Yes?—The Act had so many intentions that it is really difficult to say that that was so or not. I am not quite clear about it.

21,637. Is it not the effect of the Act that it is compulsory in all cases, unless where the custom of the country is more favourable than the Act?—Compulsory? at all events it is not employed universally; it is left aside and expressly ignored.

21,638. In your own case the tenant farmers prefer the custom of the country, they thinking that it is more favourable, I suppose?—Yes, I think they do; I think that the custom is more favourable.

21,639. And therefore they proceed under the custom rather than under the Act?—Yes; I think that is so. But under the Act, in cases where they have used the Act the tenant farmers have complained to me afterwards that they have not been properly treated. I have a few instances; I can give you one of a tenant farmer who farmed on one of the largest estates in my part of the country under a noble landlord. He gave up a farm of some 500 acres, and he mentions one thing: he says that he had close on 900 roods of walling, the rood is 8 yards, that is re-building the old walls that had become decrepid; and he also put down 47 new gate posts, and for none of those did he receive one penny of compensation when he quitted that farm.

21,640. (*Mr. Little.*) Was he under an agreement?—There are always agreements of one kind or another on the large estates.

21,641. Did he contract to keep in repair the walls and gates?—Possibly to keep in repair but not to rebuild, rebuilding is very much more simple than keeping in repair; besides a man would not contract to put down new gate posts and receive no compensation for them, but he simply did put them down.

21,642. (*Mr. Elton.*) Did he supply the gate posts or only put them in?—My friend bought them. There are none on the estate there, I happen to know the estate.

21,643. That is important?—He got them from the nearest sandstone quarry a mile or two away, where people get these and sell them, and it is not on the estate.

21,644. (*Mr. Lambert.*) Had the tenant by his agreement to put down these gate posts?—I do not think so, I do not remember ever seeing such a clause in an agreement.

21,645. (*Captain Owen-Thomas.*) Did the tenant know, at the time that he was putting them down, that he would not be compensated when he left?—That I cannot tell you, for he has not said that to me, but he assumed that it would be under the old custom of the country and he would expect to be paid for them.

21,646. Is that the custom of the country?—Yes, but I am given to understand that the Act was called into force in his case.

21,647. (*Mr. Channing.*) He claimed under the Act and therefore excluded himself from the benefit of the previous custom?—Yes, from the benefit of the previous custom.

21,648. (*Chairman.*) He made a mistake in proceeding under the Act instead of the custom of the country?—Yes. Several farmers have burnt their fingers under the Act.

21,649. And he would have been much wiser if he had proceeded under the custom?—Yes.

Insufficiency of the Act.

21,650. (*Mr. Channing.*) Does not that show that the Act is insufficient?—Yes, the Act is insufficient; it does not cover such a thing as this which is common, namely, the getting out of rocks. Before you can plough the land you have to take out the rocks which are in the way of the plough. On the Derbyshire hills it is very common on the land ploughed, that the carboniferous limestone rock comes to the surface in various places, and this wants blasting off before the plough can be used; and the farmers have done that almost universally; and they have used the stone so got for the rebuilding and repairing of walls—walls which existed before they took the farms but which had become dilapidated and required repairs.

Prof. J. P. Sheldon.

31 May 1894.

21,651. (*Chairman.*) You think that improvements of of that kind ought to be included in the third part?—Yes, such as levelling the land and getting out the stone, and rebuilding the fences, not merely the repairs. I would say that the rebuilding of walls is practically the same thing as the replanting of hedges and quite as expensive a process.

Increased rents and valuation of improvements.

21,652. Then, with regard to the sitting tenant and the security for his improvements as against the raising of the rent, apart from the question of the judicial rent, if your proposal with regard to the judicial rent was adopted, the question of the sitting tenant would not arise. But I am now asking you for any suggestions for the amendment of the Act short of the judicial rent for the protection of the sitting tenant?—The Act ought to declare distinctly in words which could not be interpreted into being permissive, that when a landlord wishes to have an increase of rent for a given farm—no matter what the reason for that increase may be—it may be because everything is better, and the land deserves greater rent, or it may be for some other reason—but before getting that increase of rent, the tenant who as sitting tenant is living on the farm ought to be paid the current value of the unexhausted improvements; and after receiving the value, he can then take on again, or leave the farm if he thinks proper and let a new man come in.

21,653. Then every rise of rent would be accompanied by a valuation?—It would be accompanied by a valuation.

21,654. And then if the improvement is a tenant's improvement, the sitting tenant would have, as it were, to pay himself for it if it is a tenants' improvement?—No, he would receive ——

21,655. Supposing an unexhauted manure, as a continuing tenant he would get the benefit of that improvement?—Yes.

21,656. Would you require that the landlord should pay for an improvement for which the tenant is going to get the benefit?—Yes. I presume that the rent is to be increased. I say that before the rent is increased the tenant should receive the capital value of his unexhausted improvement.

21,657. It seems that would work in the case of permanent improvements; but in the case of improvements which are not permanent, which are likely to be exhausted, I do not quite see how it would work. The landlord would have to pay the tenant for the unexhausted improvements, but the tenant would then go in and would get the benefit of those unexhausted improvements, although the landlord has paid for them?—Yes; and in return for paying for them the landlord would get an increased rent, not only a rent increased owing to the natural increase of the value of the farm in case things are going up as they did 20 years ago; but also an increase of rent on those very improvements which the tenant has made.

21,658. That I understand with regard to permanent improvements and not unexhausted improvements, say, for manure?—I recognise no difference between permanent and temporary improvements with regard to compensation.

21,659. (*Mr. Channing.*) It is only a question of the assessment of the value?—It is only a question of the assessment of the value.

21,660. (*Mr. Elton.*) Supposing there is one year value of a particular unexhausted improvement left that is paid for by the tenant he naturally comes in again, and in the course of the 12 months he takes any unexhausted value out of the ground. Would not it seem very inconvenient to all parties, and in the view of the farmers also as well as the landlord, that he should get a sum of money for those improvements and should then in the next 12 months be putting the value of it into his pocket again?—Do you mean this, that a man is paid down for a 12 months unexhausted improvement, and he takes out presumably the value in the succeeding 12 months?

21,661. Yes?—When he leaves at the end of 12 months he gets nothing; he has taken it out.

Prof. J. P. Sheldon. 31 May 1894.

21,662. (*Chairman.*) Is he not paid twice over?—How can he; the year of life which still remained in the improvement is exhausted, there is nothing left at the end of it.

21,663. (*Mr. Channing.*) That is on the hypothesis that the landlord would have increased the rent in proportion to the 12 months' value of this improvement, would he not?—Of course he would. Suppose a man takes a farm for one year, and the improvements have two years to run, if he has paid for the two years' improvements he leaves one behind, if he quits at the end of the first year. There has always been great difficulty with reference to this question of land tenure, which we ought to make a serious effort to overcome. I have a special case which I can give you, with which I am thoroughly acquainted, with reference to the insecurity of tenants.

21,664. (*Chairman.*) Let us have that case?—This refers to a farm in Derbyshire of 320 acres. The tenancy lasted something over 40 years. It commenced about 1837 or 1838, I am not quite sure, and at that time the farm carried 25 dairy cows, and 65 breeding ewes, with young stock and horses in proportion, and that is all that that farm would do. There is a man now living who was a servant on that farm, if not in the first year or two at any rate within the first four or five years of the tenancy. I am speaking of from 1837 to 1841 or 1842, and he has repeatedly told me of the condition of the farm at that time. There were 200 acres of arable which was ploughed in rotation, lying several years in grass, and it was full of twitch. During the first quarter of a century that the tenant held the farm he laid out all the money he could make in improvements. The times were gradually improving, and farmers were gradually making more year by year, and they were able to farm well. He farmed well because he was one of those men who would farm well; he could not bear to farm from hand to mouth; and beyond that he had the encouragement of promises repeatedly and voluntarily given by the landlord that the rent would not be raised whilst he lived.

21,665. Not while the landlord lived?—Yes. For the first 25 years, all the spare money he made was laid out in improving this farm; and at the end of that period of improvement it carried 45 dairy cows, 120 breeding ewes, and even more than these, with the young stock in proportion again, so that the stock carrying capacity of the farm was nearly doubled. The tenant raised the condition of that farm to a very high pitch, with bones chiefly. It was land on which bones answered remarkably well with the dry carboniferous limestone; and, as we all know, bones are a very lasting improvement even more so than anything else we can apply to land in the form of manure. All this land was repeatedly boned and got into a very high state of condition. When it had got into a permanently improved condition, notwithstanding the repeated promises on the part of the landlord, which were given without being asked for in every case, the rent was raised, and no reason was ever given why that rent was raised.

21,666. When was it raised?—It was raised about 1870. A few years later than that the tenant died.

21,667. Do you know what the raising of the rent was in that case?—It was not a great rise, but it had such an effect upon the man's mind that it shortened his days, because he lost his confidence in the man of whom he thought most; he died in 1875. His son succeeded him and gave up the farm four or five years later. During the time the son was on that farm the repeated applications of bones to that land were supposed to be exhausted, because they had been applied for so long a time, and there was nothing under the custom of the country which would give any compensation for them.

21,668. Had the son not continued the process of applying bones to the land?—He had not any need to do so, the land was rich enough for all practical purposes.

21,669. (*Mr. Lambert.*) How long had he discontinued boning the land?—He had not entirely discontinued the use of them, but he had no occasion to use them as they had been used in the first 25 years.

21,670. (*Mr. Channing.*) The land was capable of carrying the stock, I suppose?—It threw up more herbage, and so the land was kept up in quality.

21,671. (*Mr. Lambert.*) How long had he ceased to apply the same amount of manure that his father had done; when did he slacken?—His father began to slacken before he died because there was no need to go on improving at the same rate.

21,672. How long before the determination of the tenancy was that?—12 or 14 years.

Compensation for "boning" land.

21,673. Would you consider that compensation should be paid for the boning of the land 12 years after it has been put on?—Yes; and in 50 years in many cases. I could show you the effect of boning the land 50 years ago, and you can see the improved quality of the grass to day.

Prof. J. P. Sheldon. 31 May 1894.

21,674. Would that be raw bones?—Raw bones. There were only raw bones used in those times.

21,675. Was it bone meal or half-inch bones?—Half-inch raw bones; those are what he used during the 25 years when he improved the land.

21,676. Would there be many half-inch bones used at the present day?—They are used pretty considerably, but nothing like what they were, dissolved bones and superphosphates, and so on, are used now.

21,677. (*Chairman.*) Would you say generally that the effect of bones is to last as much as 50 years?—It depends upon the character of the land; you can see the effect of boning 50 years ago in favourable cases.

21,678. (*Mr. Channing.*) That is where the land is well fed with plenty of stock afterwards?—Where the land is used in the ordinary manner you can see in the spring the difference between where the land has been boned and where it has not.

21,679. (*Chairman.*) In this case where the son gave up four or five years after the death of the father, did he get nothing on leaving his farm in the way of compensation for the expenditure on bones?—He got nothing whatever as compensation for bones, and what he did get amounted to very little indeed.

21,680. On the ground that so many years had elapsed since the real expenditure took place?—The time was considered to have expired. He left the farm before the Agricultural Holdings Act, 1883, was passed, and went on the custom of the country, under which the time had expired.

21,681. The custom of the country gives something for bones. What is the period allowed by the custom of the country?—Seven years on pasture, permanent grass, pasture, not meadow; and three years on land from which arable crops are taken.

21,682. How much is allowed, say, in six years?—One-seventh of the cost in each year in grass land, and one-third in arable land.

21,683. What do you say it ought to be?—It ought to be whatever value is left at the time, and of course that is extremely difficult to assess. I think the safest and fairest way is to offer it by auction, and see what practical men are prepared to give for it; you will get the value then.

21,684. That of course implies your recommendation as to the free sale of the tenants' improvement?—Yes, as to the free sale of the tenants' improvement.

21,685. But short of that if you were to amend the Agricultural Holdings Act without importing that principle what would you recommend with respect to the question of boning?—What we may call the life of bones varies so very much on different kinds of land that it is difficult to lay down anything, and the simplest plan would be to let it be sold and let the public judge what the life was worth that was left in it. Those who wished to bid for it would decide.

21,686. (*Mr. Little.*) The compensation is now given by the Act upon the value and not upon the time that has expired. There is no limit of time, is there?—I do not remember what the Act says. There is none in the Act, I think. This entirely depends upon the notions of the valuers as to the time they shall allow the improvement to cover, and they go naturally on the old ideas of bones having so many years of life, and other things having so many years of life.

21,687. (*Chairman.*) It would seem to be more the fault of the valuers than the Act?—To a great extent.

21,688. The Act gives unlimited power?—It is the fault of the valuer, but primarily the fault of the Act for not guiding the valuer. The Act should lay it down so definitely that no valuer could go wrong.

21,689. (*Mr. Little.*) Do you mean to lay down a scale?—Yes.

21,690. And that in the face of what you have already said that the same scale would not be applicable to different parts of the country?—I said there was a great difficulty in that; and therefore it would be extremely difficult to lay down a scale; one scale would not be sufficient, but several scales applicable to different kinds of land. It is extremely difficult, and for that reason I should advocate the free sale which would be a much simpler process.

Free sale of improvements.

Prof. J. P. Sheldon. 31 May 1894.

21,691. (*Mr. Elton.*) You used the expression "the tenant's interest," did you mean his interest in the unexhausted improvements?—Yes, in that.

21,692. That might be for a valuer. It is rather small in comparison with the larger values such as the landlord's interest, and it is conceivable that it might be a secured charge on the landlord's interest?—I do not see why it should not.

21,693. It is very easily conceivable that it might be secured on the landlord's interest?—Very easily.

21,694. Why put the landlords into so difficult a position as to say that the tenant should have the power of the free sale of improvements which gives the complete control of the tenancy to the person selling the improvements?—That is not the result.

21,695. It enables him to name the new tenant?—It does not give the control to the person selling the improvements but to the person buying them.

21,696. I thought he sold them to a person whom he would accept as purchaser. He is the one who chooses the new tenant and not the landlord?—No, he would not choose the new tenant.

21,697. At any rate he puts it up for sale and somebody purchases, the landlord does not take the new tenant?—The new tenant would choose himself by the act of purchase.

21,698. Is not the landlord intentionally put by your plan into a very much weaker condition than is necessary because he has a tenant, whom he has no voice in choosing, put on to his farm while the thing might be arranged on a fee simple?—As to the weak position in which you would reduce the landlord I do not think that in regard to many parts of England you could increase the weakness between the parties at the present day. Landlords would be only too glad now for a man to purchase the outgoing tenant's improvements and thus to become the incoming tenant.

21,699. You think that they would be willing to give up their power of choosing the new tenant, if they were told there was one coming who had bought the interest in the bones or the lime; that that would be sufficient for them?—I think as a general thing it would.

21,700. That they do not care who it is that is to come and look after their land?—As a rule landlords do not exercise much choice with regard to their tenants. When a man dies, for instance, a landlord does not exercise much choice about receiving the son; he does receive the son, as a matter of custom.

21,701. Does the landlord not consider whether he has capital or is industrious, or anything of that sort?—They give him a trial, even if he has not very much capital.

21,702. Even if a man has just got money enough to pay the interest on the bones, and goes as a speculatee?—I am not prepared to give you a definite opinion on that point

21,703 Mine was a very cautious question; why put the landlord in this position if you can make it very much easier for him by a charge upon the fee simple?—I do not think that it would be a matter of very great difficulty for the landlord after all; but it would be a matter of very great convenience for the tenant, and I am looking at that point, most of all. But I would not greatly convenience the tenant, and greatly inconvenience the landlord at the same time, if I could possibly avoid it, I should be going against myself if I did.

Margarine.

21,704. I will not ask you anything about the Margarine Act, except one question just to put another answer on the notes. I understood you to say margarine was always made of animal fat?—That is the basis for the most part.

21,705. Is it not also made to a great extent from cotton seed oil?—Yes, it is made from various kinds of oil—earth nut oil and many kinds that we do not know very much about.

21,706. Then cocoanut oil is mixed with it, is it not?—Yes, very likely.

21,707. Does your answer about the colour apply to those oil margarines as well as to the old-fashioned fat margarines?—Yes, any kind of margarine I think ought not to be artificially coloured so as to imitate butter.

21,708. Are the oil margarines coloured as well as the fat margarines?—They are all coloured I believe. I do not think any margarine is made which naturally, from the ingredients of which it is composed, has a colour high enough to imitate butter.

Prof. J. P. Sheldon. 31 May 1894.

21,709. I ask because I think railway grease is made of cotton seed oil, and that has a very fine buttery colour?—Cotton seed oil is too pale in colour to imitate butter. Besides, they would not make margarine of cotton seed oil, it is too soft, and they could only use moderate quantities of it; so that the colouring matter in the cotton seed oil would go a very short distance.

Condition of farmers.

21,710. (*Captain Owen Thomas.*) Would you say the farmers in your district are able to make their rents out of their holdings?—Now-a-days?

21,711. Yes?—Those who farmed well in the old times are able to do so, but a great many of those who farmed badly have gone to the wall, or left, or something. Those who farmed tolerably well years ago have had farms that were tolerably productive, and that has helped them along, and they have been naturally more reluctant to leave their farms than they otherwise would have been, and they have kept on farming through the bad times more or less.

21,712. And have been able—for that was my question—to make their rents out of their farms?—Yes, I think a good many are paying their way. They get remissions, which help them along. But these remissions are very objectionable. I think they demoralise the tenant farmers; they pauperise them, that is, they give them a sort of pauperising idea. They have a similar effect on the minds of tenant farmers generally to that which the law of distress has. This law of distress is a sort of penal indignity on tenant farmers.

Law of distress.

21,713. (*Mr. Channing.*) I do not think you have stated your opinion as to the law of distress; would you say what you would do with regard to the law of distress?—I would give the landlords—and mind you I speak as a landlord—just the same right to recover what is owing to them as I would give any other creditor of the tenant—that right and no more.

21,714. Are you in favour of the abolition of the law of distress?—I am in favour of the total abolition of what is called the law of distress. Let the landlord take his chance with other creditors.

21,715. Would you give your grounds for that opinion—have you any illustrations in favour of it?—I do not know that I have got any specific illustrations to give you, but I give my opinion based on long watching of this matter.

21,716. Do you think it would be to the benefit of the farmers if the law of distress were abolished?—Yes, I think they would be able to deal with tradesmen on easier terms to themselves if the tradesmen were conscious that they would have the same chance that a landlord has of getting their share of anything there might be in case of insolvency.

21,717. Do you think the advantage which the tenant gained in that way would counterbalance any possible disadvantage arising from having to pay the rent more promptly?—Yes, I think it would quite balance that. Besides, as a rule rents are paid tolerably promptly, I think, now-a-days—at least they have been for the most part. Landlords of late years have not been inclined to allow their tenants to fall very much into arrear. It would be to the advantage of the tenant also to keep him tolerably prompt in his payment of rent—tolerably so; at the same time the landlord would be understood to give such a fair amount of credit as any tradesman would give. There is an understood rule in those things. It is not easy to lay down exactly what you would do; but there is a rule which is understood.

21,718. Are you aware that in cases where the rent is paid in advance, the landlord has sometimes obtained distress for a longer period than the 12 months allowed by the Act?—I think he cannot claim now for more than 12 months rent in arrear under the Act.

21,719. I do not follow you; cases have been brought before us?—It has been done repeatedly in time back for five or even six years—the full limit. I think a landlord could claim for six years arrears under the old régime.

21,720. The cases I was alluding to are cases brought before us in which the rent was paid in advance, and yet under the present law the landlord was entitled under legal decisions to levy distresses for 12 months in addition to what had been obtained in advance?—But surely he could not levy for that unless he had some claim for it.

21,721. We will not pursue the question; we had evidence before us to that effect?—I have met with no instance of that sort at all events.

21,722. Are you of opinion that the right of distress should be not limited to 12 months only but should be got rid of altogether?—It should be got rid of altogether.

Prof. J. P. Sheldon.

31 May 1894.

21,723. About this question of the compensation for boning; the periods that you have named are what are usually taken by valuers I think; that is, seven years on pasture?—Yes.

Compensation for "boning" land.

21,724. And from two to four years on arable land?—Three years where arable crops are taken.

21,725. Of course it is more applicable to grazing farms than to others. As I understand it, the case which you have brought before us amounts to this—that where high farming has been carried out for a number of years and the stock carrying powers of the holding increased in that way, there is a tendency in that improvement to be permanent, and a man should have compensation for the full value he has thereby added to the land?—Those improvements would decrease very slowly indeed; so slowly that the lifetime of one man is not in comparison with them.

Increased rents and valuation of improvements.

21,726. The Chairman asked you as to the neeessity of having judicial rents fixed, but as I understand your evidence as to the protection of the sitting tenant, you think it is hardly necessary that there should be a judicial rent fixed in that case. What you contemplate I suppose is this: that where there is an alteration in the terms of the tenancy, the tenant should be entitled to say that there should be a valuation of what he has contributed to the current value of the farm?—Yes, I think so, and then he can please himself whether he accepts the farm at the new rent or leaves it.

21,727. It does not necessarily imply that a court should decide what is the fair rent of the farm?—Not necessarily by any means.

21,728. It merely implies, as I understand, that the tenant should obtain full value on his improvements before the rent is altered?—Yes; I believe if that was the law of the land and became the custom of the land throughout, that the other thing would right itself, and fall into working order with no difficulty.

21,729. I do not know whether you have considered the clauses in the Bill which I introduced into Parliament covering that point, which were based on certain statistics of Sir James Caird's?—I have not considered them very deeply; but I have read them through and I was very much struck with their fairness. I thought there was a great deal in them which was valuable.

21,730. I would only ask you whether it is not possible to carry out the scheme which was suggested by Sir James Caird, namely, to have a reduction of rent for a certain number of years, based on the period of the exhaustion of the improvements for which the tenant claimed compensation?—A reduction of rent for a series of years—what is that?

21,731. Instead of having a capital sum paid down by the landlord, that, in dealing with the sitting tenant, he should be able to pay him by reducing the rent claimed for a certain number of years in proportion to the period of exhaustion?—That would be simply the *status quo ante*, nothing more; the rent would not be altered you see. That is what we want. If the rent is not altered, we want nothing more than that for an improving tenant.

21,732. You would prefer a capital payment down, in fact?—No, I would not say that. If the landlord would agree to lower the rent proportionately then I would say, it is all very well, only they would have had the trouble of valuation all for nothing, because they would stand where they did.

21,733. Practically giving such power to a tenant ——?—Giving the moral power ——

21,734. Would enable him to bargain on a footing of greater equality with his landlord?—Yes, undoubtedly it would. I had missed that point for the moment.

21,735. In one of the cases you alluded to, I think there was a change of ownership, was there not?—In reference to the farm of which I gave the particulars?

21,736. Yes?—There was no change of ownership.

Compensation for disturbance.

21,737. In cases of change of ownership, and eviction in consequence of that, would you give the tenant any right to claim compensation for disturbance?—Undoubtedly.

21,738. Some cases have been brought before this Commission of tenants who have had notice to quit served upon them because of their undue use, in the view of the agents, of the Ground Game Act and other things of that kind; would you give compensation for disturbance in that case?—Undoubtedly; and very liberal compensation I should be inclined to give, if the cause of offence were simply a question of game.

Prof. J. P. Sheldon.

31 May 1894.

21,739. As regards the turning out of tenants, do they not incur a great loss in their removal, and in the forced sale of their goods and implements, and so on?—Even if an outgoing tenant received every penny that he was morally entitled to, it would still be a great loss and an inconvenience to him to move from one farm to another, beside the unpleasant frame of mind he would get into by breaking up old associations, and so on.

21,740. As a matter of fact, has that operated in your opinion as a pressure upon tenant farmers to accept less favourable terms than they were fairly entitled to?—Rather than leave the place they were so well accustomed to, and the people they knew so well, they would submit to terms which they would not submit to if they went to an entirely new farm in a fresh district.

21,741. Have you considered how you would assess compensation for disturbance; would you put it merely at the cost of removal and the loss by removal, or how would you fix it?—I do not know what I would do with regard to compensation for disturbance; I am not very anxious for compensation for pure disturbance. If you give sufficient compensation for actual improvements, I think the rest is not of very much value.

21,742. Perhaps you would consider the proposal to give compensation for disturbance as an alternative to your proposal for giving compensation to the sitting tenant?—You do not mean that you would give both compensation for unexhausted improvements and compensation for disturbance pure and simple, do you?

21,743. I want to see how you are to put the tenant on a footing of equality with the landlord. One suggestion is compensation for disturbance, and the other is compensation to the sitting tenant; and I was asking you rather which you prefer of the two?—I prefer compensation for unexhausted improvements; that is a definite thing, the other is not.

The Agricultural Holdings Act. Schedules.

21,744. Have you formed any opinion about the value of the schedules in the Agricultural Holdings Act; would you approve, in a new Agricultural Holdings Act, of adhering to the form of scheduled items, or would you prefer an Agricultural Holdings Act in which there were no schedules, but a general instruction to assess the whole value added to the holding?—I think it is well to have schedules, but I would make them cover everything. These schedules do not cover everything; as I have told you, they do not cover the rebuilding of walls.

Compensation for improvements.

21,745. You are in favour, I understand, of giving the tenant a right to carry out permanent improvements, and to obtain compensation for them if they add to the value of the holding?—Yes, of course, if they add to the value of the holding. By "adding to the value," do you mean adding to the fertility of the land?

21,746. Yes?—The re-building of walls, for example, does not do anything of that kind, but it would add to the convenience and therefore to the value of the holding.

21,747. (*Mr. Little.*) The walls would add to the letting value of the holding?—Yes, they would add to the convenience of the incoming tenant. To have good fences is a valuable thing, of course. I think it is a great hardship on tenant farmers in my part of the country, which is to a great extent a stone wall country, that there should be under the custom of the country and under the Agricultural Holdings Acts of 1875 and 1883, no recognition whatever of his claim, of his moral right, to compensation for fences which he had rebuilt. The man whose instance I gave you just now, whose rent was raised, and no reason ever given for that increase of rent, rebuilt old fences which were decrepid; miles of them.

21,748. Am I to understand that the custom of the country imposes the obligation upon the tenant of remaking them?—No, but simply repairing; if a gap falls to build it up again.

21,749. You used the words, "the custom of the country" gave no compensation for rebuilding"; is it not a correlative of that, that the custom of the country assumes it to be the tenant's duty?—The custom of the country was undoubtedly faulty, as many mediæval customs are in that respect; and the Agricultural Holdings Act is undoubtedly faulty in the same way; but I do not blame the Agricultural Holdings Act so much, because it had the example of the custom of the country in reference to walls.

21,750. (*Mr. Channing.*) You mentioned one case in which the tenant would not get compensation because he went out under the Act, and the matter for which he could be compensated would come naturally under the custom; I understand your evidence to be that you think a sound

Prof. J. P. Sheldon.
31 May 1894.

Agricultural Holdings Act ought to cover all acts of improvement?—Yes, it ought to cover all acts of improvement.

21,751. It ought to be a machinery to cover all acts of improvement?—All those acts of improvement which a tenant performs that are of value to the holding; if they are of no value I would give the tenant nothing whatever for them.

21,752. I understand that you do not think it is desirable to have custom as an alternative to the Act, because it introduces confusion into the relations of landlord and tenant?—That is so; I think if we must have an Act at all the Act should be imperative, otherwise it is hardly worth while passing it.

21,753. And should cover all possible operations and improvements?—Undoubtedly; it should be imperative and adequate. A permissive Act of Parliament seems to me to be some extent a mockery upon the people.

Dairy farming factories.

21,754. Now I will just ask you a few questions about dairy farming; I do not think you have given any evidence about that. What would you yourself recommend as the best policy for increasing the advantages of dairy farming?—There is not anything you can do now to speak of.

21,755. Do you approve of the factory system?—Yes, but then you cannot expect the Government to do that. I take you to mean that you ask what I would recommend Parliament to do to benefit dairy farmers?

21,756. What policy do you think it would be best to adopt—we are not considering here what Parliament would do?—What Parliament could do would be to improve the Act in the way I have spoken of. I believe that the spread of cheese and especially butter factories in all districts not adjacent to a railway where the milk can be sold to advantage would be a very good thing, chiefly because of the difference in the butter made in England now in the farmhouses. It may be good in certain cases, yet the butter of one farmhouse will not match with that of another in the market, and consequently the large dealers in London and elsewhere do not care to meddle with so many different samples; they would rather have a large parcel of butter which is all alike, or nearly so, such as Danish or French butter.

21,757. It has been said to me recently by a great dealer in London that the British farmer is practically out of it as regards the demand of the London market for butter?—So he is, I believe, to a great extent at all events. He has lost the best of the London trade I am afraid.

21,758. Do you see no way, by extension of the factory system and co-operation, to remedy that state of things?—Those are the only means by which the foreigners have obtained the advantage they have done. They have no advantage in climate or cattle or natural skill. I believe that our climate and herbage and cattle are superior to those of any other country. We grumble at our British climate a good deal, but I think that in those qualities we grumble at lies its excellence as a grazing country and a butter making country.

21,759. Do you see any impracticability in the British farmer regaining and keeping the control of the butter market as well as of the milk market?—I am afraid he would have great difficulty in regaining that now, because he has lost it; and it is not easy to regain what you have once lost. I believe that had he taken measures early enough, such as the foreigners—the Danes and the French—have taken, he would never have lost it, as he has done. Mind you, at the same time, it is true that the British farmer cannot produce butter enough to supply the wants of the British people, and we must take the foreign butter all the same.

21,760. You think it is impracticable then for the British farmer to supply milk to the population we have now, and at the same time to provide an adequate supply of butter?—It cannot be done. What I am sorry for chiefly in reference to this matter is that the British farmer has lost his best market for butter, and the foreigner has got it.

21,761. Still by organisation, butter making would contribute to the prosperity of the farmer?—We might regain the trade, and I daresay we should regain a good deal of it in a few years. Take, for instance, the butter factory established by Lord Vernon some years ago at Sudbury in Derbyshire. It obtained a footing early and supplied large establishments, hotels and other places, with butter of a uniform and excellent quality for which I believe they got a price which was quite 4*d*. per lb. above the average price of the farmers in the district. They keep up that trade and have no difficulty in doing so; they cannot make enough of it in fact.

Prof. J. P. Sheldon.
31 May 1894.

Increased rents and valuation of improvements.

21,762. Now just reverting to the case that you spoke of, of a man being rented on his own improvements; I do not think you stated exactly what the rents were at the several periods and what the increase of rent was?—In that specific case I gave you?

21,763. Yes?—Land had naturally gone up in value a good deal during that period I admit, and, apart from the improvement question altogether, it was worth more rent undoubtedly. But before the landlord should obtain that extra rent to which I admit he was justly entitled, let him first of all square up with the tenant and start with a clean slate.

21,764. My question was what the rents were—I do not think you gave the exact figures, did you?—I cannot give you the exact figures from memory. It was a hill country farm that I am speaking of, and the bulk of the land was what was called moorland. I believe the average rent of the farm was about 17*s*. per acre. I doubt if it is worth 17*s*. now; it may be worth that and it may be let at that. I cannot tell you the rent it is let at now to a new man. It would not be let at nearly so much as it is at all events had it not been improved 30 or 40 years ago by the man I spoke about; but for him it would not be to-day commanding the rent which it is commanding, whatever it may be.

21,765. (*Mr. Lambert.*) What is the nature of the soil in your district?—In my own immediate district—I am just over in Staffordshire—we have a heavy soil resting chiefly on clay or sandstone or on shale; it varies.

21,766. Is it mostly grass?—Chiefly grass—90 per cent. of it grass.

Rents.

21,767. Have you given much attention to the amount of rent that is paid; is the amount of rent in excess of what you consider the real value of the land now?—At the present time it is; I think there ought to be a drop in the rent.

21,768. How much do you think rents have depreciated within the last 15 or 20 years—say since 1875 or 1879?—Do you mean in actual value how much they have been dropped?

21,769. How much they have depreciated?—Do you mean to ask how much less the land is worth now than it was then?

21,770. How much farmers are paying less now than they were 15 or 20 years ago?—As I said before, there has been no general drop in rents, but there have been remissions, and I know instances,—it would be invidious to give them, of course—which have come under my notice as Chairman of the Assessment Committee, in which farmers have paid what they could on account.

Reduction of rent.

21,771. Do you mean to inform the Commission that there has been no permanent reduction of rents in your district?—There has been no general permanent reduction.

21,772. Of course I mean a general permanent reduction?—There have been permanent reductions in certain instances, but there has been no general reduction. I might say that not more than one-fourth of the farmers in my part of the country have been dropped permanently.

Rent and prices of produce.

21,773 How much do you consider that agricultural produce has dropped?—Do you mean in all kinds of produce which we sell; cheese, butter, milk, beef, bacon, sheep, and wool?

21,774. Yes; in what proportion have they been reduced?—There has been an average drop there, I should think, of 30 per cent. since 1874.

21,775. Why is it that agricultural produce having depreciated 30 per cent., rents have not been generally reduced?—I do not know. Tenant farmers somehow or other hesitate very much before they will demand that drop in the rent, and if they give notice to the landlord to leave, with the object, not of leaving, but of getting a drop in the rent, unfortunately it too commonly occurs that there is another man, a tenant farmer, who is ready to step into their shoes at the old rent.

21,776. Is there a good competition for farms?—No, there is no keen competition now.

21,777. How is it that rents are kept up to the old standard when agricultural produce has depreciated so greatly, and rents in other parts of the country have been reduced?—In my part of the country farmers were making good profits 25 years ago, and the margin on which they made those profits has disappeared, and they are just paying their way now. That is about it.

Prof. J. P. Sheldon.

31 May 1894.

21,778. Have you given much attention to the question of land tenure?—In reference to the holding of land by tenant farmers?

21,779. Yes?—I have had a great deal to do with it in one way or another.

Judicial rents.

21,780. You stated just now that you thought you would be in favour of judicial rents; have you given much attention to that subject?—No, we have had nothing of the kind brought before us, but I have given a great deal of thought to it, and read a great deal about it, of course.

21,781. Would you be in favour of it; has your thinking led you to believe that judicial rents would be desirable?—In many cases I believe they would be very desirable from the point of view of tenant farmers; in other cases not. I think many tenant farmers, perhaps, would not care to appeal to a land court for example. In a period when prices were improving through a series of years it would not be to the advantage of tenant farmers to appeal to a land court.

21,782. I think you said that you would allow the landlord, as well as the tenant farmer, to determine the tenancy?—Undoubtedly; I would give the same chance to each of them.

21,783. Therefore practically you would have no judicial fixing of rents, because if the rent did not suit the one or the other the tenant or the landlord would give the other notice to quit?—I have no objection to the system of judicial rents and land courts, none whatever; but, at the same time, I think they would not always act well.

21,784. (*Mr. Channing.*) If you had fixity of tenure and fair rents you would surely have some condition which the tenant was bound to come under or else be turned out, would you not? There is no meaning whatever in having fixity of tenure and fair rents if you leave it open to both sides to break the bargain when they please?—Of course not; but I do not think tenant farmers in England would go in for what is called fixity of tenure or even the question of fair rents, if only they had full security and were sure that they would get the full value of their improvements when they left.

21,785. (*Mr. Lambert.*) So the bulk of your observations leads you to think that judicial rents, although probably judicious, may not be altogether desirable?—Not altogether desirable.

Sale of improvements by auction.

21,786. You said that you would allow the tenants to offer the improvements they had made upon their holdings by auction?—If necessary, by auction; or by private treaty.

21,787. How do you mean "if necessary by auction?"—If they preferred that course they might take it. Some men will offer their stock by auction, others will sell them by private contract; it is a matter of taste.

21,788. Do you mean that if the improvements were offered by auction the man who bid the most would then become the tenant of the farm, irrespective of the wishes of the landlord?—No, I would give the landlord the option of being the purchaser himself instead, if he liked, at that price.

21,789. At that price?—He might take it at that price if he liked.

21,790. Supposing that the improvements were offered by auction and a man knew very well that the landlord would take them off his hands probably he would ——?—Run them up.

21,791. He might run them up, or the tenant farmer might not get the full value of them?—If they were run up with the object of punishing the landlord, the landlord could say, Well, you have offered so much for these improvements, I will accept you as the incoming tenant. He would punish the man in that way.

21,792. But presuming he were an impecunious man, and not a desirable tenant, what then?—The landlord could get rid of him by giving him notice, and then the same thing would be gone over again.

21,793. Do you think the perpetual recurrence of such a state of things as that would be desirable?—I think the word "perpetual" does not apply to it. It would not be repeated more than once.

21,794. I mean to say do you think it would be wise in your view to allow the best bidder for improvements to become the tenant of the farm?—I think as a general thing it would. There might be instances, as you suggest, in which it would not, but as a general thing I believe it would be to the advantage of the community at large that it should be so. I believe that the bidding would be *bonâ fide* in those cases, just as it is for live stock that are sold by auction.

Prof. J. P. Sheldon.

31 May 1894.

21,795. But of course you have the disadvantage attaching to that scheme that impecunious and undesirable tenants could get possession of farms; and that would not redound to the welfare of the community?—Yes, possibly there would be cases of that sort.

Letting farms by auction.

21,796. In offering these improvements by auction would it not even lead to greater competition for farms than there is now?—Landlords would be delighted if it would; what they are short of now is competitors for farms.

21,797. How is it that they manage to keep up the rents if they are short of competition?—They do not keep them up as a general thing all over England, but they happen to do so in our midland counties, where it is chiefly grass land country. It is only in the grass land country that that can be done now.

21,798. Do you think it is a desirable way of letting farms to let them by auction, to put them up to public competition? Is it not the fact that it leads farmers to bid one over another and thereby run the rent up, for the purpose of getting a holding, to an amount which they are not able to pay?—Instances are not far to seek under which farms were let by tender some years ago at all events. I do not see much difference.

21,799. But is it a desirable form of letting farms to have one farmer bidding against another?—I would not say. I do not see why landlords should object to it if in good times they were prepared, as I know some of them were, to accept the highest bidder by tender.

21,800. My point was that it is not a very desirable form of letting farms, because it tends to increase the rents; farmers bidding one against another for the purpose of getting the holding, tends to keep the land at a higher rent really than the farmers can pay. Now do you think there are any changes in the system of cropping in this country which can be carried out to relieve the present depression in agriculture?—Do you mean with regard to arable districts now?

Changes in system of farming.

21,801. Yes?—Of course in grass land we cannot alter the cropping. No doubt with regard to the various catch crops, if farmers were allowed to grow what crops they thought best for their purposes at the time and were not to be bound by any strict cropping regulations or leases or anything of that kind, that would be useful to them I think.

21,802. Do you think that, instead of producing wheat on the arable land, they could produce something else which has not depreciated in value?—I think they would have to go in a good deal more for root and green crops for the support of stock.

21,803. Only for stock and not for dairying?—I include dairying, of course.

21,804. Do you think there is a great opening for tenant farmers in the direction of dairying?—Not very great I am afraid, but there is an opening which does not exist with regard to the growth of wheat.

21,805. Do you think there is any other opening beside for farming except in *la petite culture*?—I see no opening now, except dairying and sheep and the growth of crops required for the support of these animals.

21,806. Have you studied the Danish system of butter making?—I have not been there, but I know how it is done.

21,807. Would you advise such a system being in vogue in this country?—Yes. I think it is very desirable to spread the butter factories.

21,808. Do you think anything can be done in the way of poultry farming and such like smaller means of raising money?—Yes, no doubt a little may be done in that way; but as a matter of fact farmers who have gone in for it more or less in recent years do not seem to be very fond of it; it does not pay them very well. I fancy it requires special skill to be a successful poultry farmer.

Agricultural education.

21,809. Would you advocate the greater spread of education amongst farmers?—I would advocate the greater spread of education amongst all classes if that could be; but where a man has not brains you cannot make much of him.

21,810. Have you formed any ideas as to how farmers could have improved their condition by giving them improved facilities for producing things which now do not pay them to produce?—Recommendations were issued by the Board of Agriculture some time ago about crops; it

Prof. J. P. Sheldon.
31 May 1894.

would be very useful I think to have information of that sort sent about amongst farmers and it would be calculated to do a great deal of good; also the Agricultural Returns would have a distinctly educating influence, if only the farmers would use them, but I am sorry to say that to the best of my belief farmers generally do not take the trouble to use those things.

The Agricultural Holdings Act. Section 3.

21,811. (*Mr. Little.*) I should like to ask you just one or two questions upon the Agricultural Holdings Act with a view to getting at your real ideas. You complain of the permissive character of the Act?—I do.

21,812. And you refer to Section 3 which relates to permanent improvements if I may call them so—buildings and improvements of that character—where the consent of the landlord is required; do you object to that consent being required?—No, I do not particularly object to it.

21,813. Then do you object to the opportunity being given to the landlord and the tenant to agree upon the compensation?—Yes, I object to these words: "Any "compensation payable thereunder shall be deemed to be "substituted for compensation under this Act." Any provision of this nature which enables them to make a private agreement outside the Act is calculated to be more in favour of the landlord than of the tenant, because the landlord is the stronger man and can impose his terms.

21,814. Then you would absolutely forbid an agreement on such a point?—I would have the Act sufficiently definite to require no agreement.

21,815. Suppose a tenant wants an additional building on his farm and he asks the landlord to build it and the landlord says: "No, I have not got any money; "you build it and you shall have compensation under the "Act"; the tenant says "But I would rather make an "agreement and know definitely how much I am to have "at the end of my tenancy"; would you prohibit an agreement in that case?—Yes, I would prohibit an agreement; and rather than that there should be an agreement I would prefer to have the Act say that the tenant on leaving his farm shall be paid what the building is worth at the time he quits the farm, irrespective of what it cost or when it was made.

21,816. You would not allow a tenant strong enough as he would be in that position, to insist upon terms; you would not allow him to prefer the definite compensation to the chance of compensation by arbitration?—I think it is better that he should not have that liberty. I think it is better for both sides that this thing should be properly laid down by law, and that both should know that they must abide by it.

21,817. Do you not think that the tenant would have really a greater security by a definite agreement than by a chance of arbitration?—Under a good landlord he would, but under a bad one he would not.

21,818. It does not matter as to the landlord, it is the arbitrator?—The arbitrator takes his cue from the landlord or from the agent, very often

21,819. In one case a man makes a bargain to receive a certain proportion of the cost of a building, and he is satisfied with that agreement; in the other case he leaves it to arbitration. You think that arbitration is the better method?—I think it would work better than the other thing as a general rule. There might be instances where it would not work so well, but there would be still more instances where it would work better.

21,820. Then because a tenant might be foolish enough sometimes to make an improvident agreement, you would prohibit men of business making an agreement on such a point as that?—An Act of Parliament is supposed to be an act of business.

21,821. But an Act of Parliament simply lays down the principle of compensation; it does not determine the amount of compensation, does it?—No.

21,822. Compensation by arbitration must be speculative to some extent?—Yes, but I would rather trust to that as a general rule than I would to private agreements between tenant and landlord.

21,823. Then you think it better to encourage tenants to spend money upon a speculative amount of compensation rather than upon a definite amount?—No, I should not say that, if that definite amount were always sufficiently favourable to them, but I say this: that in the bulk of cases it would not be, and therefore I would prefer the other which would be more uniform in its operation.

Section 4.

21,824. Now as to Section 4, which refers to drainage, it has a permissive character; the tenant who wants land drained can make an agreement with his landlord to drain; the landlord can drain after notice, and charge the tenant so much per cent. or the two can agree as to the compensation: what would you do there; would you say first of all that the drainage should be done without consent?—Yes, I think so.

Prof. J. P. Sheldon.
31 May 1894.

21,825. That consent should not be required; and then that the tenant should not make an agreement with the landlord as to the terms of compensation?—Yes, I should make the same reply with regard to that; because I do not think as a rule that the tenant could make a fair agreement with his landlord if the landlord were inclined to be unfair, or the agent rather—we must not talk so much about the landlord as the agent.

21,826. (*Mr. Elton.*) You told me that the landlords were so weak as hardly to be worth considering, that they were in the extremity of weakness; but I observe that you tell Mr. Little that they are so strong as to be overpowering?—I said that in reference to landlords chiefly in the arable districts of England, and I am speaking now in reference to what landlords were in the past rather than what they are in the present.

Section 5. Agreement for compensation.

21,827. (*Mr. Little.*) Then with respect to Section 5, which permits a substituted agreement for compensation for manures. Are you aware that a great many tenants infinitely prefer compensation on a definite scale under an agreement to compensation by arbitration?—There will be some perhaps—I know there are some. Unfortunately for tenant farmers you will never find them all in one mind about anything.

21,828. Would you not say that a large proportion of the most enterprising farmers in England prefer compensation in that form?—Possibly they may. Mind you, I am not objecting so much to what you are now advocating. I object to so many permissive features in this Act, which leave so many loopholes, and which are so very confusing that the tenant farmers cannot understand it.

21,829. Would you affirm that the law should step in in every contract where men meet on equal terms and are capable of making a contract; and that it should impose a fixed rule?—Not on every question by any means.

21,830. On every question between landlord and tenant?—On questions where there is not equality of standing, equality of influence, I think that the law may with beneficence step in.

21,831. You assume the inequalities?—I assume it, and I know it to have existed and to have operated in many instances in the past more than it does at present. I am speaking now more of the past than of the present.

21,832. But in the past the presumption of law was entirely in favour of the landlord?—Yes.

21,833. And the Act of 1875 did away with that presumption?—The landlords could contract entirely out of that Act if they chose; and the bulk of them did, I believe.

21,834. Did they not, a great many of them, substitute agreements giving compensation?—Agreements of their own choice and fancy they did; but they contracted out of the Act.

21,835. That is pure assumption, is it not—that it was entirely the landlords' agreement?—You may take it for granted that it is the landlords' agreement when it is he who advances it. The agreement does not emanate from the tenant, but from the landlord.

21,836. Were not these agreements in many cases drawn up after consultation by committees in which tenants were represented?—On large estates there is a printed form, which is simply filled in.

21,837. Is that printed form based entirely upon the private ideas of the landlord or of his agent?—To a very large extent it is so, of course.

21,838. Are you not aware that a Committee of the Central Chamber of Agriculture sat for some time and formulated a scheme of compensation which was incorporated into a great many estate agreements?—Yes, I believe there was something of that sort done by the Chamber some time back.

21,839. That Committee of the Central Chamber was composed of representatives of all the different classes interested—agents, landowners, and tenants—was it not?—Yes, possibly.

21,840. Then those agreements would not be drawn up entirely from the point of view of the landlord?—Not entirely so, it is to be presumed.

21,841. The point of my question is that these substituted agreements were not the mere notion of the landlord

Prof. J. P. Sheldon.

31 May 1894.

or of the agent, but in numerous cases embodied terms which had been agreed upon by a representative committee of the Central Chamber?—That is long since, I believe.

21,842. Soon after the Act of 1883?—Yes, that is only 11 years ago. I had in my mind more the period of say 25 or 30 years ago, and the operation of the law then.

Free sale of improvements.

21,843. Now with regard to the free sale of improvements, the value of the improvements must be reckoned separately from the value of the land, must it not?—I do not see that the value of the improvements would want to be reckoned at all. The improvements are simply offered and the public know what is being offered.

21,844. I will take the case that you mentioned of a gentleman who had greatly improved some grass land by using bones. He has the opportunity of offering his improvements; he offers them to a neighbour who says, "I will give you 50*l.* or 100*l.* for your improvements "on condition that I can have the farm at the same rent "as it is now," there must be some condition of that kind. Then does it not become a question of whether that 50*l.* or 100*l.* is really due to the improvements or due to an increase in the value of the farm, apart from the improvements?—It would be due to the latter in part, no doubt, in improving times.

21,845. Then it involves the question, which must be argued out, of how much of this 50*l.* or 100*l.* that the incoming tenant is prepared to give is due to improvements, and how much is due to the increase in the value of the thing apart from the improvements?—Yes; that is a delicate question of course.

21,846. But it is a practical one, is it not?—Undoubtedly, but it would operate both ways.

21,847. It is one that must be dealt with?—Yes.

21,848. And that involves the ascertainment of the value of the land apart from the improvements?—The ascertainment of the natural increase in the value of the land since the time when the rent was fixed.

21,849. Yes?—But in bad times when things have been going down as they have for the last 15 years it would work the other way.

21,850. Then in bad times you mean that a tenant could sell his improvements at a reduced rate?—Yes, he would take his chance of the times. In bad times he would get less for his improvements. If you have the one you must have the other.

21,851. Again, taking your course of putting the improvements up to auction, there must be a condition in the sale that the rent is so-and-so, the ascertained value to the landlord is so-and-so?—Yes, it would generally be the old rent.

21,852. Otherwise there is nothing to sell?—It would be the old rent.

21,853. It is the difference between the rent which the landlord charges and the present letting value?—Yes.

21,854. Then the good landlord who lets at less than the value will leave his tenant something more to sell than the bad landlord who lets at the market value?—No, I think he would leave him no more to sell.

21,855. The margin between the present rent and the letting value is the difference between the two?—True.

21,856. If the rent is high, the margin will be small, and if the rent is low the margin will be large?—True; he would not leave the out-going tenant any more to sell, but he would cause greater competition for what he had to sell, and of course that would be an advantage to the landlord, for he would be sure of a tenant, whereas he is not now-a-days.

21,857. But he would get no more money, would he?—I do not know.

21,858. The money would be put into the out-going tenant's pocket would it not?—He could not get more money ——

21,859. The purchase money would be put into the out-going tenant's pocket?—Possibly some of it; but remember there would be very much fewer out-going tenants under those conditions than there are now.

21,860. You think that if a tenant had a valuable thing to sell he would be more likely to keep it than to sell it?—He would stick to it, and his children after him.

"Inherent capabilities of the soil."

21,861. There is one other question I should like to put, and that is about the inherent capabilities of the soil—you object to that as a condition?—Yes, I do.

21,862. Is it not a condition which must be taken into account in any valuation?—Possibly.

21,863. You admitted, I think, that bones and lime upon some land would last for a great number of years, and that on other lands they would last for a very short time comparatively; is not that a case where the inherent capabilities of the soil are a factor?—I admit there is something in the inherent capabilities of the soil, but at the best it is driving a very hard bargain. Take, for instance, land which has been waterlogged for centuries, and you drain it; the inherent capabilities of the soil and sub-soil are not immediately available after that drainage; it requires a long series of years in some instances before the land—the soil, and the sub-soil—becomes sufficiently oxidized for those inherent capibilities to be realised. Therefore the man who drains that land has to wait, if he remains tenant, some years before he can lay hold of those inherent capabilities very much, and if he leaves before they have come into play, by the efflux of time so to speak, then he has been passing a lot of time during which the outlay that he has incurred in draining that land, has not been sufficiently remunerative; but it is going to be remunerative to the next man pretty soon.

21,864. Is not all this provided for by allowing the landlord and tenant to agree upon terms and compensation—is that not a thing that would be taken into account in making an agreement?—Possibly it might.

21,865. "This drainage will not take effect for some few "years, therefore I must have not only a re-payment of the "capital money, but interest while that capital remains "dormant?"—True; you are quite right in that respect.

21,866. Suppose you have pools of water on the land and you make a drain and take those pools of water off, and the land immediately becomes available for cultivation or for grass growing; then that land is changed from what was worth nothing to what is worth something; would you say that the tenant is entitled to the whole of the improved value?—No, of course not; in that case I should not say so.

21,867. Why?—Because he is quickly brought within reach, so to speak, of certain qualities of the soil which were previously out of reach.

21,868. The inherent capabilities of the soil?—Yes; what I object to is the moral effect those words have had. To my mind those words being included in the Act have been like, as it were, driving a very hard bargain, and they have had a repellent effect on the minds of tenant farmers generally. It is the moral effect on the minds of tenant farmers which those words have had to which I take objection chiefly.

Agricultural education: Dairying.

21,869. (*Mr. Gilmour.*) Has anything been done in your county or district in the direction of helping these dairy farmers to improve their butter making by the establishment of technical classes?—Yes, I am thankful to say that within recent years a great deal has begun to be done. We are doing it now on the county council. I am a member of the Staffordshire County Council—an alderman of that council in fact. We had a well qualified man, who has recently, I am sorry to say, gone to New Zealand under the Government there, going round the county giving lectures and demonstrations and having tuitional classes which have done an immense amount of good.

21,870. (*Sir Nigel Kingscote.*) Dairy classes?—In butter making but not in cheese making, we have not attempted the cheese making. Butter making lends itself with greater facility to tuitional work of that sort than cheese making does. But yet at the same time, pursuing that subject for a moment, even though the people do improve individually in the way they make their butter and produce a better article, still it does not realise its best value in the market, because each person makes a particular kind of butter and there is a great lack of uniformity.

21,871. (*Mr. Gilmour.*) Then, of course, your evidence would point to the fact that you must establish these creameries before you can improve the position in this respect?—It appears to me evident that the foreigners have gained their influence in our markets by those means, and if we are to regain our position we must adopt those means too.

21,872. Have you in this dairy work sent qualified teachers to reside on farms and practically to deal with the people and the appliances they have in their own farm-houses for the making of butter?—Yes, with regard to the butter it has been done sometimes in farm-houses, sometimes in the town halls of little market towns, where the

Prof. J. P. Sheldon.
31 May 1894.

public have been invited to attend and where demonstrations have been held, just with their own appliances? The appliances they have are good enough. It is the knowledge how to use them that is wanted.

21,873. Have you tried to do much in technical education in any other line of agriculture than in the dairy?—We have not done very much at present except a little in reference to using different kinds of artificial manures side by side on grass land to show the varying effects.

The Agricultural Holdings Act.

21,874. (*Mr. Clay.*) Referring to the Agricultural Holdings Act which you have given so much evidence upon, I understand you would like to see that Act simplified in its procedure?—Yes, simplified.

21,875. And operating at less expense?—Yes, the expense of putting it into operation is enormous in some cases, I believe.

21,876. You want to avoid the machinery of having so many arbitrators?—Yes.

21,877. And lawyers?—Yes.

21,878. You would like to see the Act worded in such a manner that in a sense those who run could read?—Yes.

21,879. And you would like to see the Act itself not overridden by any private arrangement unless that arrangement were fully in the spirit of the Act?—Fully in the spirit of the Act, and even then I should look askance at it, because it leaves a loophole, and in many cases that loophole would be taken advantage of to the detriment of the tenant I am afraid.

21,880. The Act just now says "fair and reasonable"—how would you strengthen that clause?—I do not carry in my mind the particular clause to which you make allusion; could you read the clause to me?

21,881. It is the clause which says that private arrangements must be fair and reasonable?—They must not contravene the spirit of the Act. But I think if you set off half-a-dozen men to interpret what the spirit of this Act is they would give you different answers.

21,882. How would you define an arrangement which should be equal to the Act itself?—With regard to what particular sort of improvement would that be?

21,883. The improvement that the Act allows?—I am afraid I do not quite gather the gist of your meaning.

Substituted agreements.

21,884. The second part of section 5 says: "Where in "the case of a tenancy under the contract of tenancy "beginning after the commencement of this Act, any "particular agreement in writing secures to the tenant for "any improvement mentioned in the third part of the "First Schedule hereto, and executed after the commence- "ment of this Act, fair and reasonable compensation "having regard to the circumstances existing at the time "of making such agreement"?—Do you mean what would I do in the place of that?

21,885. Yes, that is the question?—I would give a man the power to sell what was left of those improvements and let practical men bid for them, or buy them by private contract, or whatever it might be.

21,886. That would not meet the question of a private arrangement between landlord and tenant if they want to make a private agreement?—You mean it would not leave an opening for the landlord and tenant to come to an agreement about them?

21,887. Yes; if the landlord and tenant could not come to any agreement would not the law say that the arrangement which the landlord has made is not fair and reasonable?—It is extremely difficult of course to lay down anything wholly satisfactory in reference to land tenure, which is one of the most difficult questions in the world.

21,888. I want to avoid legal disputes as much as possible, and I can see that with this "fair and reasonable" there is a very open field for disputes in law. What I ask is, have you any improvement to make on those two words "fair and reasonable"?—A bargain would be a bargain. The tenant if he were leaving the farm would not be under the influence of the landlord as he would if he were remaining, and would therefore stand up for his own side all the better. Besides, no doubt he would have offers from other men who would wish to become his successors in case he had anything to dispose of.

Official referees.

21,889. Regarding the cheapening of the evidence to be got of the improvements several witnesses have suggested that an umpire should be appointed as official referee who should decide the matter under the Act, would you agree to that?—Would you please tell me in what way he would be appointed and by whom.

21,890. In Scotland he would be appointed by the sheriff; in each county there are one or two men set aside as experts whom you might call official referees?—I wanted to get to that. I should be strongly inclined in favour of capable men being appointed by the State, and paid by the county or by the State, as the case might be; that would be of course an after arrangement, to decide this question.

Prof. J. P. Sheldon.
31 May 1894.

21,891. Mr. Druce put it very well; he said a strong man in each county should be set aside for the purpose?—Or two men in big counties, or three, or even four sometimes.

21,892. But only one called in as required from the district the reference was to be made in, so that he would know the district of the county?—Yes, that is very essential, I think.

21,893. And paid by results?—I beg your pardon.

21,894. Paid by the work that he was doing; a fixed rate per day?—Yes, but that is not payment by results, that is payment by time. I thought by results you meant a per-centage on the award. An official referee is paid so much per day. He should be a capable man who knows the district. I think it is highly essential that any man presuming to value land or to value improvements, should have a personal knowledge of the land that he is dealing with.

21,895. Many men are paid by results, by per-centage, in dealing with the quantity of money put through their hands, and I do not know, if a man is awarding a thousand pounds for compensation, but what he should be paid more than if he was awarding a hundred pounds?—I do not think it would do to pay such men as these by results, because when they had little cases in hand they would be inclined to hurry them over, as being of so small importance.

21,896. Do you think it is advisable to pay them so much per day?—Yes.

21,897. (*Mr. Little.*) Is it not a fact that valuers are paid somewhat in proportion to the amount of the sum involved?—They may be in some cases.

21,898. Are you acquainted with Ryde's scales of valuer's fees?—No, I am not.

21,899. You do not know the practice at present?—I do not.

21,900. May I ask whether you would impose this official referee in all cases, or whether you would leave farmers and landowners to choose their own valuer, and only bring in the official referee as an umpire?—Of course each side would have his valuer, generally speaking.

21,901. (*Mr. Clay.*) There would be the witnesses?—The witnesses to give evidence. I think the evidence of those witnesses should be taken before this umpire, and then let him decide, and be paid so much per day.

21,902. (*Mr. Little.*) But you would have an official referee in all cases?—I think that would work well.

21,903. All cases under the Act, or all cases where crops or tillages passed from tenant to tenant without the intervention of the Agricultural Holdings Act at all?—In reference to some things no doubt the Act would be sufficiently definite to do without the services of this referee, but there would be many other cases where his services would be very useful.

21,904. I am taking the simple case where a tenant enters upon a farm, and there is no question of compensation under the Agricultural Holdings Act, but there are hay and straw and roots to be paid for; would you in such a case say that the official referee should be called in?—There is no question for the work of an umpire there, surely it is a mere question of simple valuation and measuring, that is upon the market value.

21,905. And ordinary valuers are competent for that?—Of course they are, or ought to be.

21,906. Then where in such a case you add a claim of about 20*l.* to a claim of some hundreds—20*l.* under the Agricultural Holdings Act—and all the valuers are able to agree, would you then call in the official referee to decide this simple question of 20*l.*?—That is introducing the thin end of the wedge; I should be very cautious indeed about doing that.

21,907. But is it not the case that there are hundreds of tenancies terminated where a large proportion of the sum to be paid to the out-going tenant is in respect of crops and tillages, and the compensation under the Agricultural Holdings Act is very small?—Yes, no doubt.

Prof. J. P. Sheldon.
31 May 1894.

21,908. What I want to know is whether you would in such cases compel the action of the official referee for a very small claim under the Act?—I think I would; I think I would establish the rule and let it work, and I believe it would be a good thing if it were understood that it must work.

21,909. (*Mr. Channing.*) That is consistent with your previous evidence that you wish the new Agricultural Holdings Act to cover all items?—It would include that; that would be laid down in the Act.

21,910. (*Mr. Clay.*) You have given a good deal of important evidence, and have been cross-examined upon it, about the old tenant renewing his lease?—I do not know anything about leases practically.

21,911. Renewing his yearly tenancy then?—Yes.

Increased rents and valuation of improvements.

21,912. But you have an opinion that he should not be rented upon his improvements?—There is no question of renewing his tenancy if it is a yearly tenancy, because he goes on from year to year, and there is nothing that can come in between him and the landlord except a termination of the tenancy; it is not a renewal in that case.

21,913. At the termination of the tenancy, of course, would come the compensation for improvements, if he was going out?—Yes.

21,914. With us in Scotland it would be the renewing of the lease?—Yes, of course, at the end of a given period.

21,915. Then you would like to see the tenant renewing his lease, not at the value of the farm, but at the value of the farm less the compensation for the improvements he has made?—No, I think you scarcely realise what I mean by that. There would be no question under a yearly tenancy of a renewal of the tenancy, because that would be simply a running tenancy liable to no interference, except that of termination.

21,916. Just now I am taking you upon a Scotch lease, which you know about, I presume?—I know of them, but I have had no practical acquaintance with them; I know what they mean and how they work.

21,917. Your principle that you went on was, that a tenant on taking a lease or a renewal of his tenancy should not be charged upon his improvements as rent, was it not?—Do you wish to take my mind up to Scotland now, and to leave England behind me?

21,918. Yes?—Very well. When at the end of the 21 years' lease in Scotland, for example, or a 19 years' lease, as the case may be, the landlord and tenant come to discuss the question of a new lease for another 19 years or 21 years, as the case may be, then there is a question of recompensing the tenant for the improvements which he has done to the farm during the lease which is just then coming to a conclusion; and I think the rent should not be increased at all in consequence of those improvements, but only in consequence of whatever natural increase of value in the land might have taken place.

"Limeing" land.

21,919. Through the market value rising?—Through the market value going up.

21,920. You were asked about lime; how long do you consider lime should rest upon the land as a general rule?—On grass land I believe that the effect of limeing in many cases will be seen for 30 or 40 years.

21,921. And on arable land?—On arable land it is not so easy to see, but it is still there for a very long time, though not so long a time. You can get rid of it on arable land faster than you can on grass land, but you cannot exhaust it on either.

21,922. It is not possible for you to name any practical limit, but your experience is that it does go in time?—On grass land.

21,923. On arable land?—I have had very little experience indeed, practical experience, in the liming of arable land; none to put me in a position which would entitle me to give an opinion on the point, I think.

"Boning" land.

21,924. You said you used bones. May I ask are they old-fashioned half-inch bones, or bone meal?—The old half-inch bones—raw bones.

21,925. And that is what you are meaning by resting so long on grass land?—Yes; I could show you on my own farm a grass field, part of which was boned by an uncle of mine who owned the place before me, and he died in the year 1847; I could show you any spring, just when the grass is beginning to grow, the difference between that land and the adjoining land which was not boned.

Law of distress.

21,926. I gather from your evidence that regarding the law of distraint you would like to see it abolished?—Yes, entirely abolished. I think it is a gross indignity on a very highly respectable class of men, namely the tenant farmers of this country; not only that, but it is an injustice to the tradesmen who deal with those tenants to give the landlord a preference over them for whatever a tenant may do.

Prof. J. P. Sheldon.
31 May 1894.

21,927. Is the general trader not a greater sufferer than the landlord?—The general trader in case of the insolvency of the tenant is a greater sufferer than the landlord can possibly be, because he can lose capital as well as interest, whereas the landlord only loses his interest, for the tenant cannot run away with the landlord's land.

21,928. Some people deny that the land is the capital of the landlord?—I am afraid that it is all the capital that a good many landlords have now.

21,929. It is the only capital that he has and the rent is the interest, is it not?—The rent is simply the interest on the capital; the land is the capital.

21,930. And the tradesman through the law of distress is risking both interest and capital?—If a man sells five tons of cake to a farmer he gives the farmer the control of the capital and of the profit, that is the interest for the time being, so long as it is owing for, and he may lose the whole lot.

Capital required for stocking farms.

21,931. (*Mr. Whitehead.*) In answer to a question by the Chairman as to the amount required to stock a farm in your district, I think you said it was from 7*l.* to 8*l.* per acre?—7*l.* to 10*l.*

21,932. Would that mean a dairy farm?—A mixed farm—a dairy and sheep farm.

21,933. Would that be about the average amount of capital?—I am afraid that a good many are under 7*l.* now. Of course it varies a good deal according to the price of stock. Last autumn a man might have stocked a farm for 2*l.* an acre less than he could at other times, or at a still greater advantage.

21,934. But from 7*l.* to 10*l.* is the average amount?—I should think it would be there or thereabouts.

Price of butter.

21,935. With regard to the low price of butter which you spoke of, 6*d.* a lb. I think in one district?—Yes, in the Ashbourne market it was selling at 6*d.*

21,936. That would be exceptionally low, would it not?—I fancy there was a bit of a glut or a reduced demand for the time being.

21,937. What would be the average price of butter in the district?—During how long a time?

21,938. Say for the last two years?—The average price probably would not be more than a shilling a lb. I think.

21,939. Would that in your opinion pay the producer?—If he has a cheap farm he will carry along at that price, but even then it would not pay him sufficiently for the trouble he has had.

21,940. Do you know at all what the average price of Danish butter has been in this country?—No.

21,941. I mean the price paid by the importer?—I cannot give you the figures as to that.

21,942. I have them here, in 1881–2, the price to the importer was 1*s.* 2½*d.* per lb.; in 1886–7 it had fallen to 11¼*d.*; in 1887–8 it was also 11¼*d.*; in 1888–9 it was 11½*d.*; in 1889–90 it was 11¾*d.*; and in 1890–91 it was 11½*d.*; so there is not very much difference between the price the importer pays for Danish butter and the price you say it would pay the producer in England to sell at?—I say if he has a tolerably cheap farm. I think the average price in my part of the country for butter during the past two years may be taken at 1*s.* or a little under; but for the previous three years I think 9*d.* would be quite up to the average.

21,943. Three years before the two last do you mean?—Three out of the last five.

21,944. Do you know at all what the average value generally of butter coming into this country has been?—No, I do not carry it in my mind. I frequently have occasion to read up those figures, but I do not remember them.

21,945. It might be interesting to state that in 1872 the average price of butter imported into this country was 5*l.* 5*s.* 11*d.* per cwt., and taking the last year given, 1891–92, the average price was 5*l.* 9*s.* 1*d.*, showing a certain increase in the value of imported butter?—Yes, in that period I believe the foreigners have improved the character of their butter.

21,946. I was going to ask you whether that would not be the reason for the increase?—It is a more uniform

Prof. J. P. Sheldon.

31 May 1894.

article now, not better in absolute quality perhaps, but a more uniform, saleable, desirable article than it was then.

21,947. Is that in your opinion due to the co-operative system applied to factories?—Yes, chiefly, and to increased skill in manipulation, which is chiefly owing to the association of farmers in factories.

Danish butter.

21,948. With regard to the Danish butter has uniformity of feeding anything to do with that, do you think?—No doubt it has something to do with it, especially in reference to colour.

21,949. I think in Denmark the cows are fed more uniformly than they are in this country?—Yes; and there is more care taken in winter time in the feeding.

21,950. Would it be possible in this country to get that uniformity?—I think it might. If the committee of management of any given butter factory were to stipulate that the farmers should use certain kinds of food in the winter for their dairy cows, it could be done. In Denmark that is done. Some of the committees of management stipulate that each farmer should use, say, 2 lbs. per day of rape cake to each dairy cow, and he must do it. The association provides the man with the cake and charges him with it; debits his milk account with it, and so on.

Co-operative factories.

21,951. That might be done by each committee of management of the co-operative society or factory, who would arrange food suitable for the district and the climate?—Yes, and I believe the farmers would fall into it, so soon as they saw the advantage of it.

21,952. How could co-operative factories be extended in your opinion—I do not mean by invoking Parliamentary aid, but by local effort?—In my part of the country several factories have been built by co-operation, the farmers themselves having provided the capital. In some other instances the landlord has provided the shell of the building, and the farmers have put in all the working plant, and so on.

21,953. Do you think the idea wants promulgating among farmers? Do they understand the advantages of the system, do you think?—They know about those factories, because they have been sufficiently described in the papers for many years past. A great deal depends of course upon having a leading man or two in given districts, who will initiate these things.

Marketing.

21,954. Besides want of uniformity in butter, has not the question of distribution something to do with the low prices that are obtained by English small producers?—Undoubtedly. There is a great fault in reference to distribution. The small farmers take their butter in baskets, or their wives do, to the local market towns, where the butter is bought by dealers who pass it on, perhaps, to some other dealer, who sells it to shops or to private consumers; whereas, if the butter were made in factories, the factories would pack off certain large parcels of it to a dealer in town, in London for instance, who would place it with the greatest ease and advantage amongst the retail people.

21,955. Is not the reason of the American butter and Danish butter getting a ready sale, that it is all consigned to large importers in this country, who distribute it at once to wholesale grocers, who in turn distribute it to retail grocers and other customers?—Yes, the thing works like clockwork. You can have a clockwork system where you have a large thing to deal with, but you cannot with small items like farmers' butter.

21,956. Therefore it is desirable to have co-operative factories as means of distribution as well as for the manufacture?—Undoubtedly. Take, for instance, the milk trade in connexion with cheese factories, or butter factories. I have a relation largely engaged in the milk trade who has a cheese factory. When there is a sudden glut in the milk trade, as will occur sometimes on sudden changes in the weather which affect the consumption, a wire is sent down "Keep back 20 or 30 churns to-day; we do not want it." That milk is instantly turned into either butter or cheese, and so there is no loss; whereas if there were no such arrangement and no cheese factory available for the purpose that milk would be sent up to London, perhaps go sour, and be thrown into the sewers and lost.

Railway rates.

21,957. Does not the question of insufficient means of distribution apply to a great deal of the produce of the farmers in this country?—No doubt it does, but it is a gigantic question; and then the question of railway rates is one which bears very heavily and adversely on farmers.

21,958. Is not the question of distribution one that ought to be tackled by somebody?—That would include the question of railway rates also.

21,959. Yes?—The question of distribution is one of the first importance, I think.

Prof. J. P. Sheldon.

31 May 1894.

21,960. In that respect the foreigner is in a very much better position than the home producer?—Simply because he can send out his stuff on a large scale. He can send out a uniform article in large quantities, and so it is worth the while of big men to get proper machinery and arrange to deal with these quantities, and to distribute them with the least friction and the least cost.

Price of labour.

21,961. (*Sir Nigel Kingscote.*) Has the higher price of labour in England, do you think, anything to do with the English farmers' want of profit?—I doubt whether that tells much; at all events in my part of the country it does not I think. I believe the effect of labour being a little higher paid than it used to be is that it is more efficient than it was. Then in arable districts the introduction of machinery has enabled farmers to do without a given proportion of labour which quite makes up, I think, for the difference in the cost of that labour which is still employed.

Consent of the landlord to improvements.

21,962. You have said a good deal about the tenant's improvements and in favour of his having the free sale of them; I rather want to gather from you what you call improvements—I mean beside the manurial value or the feeding stuffs brought on to the farm. Do you include buildings; would you allow the tenants to put up any buildings he liked without the landlord's consent?—Yes, I am inclined to give him that permission; I think he would not put up buildings that he did not want, and if he put up poor ones he would receive proportionately less for them if he left, because they would have less value left in them.

21,963. Suppose this case. A man takes a farm and he thinks he will breed a large number of horses and puts up a lot of wooden boxes, without asking the landlord's consent, on some of the grass land, when he goes away the landlord will not buy those boxes; how can the landlord be compensated for the loss of his grass?—The landlord would say: "Those boxes are of no earthly value to me "or to the incoming tenant, you can remove them if you "like, or you can leave them if you like, but you will "receive nothing from me for them, nor will the incoming "tenant pay you anything for them, but you have to pay "me something for the damage done to the land on which "they stand."

21,964. You would compensate the landlord?—Of course if damage is done he would be compensated. I would punish a man if he put up a lot of stupid buildings which were no good to the farm.

21,965. But you would allow him to do what he liked without the landlord's consent?—I think so.

21,966. Would you allow him to break up grass land and turn it into arable or to turn arable land into grass and as he liked?—No, I think I should draw the line at breaking up ancient pasture of good quality; but there is no inducement to do that now.

21,967. (*Mr. Channing.*) Surely you are not speaking of that as an improvement?—No, that is outside the question of improvements. I really do think that tenants who are inclined to injure a landlord's farm might in some cases break up long-established pastures which have taken a century to make what they are, and I think the law ought to prevent that. No punishment could be ample, when it was once done, and there ought to be some law to stop it and prevent it if it were attempted.

21,968. (*Sir Nigel Kingscote.*) And if the tenant chose to lay down some arable land to grass without the landlord's consent you would still think he ought to be compensated for it at the end of his tenancy?—If it is worth anything, if he has done it in a workman-like manner and used good seeds and there is a good sward, and so on, let him be paid.

Official referees.

21,969. Who is to be the arbitrator?—The man that Mr. Clay was suggesting—the paid official.

21,970. Is that not done now under the Agricultural Holdings Act?—We have no paid official as arbitrator; it is done by valuers and an umpire in some cases.

21,971. That umpire being agreed to by the two valuers the landlord's and the tenant's valuers?—Yes.

21,972. You want something beyond that?—I want something beyond that.

21,973. You want an official man?—Yes; a man who would have the Act at his fingers' end, who would be master of the Act in fact, and also a practical man at the same time. Now the bulk of the local valuers in the shires do not half understand the Act, and they go to a great extent on what they had been accustomed to before the Act was passed.

Prof. J. P. Sheldon.

31 May 1894.

21,974. Have you had any experience of valuers?—I have done some valueing.

21,975. Under the Act?—Yes, under the Act. I have taken out a license on two occasions—for one instance only—because I was requested to value on one side.

21,976. I do not want to say anything unpleasant, but you understand the Act, I conclude?—No, I do not pretend to understand it, I think I have a pretty good knowledge of it, but I do not pretend to be master of it.

Free sale of improvements.

21,977. (*Mr. Dalton.*) There is one question I do not quite understand about this sale of improvements. As I understand the man who buys the improvements is to be entitled to take the farm at the same rent as his predecessor?—Yes.

21,978. Would that not operate very injuriously to the out-going tenant when rents were falling—would he get a bid at all then?—True, but then in the practical work of life we have to take the rough with the smooth. That would be the rough. If he waited two or three years longer he might get the smooth instead.

21,979. At the present time when rents are falling it would operate very injuriously against the tenant?—Yes, and see the advantage of that—it would keep the tenant on his farm; he would say: "No, I will not go out now, I "can only do so at a great loss and I will stick on," wherewith the landlord of course would be mightily pleased.

21,980. I am not suggesting it would not be to the advantage of the landlord. What I am afraid of would be that in some of these cases if rents were falling rapidly and tenants were desirous of going out of the business you will be depriving them of anything whatever for their improvements because nobody would give anything for them?—I do not know; what can a man expect; I mean the market value of the thing.

21,981. It may be valuable to the incoming tenant and increase the value of the land; the outgoing tenant may have carried out scheduled improvements and yet under this arrangement he would get nothing whatever for them?—Neither would he under a valuation if things were becoming worse.

21,982. He would under the Agricultural Holdings Act although the rent might have fallen, yet if he has done something which has improved the farm and prevented the rent from falling further he does get the benefit there?—No one can expect Parliament to pass an Act which would give a man more than the current value of the thing.

21,983. The permanent improvements he has carried out we are supposing are possibly of considerable value, and yet although he is now entitled to be paid for them he might be quite aware of the fact if he is paying a high rent upon it that the tenant who is going to succeed him will have to pay a lower rent; if he were forced to put up his improvements for sale instead of being paid by the landlord for them he would be sure to get nothing for them; would not that be the case?—I believe the Act would not give him very much if a sale would not.

21,984. The Act gives it him irrespective of the question whether the landlord will get a lower or a higher rent than the present one; it assumes that he has done work on his farm which may make it worth a higher rent than it otherwise would command to an incoming tenant, but it does not assume that the rent will go up above what it is now; his compensation for his improvements does not depend upon the fact that the landlord will get a higher rent for the land than he is getting now?—I am not aware that there is any system of compensation under this Act which would give a man more than the current market value of improvements.

Prof. J. P. Sheldon.

31 May 1894.

21,985. No, but by saying that the man who buys it from him is to take the farm at the same rent that is being paid for it now you mix up the two things to the damage of the out-going tenant at the present time when rents are falling, but it would be to his advantage when the rents are rising; as they have been falling for many years you would be seriously injuring him at the present moment?—Yes, but then he would have the chance of staying on.

Consent of the landlord to improvements.

21,986. (*Mr. Gilmour.*) Sir Nigel Kingscote put to you the case of a landlord who objected to pay for the horses boxes which a tenant had put up, but claimed for the grass. Did I correctly understand you to say that the landlord would be entitled to say that he would pay nothing for those boxes?—Yes. He would say, They are of no use to me; you can remove them if you like, but you must make good the land on which they stand.

21,987. He would not be the deciding man on that point?—No, he would not of course; that would come before the arbitrator too, but that would be the landlord's position.

21,988. (*Mr. Channing.*) On that same point you are no doubt aware that the Scottish Chamber of Agriculture and my own Bill suggest that in the case of improvements of the nature to which Sir Nigel Kingscote has referred, the tenant should give notice of his intention to carry out certain improvements, and that then the landlord can claim a reference under the Act as to whether it is an improvement in the sense in which the holding is let?—True.

21,989. Would you not approve of that procedure?—Yes, I would.

21,990. That would give power to the landlord to check the tenant carrying out an unreasonable improvement?—True.

21,991. And at the same time it would enable the tenant to obtain compensation for a reasonable improvement?—Yes. Putting up a lot of boxes as Sir Nigel Kingscote suggested for horse breeding which the succeeding man would not require at all, would be altogether a special and extraordinary sort of thing, and therefore I think it would be only fair and reasonable that before doing such a thing he should get the consent of the landlord.

21,992. He should give notice?—He should give notice and get the consent. Failing that let him do it at his own risk.

21,993. (*Sir Nigel Kingscote.*) I thought you laid down the general proposition that the tenant could do what he liked without the consent of the landlord?—Yes, and I would still lay that down, but at the same time I should not object to an arrangement like the one which is now mentioned.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Forty-first Day.

Friday, 1st June 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

The Right Hon. Baron RENDEL.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary*.
R. F. CRAWFORD, Esq., FREEMAN THOMAS, Esq., } *Assistant Secretaries*.

Mr. G. Cooke. — 1 June 1894.

Mr. GEORGE COOKE called and examined.

21,994. (*Chairman.*) I understand that you are a tenant farmer residing at Clayley Hall, Chester, farming 278 acres?—Yes.

21,995. Whom do you hold under?—Mr. Sandbach, Cherry Hall, Malpas.

Description of farms.

21,996. What is the nature of the farm; is it a grass farm?—It is a mixed farm.

21,997. Mainly for dairying?—Principally dairying.

21,998. Is that the general character of the farms in the neighbourhood?—Yes.

21,999. What proportion of it is arable?—About 80 to 100 acres of mine, more or less—it varies.

22,000. What rent do you pay for it?—500*l.* now. Last year it was reduced.

22,001. What was it?—550*l.*

Reduction of rents.

22,002. Has there been a general reduction of rents in the neighbourhood?—Only on this estate; it has not been general elsewhere, I think.

22,003. Is it a large property?—No, it is only four good-sized farms, about 1,000 acres in all.

22,004. Were they all reduced in the same proportion—that is about 10 per cent.?—Yes, I think about the same; it would be rather more than 10 per cent. though, because previously we paid the tithe, and the tithe is now included in the rent.

Tithe.

22,005. The landlord pays the tithe now?—He pays the tithe now.

22,006. What does the tithe amount to per acre?—I daresay about half-a-crown now; it used to be 3*s.* 6*d.*; of course it is very much lower.

The letting of farms.

22,007. Are there any farms vacant in your district?—No.

22,008. When farms are vacant are there applicants for them?—Yes, there is a great deal of competition.

22,009. Are there men with capital ready to take them?—Generally. There are some with capital; many of the applicants of course I do not think have capital, but still there are always some.

22,010. It is not difficult for a landlord to find a man with capital to take the farms?—Not at all.

22,011. Is that the case generally through Cheshire?—I I think it is generally through Chesbire, it is certainly the case in our neighbourhood.

Depression in Cheshire.

22,012. Then that district has not felt the depression so much as others have?—Perhaps not so much as others; but still it has felt it very much.

Fall in prices.

22,013. What has the depression shown itself in mainly?—Of course in the reduction in prices. Milk and all dairy produce is lower, and corn, potatoes, and cattle are very much lower. Perhaps the principal item is the turn-off cattle.

22,014. When did that begin to fall?—It has been gradually coming down now for six or seven years I should think, but it has been more marked during the last three years.

22,015. Has the price of cows fallen?—Turn-off cows, that is, cows that are being sold to the butcher after having been milked, are very much reduced in price.

22,016. Are cows in milk about the same?—The ordinary dairy cattle are reduced, but not so much as the others.

Bad seasons.

22,017. I suppose your district did not feel the effect of the drought last year?—Yes, it did very much.

22,018. I thought it did not extend to there?—Yes; farther north they did not feel it so much, but we felt it very much.

22,019. Apart from that have the seasons been fairly good of late or no?—No; last year the season was dry, the year before it was very wet; we suffered very much from the wet the previous year.

The Federation of Farmers' Clubs.

22,020. Do you come here as the representative of the Farmers' Association?—As the representative of the Federation of Farmers' Clubs.

22,021. How many of the Cheshire farmers are there belonging to that association?—I could not tell you; there are three or four different associations, but I do not know how many members they have in them.

22,022. You cannot give us an idea of what proportion, what number, of the farmers belong to that Federation?—I do not think I could, but I should think about 700 perhaps.

22,023. (*Mr. Channing.*) Does it include the Chester Farmer's Club?—Yes; that is the largest of them.

22,024. (*Chairman.*) Do you mean 700 from Cheshire only?—Yes, from Cheshire only.

22,025. Have the subjects of land tenure and of the Agriculture Holdings Act been much discussed in that Federation?—Yes, the subject of land tenure has been discussed for the last two years.

22,026. I see there are about 6,200 farmers in Cheshire; you think about 700 of them belong to these associations that you speak of?—Yes I should think so, but I could not say for certain.

22,027. Have you passed any resolution on the subject of the security of tenure?—Yes, resolutions were passed, I think, two years ago on that subject, and recently too.

22,028. What were the terms of the resolutions?—I have not got the exact terms of them, but they were asking for the security of tenure, freedom of cultivation, and compensation for improvements.

Security of tenure.

22,029. What is your own opinion on the subject of security of tenure?—It is that at present it is very unsatisfactory; the effect of insecurity prevents people from making the best of their land.

Mr. G. Cooke.

1 June 1894.

22,030. What is the nature of your own tenure, is it a yearly tenancy?—It is a yearly tenancy.

22,031. Is that the general rule of the country?—Yes.

Leases.

22,032. Are the landlords against giving leases or are the tenants unwilling to take them?—I do not think that they are generally asked for, and I do not think that many of the landlords would care to give them either.

22,033. Used it to be the custom for the landlords to give leases or not?—It is not the custom now.

22,034. Was it so formerly?—I think not.

22,035. Has it always been the habit of having yearly tenancies?—As a rule.

Lord Tollemache's leases.

22,036. You say that the tenants do not ask for leases?—I think not now. There is one estate of Lord Tollemache's where leases are general, and they are very satisfactory there. Of course that is rather a special lease.

22,037. What is the nature of that lease?—It is a lease for 19 years renewable by the tenant at the end and terminable by the tenant at any time during the 19 years.

22,038. (*Mr. Channing.*) At any time?—At any time.

22,039. (*Mr. Everett.*) Binding on the landlord but not on the tenant?—Yes.

22,040. (*Mr. Channing.*) Terminable at a year's notice?—Yes.

22,041. (*Chairman.*) But that example has not been followed by other landlords in your district?—No, it has not.

22,042. (*Sir Nigel Kingscote.*) It applies chiefly to dairy farms, does it not?—They are mixed farms.

Security of tenure.

22,043. (*Chairman.*) Do you consider that the insecurity of the holding is such that there is not a sufficient inducement to the tenant to farm well?—Yes.

22,044. Have you found a difficult yourself in that way in laying out money upon your farms?—For myself I am perfectly satisfied as long as my landlord should live; but there is always this danger that something might happen and then one cannot tell what will be done in the case of his successors. I have perfect confidence in my own landlord, but I have seen cases where the landlord having died a great change has been made in that respect.

22,045. Should you say it is often the case, or generally the case, that many farmers are satisfied with their existing landlords, but are afraid of any change?—I cannot say that it is general exactly, but still a good many are, I have no doubt.

22,046. Others are afraid of the existing system?—Some are afraid of the existing owners. Of course there is this difficulty; that if they farm highly, and keep their land up in cultivation with the times, as they are doing, growing worse, and things being depressed, they are not in the same position to secure an abatement in their rent because their having improved their farms has kept the value of the farms up. They have met the times by keeping up the value of the farms.

Capricious evictions.

22,047. Have there been political difficulties or religious difficulties between landlord and tenant in your district?—Yes.

22,048. Do you consider that the tenants have been evicted on account of political difficulties?—Yes, we have no doubt about it in our own minds.

22,049. Have there been many cases, or only here and there a case?—Not very many.

22,050. Is that the case within the last few years?—Yes, it is; there have been others previously, but not to say anything then. It is just during the last two or three years especially.

22,051. The last two or three years?—More so the last year than any perhaps.

22,052. (*Mr. Channing.*) Do you refer to this in order to show that the tenant ought to have greater fixity of tenure, greater security?—Yes, that is just my point. By giving offence and having to leave he has to sacrifice so much of his improvements, if he has been farming as he ought to do, and improving his land.

Ground game.

22,053. (*Chairman.*) Then with regard to the Ground Game Act, do you consider that that is no protection to the tenant unless he has greater security of tenure?—Not without security of tenure, because although the tenant has a right under the Ground Game Act to kill hares and rabbits, yet he knows that if he did so he would get notice to quit in some cases.

22,054. What has been your own experience?—I have no complaint on any ground myself.

Mr. G. Cooke.

1 June 1894.

22,055. But you know cases where the tenant is unable to protect himself under the Act?—Yes; where it is in the agreements now that hares and rabbits specially mentioned are reserved.

22,056. Have those agreements been made since the passing of the Act?—Yes; "any Act of Parliament notwithstanding," are the words used.

22,057. Can you give us a sample of an agreement of that kind?—Yes.

22,058. What is the form of the proviso?—"All game "is reserved, including hares and rabbits, any Act of "Parliament notwithstanding." I believe those are the exact words.

22,059. (*Mr. Channing.*) Have you the exact words there?—I am only speaking from memory; I have not them in print.

Security of tenure.

22,060. (*Chairman.*) Do you consider that ordinary leases would not meet the case of insecurity?—No.

22,061. Why is that?—I may say that in such a case as this, I do not think the party would give the lease where this ground game difficulty is in existence.

22,062. But in other cases, I am referring more generally to the want of security?—No, I do not think they would meet the case, because, at the end of the lease, they are subject to a revision of rent, and about four or five years before the end of the lease the tenant feels it necessary to curtail expenditure; he ceases improving as he has done previously, in order that he may be in a better position to deal with his landlord at the end; and therefore the improvements are not going on for four of five years before the end. I have a case in my mind, within a mile of me now, where that is just the state of things.

22,063. In that case was there a lease?—It is a lease of 14 years; it is five years off the end, and the tenant has practically stopped spending money on it till he makes new terms.

22,064. Might not that difficulty be met by renewing the lease before the conclusion of the term?—That is done in some cases, but in this case the landlord is indisposed to go into the question at all until the time is up.

22,065. Then the landlord is not disposed to continue the tenant?—Yes, I think he wishes to do so, but he will not do it until the time is up.

22,066. He will not enter into negotiations until the termination of the lease?—Yes. Perhaps, just now, he may be waiting, hoping things will be better by then; I do not know what is his reason.

22,067. I suppose he thinks the present is rather a bad time for entering into a long lease?—It may be so. I do not think the tenant would renew it as a lease at all now.

22,068. The tenant would not take a lease?—I do not think he would now, as things have been going.

Restrictions in agreements.

22,069. Then with regard to freedom of cultivation, what is your opinion?—It is this; that through the restrictions which are inserted in many agreements, farmers are unable to make the best of their land. They are so tied as to the land which shall be ploughed, and the course of cropping, and what they shall do with their produce, that in many cases they cannot farm to the best advantage.

22,070. Are there many cases in your district of restrictive covenants which too closely bind the tenant farmers?—They are very general in the agreements, but they are not generally insisted on.

22,071. In fact the practice is not quite so bad as the form of the agreement?—No, but the clauses are there in case of the conclusion of the tenancy, and then these clauses are brought to bear, as they have been now in two or three cases. The case of Mr. Parker was before you. These restrictive agreements have been put in operation then when they have had to leave their farms.

22,072. What is the nature of the restrictions?—I have a lease here which contains these words, "And also yield-"ing and paying the further yearly Rent of Twenty "Pounds for every statute acre of the said demised Pre-"mises, which the said Lessee, his Executors or Admini-"strators shall plough or convert into Tillage, in any one "year more than one fifth part of the whole of the said "demised Premises, summer work and Potato ground "included, and so in proportion for any less quantity than "an acre. And also the further yearly Rent of Twenty "Pounds for every statute acre of the said demised pre-"mises which the said Lessee, his Executors or Admini-"strators, shall in any one year during this demise set

Mr. G. Cooke. 1 June 1894.

"Potatoes more than one statute acre, and so in proportion for a greater or less quantity. And also the further yearly Rent of Five Pounds for every cwt. of Hay, thrave of Straw, load of Potatoes, or cart load of Manure, or load of Sand, or Marl that shall be sold or taken from the said demised Premises during this demise, or during his occupation of any part thereof."

22,073. Is that an old form of agreement or do you think it is one of recent time?—I believe it is in existence now, and in force on the estate.

22,074. I thought you said the practice was not quite so bad as the agreement in most cases?—Not the general practice, but it is when the tenant comes to leave from any cause that these agreements come into operation so harshly.

22,075. I want to know whether these agreements are of an old type or whether they have been entered into of late years?—I believe they have been entered into of late years; of course they are on the old pattern.

22,076. (*Mr. Little.*) When you say the conditions are enforced on quitting do you mean that that fine is actually imposed, or that a claim is made?—The claim is made.

22,077. Did you ever hear of a case where the fine was enforced?—If it has not been enforced it has been put as a set off against something else.

22,078. That is enforcing it, is it not?—It is much the same.

22,079. Do you know whether any sum approaching those penal sums has been awarded to the landlord as damage?—I cannot say yet where it has been awarded.

22,080. What I want to get at is whether an arbitrator when a claim of this kind has been put before him has awarded on the principle of a penal rent or on the principle of the actual damage to the estate?—There is no doubt that those clauses have been on consideration as against something else.

22,081. (*Chairman.*) Have you known any case where a tenant has left his farm and where there have been claims and counterclaims where the arbitrator has awarded these penal damages as against the out-going tenant?—Yes, they have been treated as a set off against the outgoing tenant's claim. I do not know of any case where the tenant has had to pay the money, but where the tenant has had a claim then these claims of the landlord have been taken into consideration as against the tenant's claim.

22,082. Do you think it has been taken advantage of to the extent of charging the penal amount provided in the agreement?—I do not think it has to the full extent.

22,083. (*Mr. Channing.*) Your objection is that these clauses are used as a threat against a tenant to prevent his making fair claims for improvements, I suppose?—Yes, that is the point.

22,084. (*Chairman.*) Then with regard to the free sale of improvements, what is your view upon that question?—There is another point I should like to read from this agreement if you would allow me do so before going from it.

22,085. Yes, do?—The agreement goes on to say: "And also will and shall in the last year of this demise have and leave all the hay and straw in that year growing upon or arising from the said demised premises, which shall not be consumed by the cattle of the said lessee, his executors or administrators, in the usual place, safely secured from the weather and in good condition, and at convenient times for the use of the said lessor, his heirs or assigns, or his or their incoming tenant without any allowance or compensation for the same." A clause like that acts to prevent the tenant from producing what he might do in the last year of his tenancy. Then there is a clause with reference to obtaining the money, "Not only to satisfy and pay himself and themselves such rent and rents, sum and sums of money as shall be due and distrained for, together with the costs and expenses thereby sustained, but also to raise by means of such distress and distresses and retain in his or their hands, so much more money as shall be sufficient to satisfy the growing and increasing rent and rents, sum and sums of money that will accrue and become due during the year ending next after such distress made or such part thereof as the whole effects liable to distress will produce or amount to on sale thereof, any law usage or custom to the contrary thereof in any wise notwithstanding." It is for the year in advance—the distress for those things.

22,086. On what estate is this?—This is on the estate of Robert Howard, Broughton Hall.

22,087. (*Mr. Whitehead.*) Is it a large estate?—It is a fair sized estate. *Mr. G. Cooke.*

22,088. About what acreage?—I should think about 2,000 acres. 1 June 94.

22,089. (*Chairman.*) Now go on to the question of the improvements; do you consider that there should be conceded to a tenant the free sale of his improvements?—Yes. Free sale of improvements.

22,090. Do you consider that the Act of 1883 fails in its purpose?—Yes. It quite fails in giving a tenant compensation for the full value of his improvements. The basis of that altogether of course is according to the outlay. One tenant may judiciously spend money and make greater improvements, than another by a large expenditure will effect. A man may spend a great deal and yet it may have but very little good effect on the farm. We think neither the landlord nor the incoming tenant ought to be called upon to pay for what has been foolishly spent; but where a man by a small expenditure and by skill and care has effected a greater improvement he should be compensated accordingly.

22,091. In view of these various difficulties which you have suggested you have come to the conclusion yourself, I think, that it is expedient that land courts should be established for settling differences between landlords and tenants?—Yes. Land courts.

22,092. Do you think they should decide questions of rent?—Decidedly in cases where a landlord and tenant cannot agree.

22,093. Where they cannot agree?—Yes, but not as a general thing.

22,094. And also the question of the term for which the land is taken?—Yes, in cases where there are disagreements again.

22,095. Would you concede to the tenants perpetuity of tenure?—Yes, as long as the proper conditions were conformed to—as long as the tenant farmed his land well, paid his rent, and was of decent moral character.

22,096. Subject to the payment of rent and proper farming you consider that a tenant should not be evicted?—Yes.

22,097. Is the tenant himself to be allowed to give up the farm?—Yes.

22,098. The tenant is to be allowed to give up the farm, but the landlord is not to be allowed to get rid of the tenant?—Not without good cause.

22,099. Your proposal would practically secure to the tenant the opportunity of going away, but would not secure to the landlord the tenant?—No.

22,100. Then the land court would determine the value of the improvements where the land is taken over by the landlord?—Yes.

22,101. That is to say when the tenant gives up?—When the tenant is giving up and the landlord is taking the improvements himself with a view of re-letting them or taking them into his own hands, the land court will be brought in, provided the landlord and tenant do not agree themselves. Of course I think that in most cases the landlords and tenants would agree, and that the land courts would simply be a last resort.

22,102. But the case of the landlord taking up the land would be comparatively rare, because I understand you propose that the tenant should have a right of free sale, and, therefore, the transaction would be as a general rule between the outgoing tenant and some incoming tenant to whom he sold his interest, is that so?—Yes, I think in quite as many cases the landlord would take them himself just as he does now—I think the landlord would pay for the improvements.

22,103. If you give a right of free sale to the tenant, and if in a district such as yours there is a competition for farms, then the probability is that the tenant would in most cases, if not in all cases, sell the interest to some other tenant?—Yes, he would in most cases.

22,104. Therefore the question would not arise so much between the landlord and tenant as between the incoming tenant and the outgoing tenant?—Perhaps not so frequently. Of course in the case of an outgoing tenant and an incoming tenant as a rule they would agree, and then the land court would not be needed when they agree.

22,105. For how long a period do you consider that the rent should be determined by this land court?—I think they ought not to appeal against it within five years

22,106. Every five years you think there should be an examination of the rent?—If either party required it.

22,107. Then the same court you consider should determine what reasonable restrictions should be imposed by a landlord to prevent pasture being ploughed and so forth?—Yes, there are many cases in which tenants are precluded from ploughing land which would yield very much better crops, and the land would be very much improved by being ploughed. In our neighbourhood a great deal of land does not do well if left in permanent pasture; it is better after a few years for it to be broken up for a course of crops and then laid down again.

22,108. I suppose you consider that there should be some limitation upon the breaking up of pasture?—I do not think that a tenant should be allowed to break it up in cases where it would be objectionable to the landlord—for instance being near to his house or something of that sort.

22,109. Apart from that do you think there should be any restriction upon the right of breaking up pasture?—As to the total quantity?

22,110. Yes?—Yes. I do not think that the tenant should be allowed to break it all up by any means; and I do not think he would want to do so.

22,111. But the question you think should be relegated to a land court?—In cases were the landlord and tenant do not agree upon the matter. I have a case just now in mind of a tenant who has laid down a considerable quantity of land to grass and it is doing fairly well. He wants to plough up some old pasture which is not doing well at all and could in no way be objectionable, yet he cannot get consent, and yet according to his agreement he may break up all that is newly laid down, and he would be willing to leave that down—perhaps 30 acres—if he could break up 10 other acres.

22,112. Besides the determination of the rent for specific periods, say five years, do you think this land court in bad times should have the power of awarding a temporary abatement of rent to meet a time of depression?—They should have power to reduce the rent.

22,113. That is one of the functions which you consider the court should perform?—I do not just exactly understand what you mean by a temporary abatement.

22,114. An abatement for the year on account of a bad season?—I think that would scarcely be a matter for the court.

22,115. I am only taking it from the *précis* of your evidence before me. I only want to know what is your view upon the matter. Do you think that in the event of a bad season the land court should be able to award an abatement of rent?—No, I do not think so; not for a temporary purpose.

22,116. You do not think so?—No; any temporary abatement, I think, is a matter for the landlord entirely.

22,117. Then the rent being fixed for five years you consider that rent should be paid whatever the seasons may be?—Yes, I think it should be such a rent that the tenant can afford to stand a bad season, for he is nearly sure to get one in that time.

22,118. Do you consider that this land court should keep a record of the improvements by tenants?—Yes, I think that in case of any large improvements, or improvements of any importance there should be a record kept, and of the state of the farm when the tenant went in, so that they would know how to award compensation in the event of his leaving; they would know to what extent the improvement in the farm was due to him and to what he had done.

22,119. Do you consider that the court should also have power to enable tenants to make permanent improvements where the landlords refuse to make them?—Yes, there are many cases where tenants suffer from want of accommodation, and the landlords in some cases do not do the improvements, perhaps they are unwilling in some cases because they are unable; at any rate the improvements are not done, and the tenant cannot do justice by his land, and he cannot make the best of it for want of accommodation. I think that if the improvements would be of use to the farm and an advantage to it, and the tenant is willing to do them, the court should have power to enable him to do them, with a guarantee that he would be paid for them in the event of his leaving.

22,120. In your opinion, should the landlord have power to appeal to this court to remove tenants who are farming their land badly?—Yes, certainly.

22,121. Then it would practically be a court to take upon itself all the functions that are performed by the landlord, or nearly all?—Yes, in the event of disagreement. Of course I am always hopeful in that way that the court would have the effect that not so many of these cases would come before it.

22,122. The practical effect would be to give to the tenant a perpetuity of tenure?—Yes.

22,123. Subject only to revision of rent by this land court?—Yes.

22,124. Has the scheme been before your association?—Yes.

22,125. In its full details that you have given to us?—Perhaps not just in the detail, but still the scheme has practically been laid before them.

22,126. What has the association determined; how far does it approve of your scheme?—Do you mean by the scheme the Bill that has been introduced by Mr. William Smith?

22,127. You have given us the details of the scheme; what I want to know is how far that scheme, such as it is, has been before your association and approved in detail?—It has been discussed by the delegates to the association. Each affiliated club or association sends one delegate for each 50 members and those delegates have discussed it, and it is on the lines that they agreed upon that the Bill has actually been drawn.

22,128. Then it has been approved of by the delegates?—Yes.

22,129. Has it been laid before the association itself—the body of the members of the association?—I do not know that it has before all of them.

22,130. (*Mr. Channing.*) It has been approved, has it not, by large meetings in Chester and elsewhere?—It has been approved by large meetings.

22,131. Was it a meeting of the association, or what?—It was a meeting of the association with others invited. For instance, the last meeting was held at Wigan, and the delegates were there, and then other farmers from the district were invited to the meeting as well. Resolutions were proposed and addresses given on the subject, and then a resolution put to the meeting in favour of it and carried.

22,132. (*Mr. Chaplin.*) Do you say others in addition to farmers?—Not in addition to farmers.

Improvements by landlords.

22,133. They were meetings purely of farmers?—Purely of farmers.

22,134. (*Chairman.*) Do you consider that in a scheme of this kind the landlords would still retain inducements to spend money upon the land?—I think so. Take my own case, I do not think it would make any difference at all. The idea is this: that in the case of bad landlords it would, of course, have an effect, but in the case of good landlords it would never come into operation or have any effect at all.

22,135. The landlord would feel that he had ceased to have any real property in the land other than that on receiving the rent; he could not get rid of the tenant, he could not resume possession of it?—He could get rid of the tenant if the tenant was not doing his duty, and he ought not to want to get rid of him otherwise.

22,136. If he wants the land for his own purpose ——?—He can take it under the Bill if he wants it for his own purpose.

22,137. If he wishes to farm it himself?—If he wishes to farm it himself he can take it into his own hands or for any member of his family.

22,138. Have the tenant farmers in your district effected permanent improvements themselves or no?—Some of them have, but not to a very large extent.

22,139. Have they drained the land at all?—Many of them have put the pipes in; they have done the labour and the landlord has found the pipes.

22,140. They have not undertaken the whole expense?—Not in many cases; they have in some, few but not many.

22,141. (*Sir Nigel Kingscote.*) Is this Association that you come here to represent the same as Mr. Thomas Parker came here to represent?—Yes, he is a member of it.

22,142. A prominent member?—Yes; he is not on the committee.

22,143. If it is the same association I have not another question to ask you?—He is not on the committee, but

Mr. G. Cooke. 1 June 1894.

still he is a member of it. He is one of the delegates from the Chester Farmers' Club to the Association, but not on the committee of the Association.

Size of farms.

22,144. (*Chairman.*) What is the average size of farms in your district?—300 acres is considered a large farm; they vary from 80 acres up to 300.

22,145. What is the smallest sized farm which a man can make a living on in your district?—There are some as small as 50 acres, I think.

22,146. As a general rule is it 100?—About 100 and upwards.

Labour.

22,147. Take a man with a farm of 100 acres. What labour does he employ?—There is not so much labour upon the land now as there used to be, and as there ought to be. Farmers have curtailed expenditure in the way of labour in order to meet the times to a great extent.

22,148. What amount of labour does a man farming 100 acres employ?—He would have besides himself perhaps two or three others—one man and two youths very likely.

22,149. I suppose these small farmers work themselves?—Yes.

Restrictions in agreements.

22,150. (*Mr. Whitehead.*) I think you said that in some of the agreements tenants are restricted from planting more than half an acre of potatoes?—Yes; an acre I think it is in the agreement I quoted.

22,151. Does that restriction extend generally in your district?—No, I do not think it is general, no, it is not general.

22,152. Does it apply to the estate you were speaking of just now—the Broughton estate?—Yes, the agreement I read is the agreement upon that estate.

22,153. Did you say it was in practice?—I could not say; I do not think it is enforced as long as the tenants are stopping on their farms.

22,154. It would be brought against them if they happened to go?—Many of the points were in a case where a tenant did leave a few years back.

22,155. What is the object of the restriction?—I suppose there must be a fear of the tenant impoverishing the land. I cannot understand any other reason for it. It seems a very foolish restriction.

22,156. Do you not think it is desirable that there should be restrictions against breaking up old pasture land?—Not generally.

22,157. Not in a pasture country like Cheshire?—Even in Cheshire, I think, as I said just now, in many cases it is a great improvement to the land to break it up for a course of crops.

22,158. That is contrary to the usual idea, is it not?—No, I do not think it is—not in Cheshire.

22,159. Not if the land has been treated well?—Even if it has been treated well the grass is liable to get rough and coarse.

Capricious evictions.

22,160. (*Mr. Clay.*) I did not hear what you said regarding tenants having had notice to quit through their religious and political opinions—can you state any case?—There is the case of Mr. Parker who has been here as a witness.

22,161. (*Chairman.*) Are you of opinion that tenants in your district have been occasionally evicted on account of their religious or political opinions?—Yes.

22,162. Are you prepared to give the facts of two other cases where men have been evicted for religious reasons?—One for religious reasons, and one for semi-political reasons—advocating farmers' matters.

22,163. Are those the same two cases that have been referred to by Mr. William Smith in his evidence?—I do not know what he did refer to; I have not seen his evidence.

22,164. Mr. William Smith represents your association, I think?—Yes.

22,165. In his evidence before us he said he knew of two cases?—I think his cases were in Lancashire.

22,166. You are prepared to give evidence upon those two cases you have alluded to?—Yes.

Ground game.

22,167. (*Mr. Clay.*) Regarding the Ground Game Act, have you known tenants getting notice to quit because they intended to carry out the Ground Game Act?—Yes.

22,168. What is the remedy that you propose to meet that?—Security of tenure.

Land courts.

22,169. Through a land court?—Yes, if you like to put it in that way.

22,170. Which way would you put it?—If you give security of tenure I cannot see that the land court exactly comes in in that case.

Mr. G. Cooke. 1 June 1894.

22,171. Is the land court not to be the tribunal where all these disputes between landlord and tenant are to be referred?—Yes; it comes in in that way.

22,172. How would you appoint the members of the land court?—The suggestion that is made in the Bill is that they should be appointed by the County Council—that the County Council should select a number of names, half representing the land owners and half representing the tenant farmers, and that one of each should be called in with the county court judge as chairman or umpire.

22,173. And to it you would refer all disputes of rent and matters of the Ground Game Act, but you would not put the political element into it would you?—All cases of capricious evictions.

22,174. You would refer all to the land court?—Yes.

Restrictions in agreements.

22,175. Regarding the ploughing up of old grass, do you think it would be prudent to allow the tenant to deal with old grass as he thinks best for his own advantage?—As a rule.

22,176. Do you not think the landlord has something to say in that matter?—In some cases he may, in some districts it all depends upon the land.

22,177. As a rule just now when arable land is paying badly, is it not an advantage to have more grass?—Yes, it is as long as the grass land is doing well, but in cases where pasture gets rough and stock will not eat it, well then it is of advantage to plough it for a course of crops and lay it down again.

22,178. Have you found landlords unreasonable when you put it fairly before them?—Yes.

22,179. They would not allow a farm of that kind to be ploughed up in order to improve it?—Strictly prohibited it.

22,180. Is that in Cheshire?—Yes.

22,181. Does a tenant sometimes not go to plough up old grass for the personal advantage of getting a few extra crops off it in order to realise more money?—He may do so in some cases, but I do not think that is the rule.

22,182. You know old grass is not so easily made if it is once ploughed up?—It takes root in Cheshire pretty well.

22,183. How many years does it take to make old grass in Cheshire?—We get good pastures in three or four years; in fact, even the first and second year we get them so much earlier that I question whether they are not quite as good.

22,184. So you yourself do not see any disadvantage in tenants ploughing up old grass?—No.

22,185. From the tenant's point of view?—Not from the tenant's point of view nor from the landlord's either.

22,186. (*Mr. Little.*) You say this form of agreement is still enforced upon the Broughton Estate?—I believe so. I have a letter in my pocket from a man close to, saying he believes it to be so still; I wrote and asked him.

22,187. Do you happen to know whether a tenant when he enters pays for the hay and straw; the tenant going out is not to be paid anything for the hay and straw left upon the farm, does the incoming tenant pay anything for them?—When he comes in?

22,188. Yes?—Not in a case like that.

22,189. Then if the tenant at his entry has not to put down the capital sum for hay and straw, if he leaves hay and straw at the end of the tenancy he is not injured if he only leaves the same quantity?—If he leaves the same quantity, but in many cases it is not so.

22,190. But the principle, I suppose, is that he quits as he enters?—Yes, that is the principle.

22,191. And the only injustice which can arise is from there being an increased quantity or an increased value?—Yes. If he has been an improving tenant there is likely to be an increased quantity; that is my point.

22,192. The principle is not unfair that as a man enters so he shall quit?—It may be not unfair, but still it is not an encouragement.

22,193. I am not saying that it is judicious, but there is some reason in it where land is not improved at all and the produce is the same; if a man enters and finds manure and hay and straw, it is not unfair that he should leave them when he quits?—That is so.

22,194. Do you suppose there are many tenants who at the present day would sign such an agreement as this, binding them not to sell any hay, or potatoes, or roots, or straw?—Yes, I think there are many that do now.

22,195. Do you think that any alteration of the law could protect men who would sign and enter into such an agreement?—The law would be made binding I take it.

Land courts.

22,196. (*Mr. Dalton.*) How soon after a contract for a tenancy has been entered into do you think the land court should revise the rents?—Every five years I said just now.

22,197. But I mean from the commencement of a tenancy. If two people come to an agreement as to rent and so forth, do you think that agreement should remain in force for five years?—Yes I think so.

22,198. You propose that the land court should have power to reduce the rents in time of depression. Is it also to have power to raise them at other times?—Yes.

22,199. (*Chairman.*) I thought from your evidence that you did not mean that the court should have power to reduce in time of depression, but that the rent fixed for the five years should be conclusive during those five years?—Yes; and that there should not be temporary abatements or yearly abatements on the amount; I do not approve of those.

22,200. (*Mr. Dalton.*) But you would give the court power to raise it as well as to reduce it at the end of the five years?—Yes, I would treat each party alike.

Free sale of improvements.

22,201. With regard to the free sale of improvements. Is that to be in substitution of the existing arrangement? Supposing no one wishes to buy the improvements is the landlord to be liable to pay for them?—Yes, the landlord would take them.

22,202. Supposing that the landlord does not, you propose that the tenant should have power to sell his improvements?—Yes.

22,203. And the landlord may come in and buy them; but supposing no one else outside is willing to give anything for the improvements, is the tenant in that case to have any claim as against the landlord?—Yes, he would have a claim for the improvements.

22,204. Then the sale is not intended in substitution for the present arrangement?—In cases where it is not entered into it would be.

22,205. If no one outside is willing to give it, still the landlord is to pay?—Yes.

22,206. (*Chairman.*) Of course there would be the strong *primâ facie* evidence that the improvements were of no value if nobody was prepared to give anything for them?—Yes, or that the farm was too dear, it would be either one or the other.

22,207. Then the land court has got the power of reducing the rent if the rent was too high?—But it might not within the period of the five years.

22,208. So that the landlord is to be made liable, though in the market the tenant could get no money for it?—Yes.

22,209. The landlord is to remain liable under the Agricultural Holdings Act?—Yes, he would remain as he is now.

22,210. (*Mr. Dalton.*) Supposing some one had bought the improvements, would the landlord still have any claim for dilapidations?—Yes.

22,211. The landlord I mean may consider that so far from there being any improvements for him to pay for, there are dilapidations for which he ought to receive compensation; does the incoming tenant who buys the improvements take the farm liable to that?—Yes.

22,212. Does that get rid of the landlord's claim for dilapidations?—No, he would buy that as well; I should say it would all be part of the bargain; he would take the whole thing. If he got the good will from the tenant he would take with it all the responsibility.

22,213. (*Mr. Channing.*) I do not think you quite understood the questions that have just been put to you; I suppose your view is this, that where there is no purchaser for the improvements the ordinary relation of landlord and tenant under the Agricultural Holdings Act subsists, and what is due to the tenant and what is due to the landlord will be determined in the ordinary way by valuation?—Yes.

22,214. Perhaps you are aware that free sale and compensation by valuation were always treated by Mr. James Howard and others as alternatives in that case?—Yes.

22,215. That where improvements were not sold there should be the ordinary system of valuation?—Yes.

Mr. G. Cooke. 1 June 1894.

22,216. Do you take that view also?—Yes, I take that view.

22,217. Of course the landlord would have the same opportunity of obtaining dilapidations as he has under the Agricultural Holdings Act?—Just the same.

Restriction of rents.

22,218. Now may I ask exactly what you mean by a fair reduction of rent in times of depression; do I understand that your meaning is this: that you do not think that a tenant in the present state of the law is in a position to obtain an adequate reduction of the rent in depressed times without the intervention of the landlord?—That is my point. Perhaps I might read my own note of my evidence. My note is, "As to a fair reduction of rent to the "improving sitting tenant in times of depression—that is in "the case of the man who has kept his farm up to a fair "standard of cultivation the court should have power to "come in."

22,219. (*Chairman.*) Do you mean at any interval between the five years?—No, at the end of the five years.

22,220. At the end of the five years?—Yes, when he appealed to the court.

22,221. (*Mr. Channing.*) You mean that a tenant at present, supposing this Bill were passed, would be in a position to go to the land court and get the rent fixed for the five years?—Yes.

22,222. Is it your contention that the tenant is in too weak a position to obtain a satisfactory bargain?—Yes.

22,223. That is your contention, that the state of the law is not sufficient to place him on an equal footing?—Yes.

22,224. And that is rather aggravated, I understand, by the great competition which there seems to be for farms in your neighbourhood?—That is just the point. The competition is, of course, in this way; that farming was pretty good about 20 years ago, and farmers have brought their sons up to farming, and the consequence is there are a great many more wanting farms than there are farms vacant, and they are not inclined to go to other counties. Therefore we have this very great competition in Cheshire for farms.

22,225. Then an improving tenant who wishes to remain on his holding in these bad times owing to there being other men ready to take the farm is not able to obtain a reduction which is adequate?—That is so

22,226. Do you think that many men are now paying rents which the products of the farm will not justify?—A great many.

22,227. Have the rents in the case of the new tenants been considerably reduced?—They have in a number of cases.

22,228. While in the case of the old tenants they have remained without the same fair reduction?—Yes. Perhaps I ought to explain that. In many cases, of course, the old tenant has let the farm go down to some extent before he has left it, and then in order to get a new tenant there has had to be a reduction in rent. I could give you the case of two adjoining farms that I know very well. When the tenant of one left about eight years ago the new tenant got a reduction of rent, and he also got a considerable sum of money spent in improvements. He was on the farm about six years. He has now left and another tenant has got a reduction again and 450*l.* spent in improvements. On the adjoining farm, where the man has been improving all the while, he cannot get a reduction at all.

22,229. Do you think that is a bad policy on the part of the landlord?—It is a bad policy on the part of the landlord, I think. It is against his own interest.

22,230. Then in addition to the competition there is also the loss by removal, the loss of goodwill, and other advantages which a sitting tenant would lose if he gave notice to quit in order to obtain a reduction?—Yes.

22,231. He has to consider all those things?—He has to consider all that. There is a case of a man on one of the largest estates and best estates in Cheshire, who asked for a reduction a while ago. He was unable to get it, and he has had to leave and go into Warwickshire. A new tenant has taken it at 6*s.* an acre less. The old tenant would have been very glad to have stayed on at the money.

22,232. You think that if under these circumstances a sitting tenant could obtain, in times of depression, an adequate reduction, it would be beneficial to agriculture,

Mr. G. Cooke. 1 June 1894.

and to the owners of land as well as to the tenants?—I think so.

Compensation for disturbance.

22,233. In view of these losses by removal, what view would you take of compensation for disturbance as an alternative to the land court? Do you think that would meet the difficulty—that where the tenant was evicted unjustly or capriciously, he had the right to claim additional compensation because of that disturbance, in addition to his compensation for improvements?—Of course that would be better than it is now, but I think the other is the better system.

22,234. The other would be the better system?—In going to a fresh farm of course he has to encounter different things besides his actual loss.

Lord Tollemache's leases.

22,235. You gave us a very clear account of what you want in the way of a sort of permanent tenure with the right of the tenant to give notice if he chose, and the right of renewal from time to time at the end of these fixed rent periods, but practically your proposal is pretty much the legalising of Lord Tollemache's lease, is it not?—Yes.

22,236. You think that is the type of what a good landlord has been willing to do in your neighbourhood?—Yes.

22,237. And you think it would be no harm to have that made the law of the land?—I think not.

22,238. (*Chairman.*) Is not there this great difference between your proposal and Lord Tollemache's—that your proposal would give the tenant perpetuity of security, whereas Lord Tollemache's lease is only a lease for 19 years?—It is renewable by the tenant.

22,239. At the end of the 19 years?—Yes.

22,240. For ever?—Yes.

22,241. Are you quite certain about that?—Yes.

22,242. (*Mr. Dalton.*) It is renewable for another period but not for ever and ever?—It has never come to that; it has only been in existence a few years.

22,243. (*Mr. Channing.*) The rent is fixed between them by agreement in that case I understand?—The rent is fixed by agreement. I believe Lord Tollemache in giving the lease said that he wanted to secure the tenants against any one who might succeed him.

Restrictions in agreements.

22,244. You took exception to these restrictive covenants and you were asked a question as to the enforcing of the penal rents—whether valuers did not as a rule enforce the penal rents; do you think that that is a sufficient defence to the existence of these penal rents?—I do not think it is.

22,245. If they are not enforced in the Courts they are presumably unjust and unreasonable with regard to agriculture?—Yes.

22,246. With regard to a tenant going out as he came in, would you think that he would meet questions of manure and what is left, and so on, by agreeing to supply the manurial equivalent of all that he sold off the farm in the way of hay and straw and so on?—Yes. Of course if the letting value was the principle that was acted upon that would settle the matter.

Capricious evictions.

22,247. Now you have referred to cases (I will not go into them) in which tenant farmers have been evicted for capricious reasons. Are you aware that the 41st section of the Agricultural Holdings Act requires the landlord in certain cases to give on the notice to quit a statement of the reasons for which he is resuming possession of the holding?—No, I was not aware of that.

22,248. Do you think it would be satisfactory in order to check capricious eviction to require that a statement of the cause of the notice to quit should be put upon the notice?—I do not think it would because there might be other reasons given perhaps in some cases; the whole reasons might not be given.

22,249. The suggestion has just been made to me from Lancashire but you do not approve of it?—No I think not; the full reasons might not be given.

Railway rates.

22,250. I do not think you said anything in your evidence-in-chief about railway rates. Have you any evidence to give us about that? Will you state for instance what objection you have to make with regard to the milk traffic?—We think that the rate for the carriage of milk is too high according to the value of the milk and according to the labour which the railway companies have with it. We have been agitating for some years for a reduction in the rate for the carriage of milk and we had hopes that we should have got a reduction but it is left just as it was before. The rate for the carriage of new milk is over 13 per cent. of its actual value taking the year round, and the rate for the carriage of skim milk, which is sent largely away to be used as butter milk, is over 33 per cent. of its value.

Mr. G. Cooke. 1 June 1894.

22,251. Did you attend the Agricultural Conference in St. James' Hall?—Yes.

22,252. As representative of some of the Cheshire associations?—Of the Cheshire Farmers' Club and the Chamber of Agriculture.

22,253. There were a number of delegates there from Cheshire were there not?—Yes, there were five or six.

22,254. There was a very strong feeling with regard to the necessity for action, was there not?—Yes, a very strong feeling.

Tenure.

22,255. Did you approve of the resolutions passed at that conference with regard to land tenure?—I approved of the one that was not passed—the one that was stronger.

22,256. (*Chairman.*) You did not carry the day?—No, we did not carry the day.

22,257. How many hands were held up for you?—There were many hands held up—I think they were not counted—I could not tell.

22,258. Still not a majority?—Not a majority decidedly, else we should have carried it.

22,259. A small minority?—Not very small.

22,260. (*Mr. Channing.*) As a matter of fact there is a very strong feeling in Cheshire among intelligent agriculturists, such as you represent, in favour of changes in the law of land tenure?—Yes, a strong feeling.

Large and small estates in Cheshire.

22,261. (*Captain Owen-Thomas.*) Are you a tenant on a large or on a small estate in Cheshire?—It is about 1,000 acres; it is a small estate rather.

22,262. Is there much land owned in Cheshire by small landowners?—It is principally owned by large landowners.

22,263. Would you say that tenants on large estates are better treated than tenants on small estates?—I do not think so. I do not think any are better treated than we are.

22,264. Are you satisfied with a remission of 10 per cent.?—Yes, I am satisfied.

22,265. Is that all you applied for?—That is all I asked for.

Competition for farms.

22,266. (*Mr. Chaplin.*) I understand there is great competition in your county for farms?—Yes.

22,267. Is that because the race of Cheshire farmers, and the young men in particular, do not like leaving the county?—To a great extent.

22,268. It is because of this competition you propose that the court is to fix the rent?—Yes.

22,269. You are aware, of course, that in other parts of the country there is no competition?—I have heard it.

22,270. And that farms can be got without much difficulty?—Yes.

22,271. Then because the Cheshire farmers that you represent do not like leaving their county, you think the landlords should be called upon to take rents which are fixed by some outside court instead of by the ordinary way of agreement between the two parties?—In cases where they are too high, of course.

Free sale of improvements.

22,272. I want to ask one question about Mr. Smith's Bill which I did not quite understand. I think you said that the landlord could always resume possession of a farm for his own purposes or for the purposes of any one of his family?—Yes.

22,273. What becomes of the sale of the improvements then?—He would then pay the tenant his compensation.

22,274. The landlord would have to buy the improvements?—He would have to buy the improvements.

22,275. And I suppose he would have to buy them against other competitors; how are the improvements to be sold?—If he had to go against other competitors and he was not satisfied with the price that was offered by other competitors, he would call in the land court then to settle it.

22,276. He would call in the land court?—Yes.

22,277. I thought one of the conditions of the Bill was free sale of improvements?—Yes.

Mr. G. Cooke. 1 June 1894.

22,278. That is to say that the tenant who is going to give up a farm has the right of selling his improvements for the best price he can get, is that so?—Yes.

22,279. Does he sell them by auction?—That is not contemplated, I think.

22,280. Might he sell them by auction?—Yes.

22,281. At all events he may sell them to the highest bidder?—He may sell them to the highest bidder.

22,282. Then the landlord can only buy them by outbidding the highest bidder?—Yes.

22,283. That is quite so, is it not?—Yes.

22,284. Do I understand you that in all cases the tenant going out is to have the right of selling his improvements?—Yes, the right of selling them.

22,285. In all cases?—Not in a case like that where the landlord took it for his own purposes.

22,286. Where the landlord takes them for his own purposes, the tenant is not to have the right of free sale?—Not to anyone else—only to the landlord in that case—he could not.

22,287. If I understand the Bill aright, a landlord could always resume possession of the land for himself?—Yes, for himself.

22,288. If he resume possession for himself the right of free sale goes?—Yes.

22,289. And then the tenant can only claim under the Agricultural Holdings Act?—That is so.

22,290. So consequently Mr. Smith's Bill can always be set aside by the landlord coming forward and saying that he wants the land for himself?—Yes, he is obliged to retain possession.

22,291. What?—He must retain possession of it himself for, I believe, seven years and if he does not retain possession that long the tenant is to have the first right to enter in again.

22,292. (*Mr. Little.*) And then is the tenant to repay to the landlord the cost of the value of the improvements?—If he can prove it, certainly.

22,293. And suppose it deteriorated, is there not a provision in the Bill that if the landlord lets the land run down he has to compensate the tenant that has gone out?—I think not.

22,294. Yes, positively, is there not?—I could not just say.

22,295. Is there not a proviso in the Bill that if the landlord who has taken the land into his possession afterwards gives it up to the tenant who had previously gone out he has to compensate him if he does not leave it in as good a state as it was—I put that to you; is that not in the 5th Clause, Sub-section 3 of the Bill?—(*After looking at the Bill.*) Yes, it is so.

Mr. G. Cocke. 1 June 1894.

22,296. (*Chairman.*) Do you consider that this proposal that you have made should be applied to every case of tenancy now existing?—That they should be allowed to go to the land court do you mean?

Perpetuity of tenure.

22,297. And that perpetuity of tenure should be conceded to every tenant now in possession?—Yes.

22,298. Every tenant?—Yes.

22,299. Supposing a tenant has been in possession of his farm for one year from the time of the passing of the Act do you consider that he should be entitled from the mere fact of his being in possession to a perpetuity for ever, because he happens at that moment to be in possession of the land?—I think so if he complies with the conditions. Of course the conditions are pretty strict.

22,300. I assume that he complies with the conditions but you are conferring the enormous benefit of granting perpetuity to a man who has only come into possession of a farm a year before?—Yes.

22,301. Or perhaps even six months or three months before?—I presume the landlord would not have let the farm to the man unless he had confidence in him as a tenant.

22,302. The moment a man has come in he is to be entitled to perpetuity for ever?—Yes.

22,303. Although he came in only a year before on an agreement to remain there a year?—Yes. Of course farming from year to year a man could not possibly farm it to do any good to himself.

22,304. Have you drawn the analogy of your case from the proposal in the Irish case?—No, I do not think I have ever read the Irish Bill.

22,305. You do not know what happened in Ireland?—I have only read it of course in the papers.

22,306. Have you not taken judicial rents and fixity of tenure from the Irish case?—We have taken it from the Bill prepared by Mr. Ellis for Wales to a great extent.

22,307. Was not that taken from the Irish case?—I do not know where he got it, but his Bill was the basis we acted upon. What he went upon I cannot say.

22,308. Have the tenant farmers of your association adopted the scheme from the experience of the Irish legislation?—I do not think so. I do not think that the Irish case has really been considered in the matter. It has been looked at simply from our point of view.

The witness withdrew.

Mr. H. W. Wolff.

Mr. Henry William Wolff called and examined.

Mr. H. W. Wolff.

22,309. (*Chairman.*) You are the representative of the Agricultural Banks Association I believe?—I think the Secretary has put that in to give me a status; but I hold no brief from them; I happen to be a member of their committee, but I am not sent here for them.

22,310. Do you represent their views?—I do not know what their views are. They have adopted my views, so far as one particular type of bank is concerned; but what their views are with regard to other matters I do not know yet.

Agricultural banks.

22,311. You have come here to explain a system of agricultural banks which is now adopted in many parts of the Continent, have you not?—Yes.

22,312. I think that system was started in Germany in 1849?—There were two different systems started in 1849. The one that I shall refer to later on is specifically agricultural: the other is general, and claims to have done some good to agriculture, but it has not done very much.

22,313. The principal system which you speak of was started in Germany in 1849?—Yes.

22,314. And has now been extended throughout Germany, Austria, Hungary, the Polish Provinces, Italy, and Belgium, and is also much on the increase in France?—Yes.

22,315. Will you explain exactly the process what is meant by these agricultural banks?—The system I have come to speak about is the one type that I consider particularly applicable to the poorer cultivators, and I fancy it may be made serviceable for our allotment holders, and small occupiers. The object is to find some substitute for the usual security—to give some guarantee to the lender—and that is done by combination, and by checking the members. It is only applicable in small districts where people know one another, and where there is constant contact between them. The security that they give is, in the first place, their joint liability, which is either unlimited, or else it may be limited to a multiple of the shares taken (but it is not really dependent upon shares, and there are banks based upon liability altogether without shares), and, in the second place, the checking of the employment of the loan. In small districts the people all know one another; they know all about one another's doings; and it is in their interest that the thing should not go wrong. Where the district is small, and where the people can watch one another, there it has been found very safe; and in point of fact in Germany since 1849, in one federation, though it numbers now about 1,300 associations, not a penny has been lost.

Raiffeisen Bank in Germany.

22,316. 1,300 banks, do you mean?—There are about 1,300 in Germany of this one federation of the Raiffeisen Union. At the new year there were 1,250.

22,317. (*Mr. Little.*) Would you call them branches of one bank, or separate banks?—Separate banks. They must all be separate; they are limited each to one locality. They can form a central association, and a central bank; but the basis is the local bank.

22,318. (*Mr. Whitehead.*) Only that the central bank must be on the same principle, I take it?—The central bank is a joint stock bank with limited liability.

22,319. (*Chairman.*) Are they all established under some special law?—There is a new law, passed in 1889, which applies to them as to all other co-operative associations, but it does not specially apply to them.

Mr. H. W. Wolff.
1 June 1894.

22,320. Are they established for the purpose of lending money?—They are established for the purpose partly of taking savings, but mainly of lending money for productive purposes, to members only.

22,321. Are they worked for commercial purposes?—No.

22,322. What are they then—are they a kind of voluntary association?—They are voluntary associations of rich and poor both joining together; there are no profits, and all services excepting the cashier's and secretary's—that is one person, who generally draws a very small stipend—are strictly gratuitous.

22,323. How do they raise their capital?—They raise their capital by loan. In the first instance there is often some difficulty, but once they have got established they raise money easily. In Germany they raise it from the Imperial Bank, which corresponds there to the Bank of England here; in Italy they raise it from the savings banks and from other banks, and also from private persons.

22,324. Are there shareholders?—In Germany under the law of 1889 they are bound to have shares, and they have got very small shares of about 10*s.* to 12*s.* each. In Austria they have got rather larger shares—about double that amount. In France there were 56 banks a few weeks ago and they have no shares; but then they have not been started very long. In Italy they have been going on since 1883, and there is only one bank which, to meet the views of a local judge, has issued penny shares—all the others are without shares.

Security for capital borrowed.

22,325. On what security do they raise money?—Simply on the security of their joint liability. One man acts practically as surety for the other. Supposing 30 men join, the 30 men pledge themselves with unlimited liability to the lender; then they secure themselves by checking the borrower. They may limit by special vote the amount to be lent out in all, and the amount which is to be lent out to each borrower; and they are exceedingly strict in their claims for the interest and for the repayment of capital.

Constitution of Raiffeisen banks.

22,326. What is generally the average number of persons belonging to one of these banks?—I am afraid I could not say. In one I found a members' roll of 250—that is rather a large one. In Italy they are very small; they have some of 20 or 30 members and as few as 13 have started one, but that is an exceptionally small number.

22,327. Suppose 30 persons associated themselves together for the purpose of founding one of these institutions, are those 30 as a rule men of means and capital?—There are generally some men of means among them. It is not strictly necessary, but the leaders of the movement strongly recommend that there should always be some men of means; and those are generally the men who have the most experience of business, and it is an unwritten rule that they should be in a majority on the governing bodies, in order to protect themselves and also to assist the local bank.

22,328. Then supposing these 30 persons have started, they borrow money upon their joint responsibility?—Yes.

22,329. Do they lend it to the poorer members of their association or to other persons?—No; only to members.

22,330. Only to members?—Yes, that is one of the guarantees. They are very strict in the selection of members; and that is where the educational value of the system comes in.

22,331. Is there any limitation on the amount that they can lend?—That is according to the rules of the local bank. The local bank may fix a limit. One small Italian bank began by fixing it at 1,600 lire which it subsequently increased to 2,000 or 3,000. In Germany I do not think they have got any limit.

22,332. What rate of interest do they borrow at?—At the lowest that they can get; they generally manage to get it low. In Germany they raise some from the Imperial Bank at 3½ per cent.

22,333. What do they lend at?—They lend at never more than 5 per cent. in Germany; in Italy at 6 per cent. and in the mountain districts at 8 per cent., but in Germany never over 5 per cent.

22,334. Then they make a certain profit between 3½ per cent. and 5 per cent., that is between what they borrow at and what they loan at?—Yes.

22,335. That, I suppose, is absorbed in their expenses?—A part of it in their expenses, but an important feature of the whole system is a reserve which goes on accumulating. All surplus goes to this reserve, which is never to be shared out, not even in the case of the society being dissolved, it belongs to nobody individually and nobody has a claim against it, excepting the bank collectively. Some of the reserve funds so accumulated are very considerable in Germany. I have found some of 1,500*l.* and there are some of 2,000*l.* In Italy they are very much smaller because the banks have been going on for a shorter time and their transactions are not so large.

Mr. H. W. Wolff.
1 June 1894.

Security for loans.

22,336. On what security do they lend their money?—Mainly on personal security.

22,337. Personal security?—Personal security is really the rule. They might take a mortgage where a man has one to give as additional security. In Germany the security is a note of hand generally with two sureties; in Italy they also want two sureties, and they always take a bill of exchange.

Origin of Raiffeisen banks.

22,338. Do you think that these institutions have grown up in consequence of the absence of country banks in these districts?—No; they have grown up nearly everywhere in consequence of the prevalence of usury. Usury was very rampant in Germany up to 1848. The Jews were deliberately kept out of the large towns; a German Minister of State has explained that to me. The law was so adverse to them that they could not carry on any commercial transaction, generally speaking, except under an assumed name—under the name of somebody else who practically lent them their name. So they were all driven into the country and from Belgium downward to the Swiss frontier, and in Lorraine also, the small trading Jews settled in the villages and took hold of all the business there, and carried on usury to an extraordinary extent.

22,339. Were these associations started in order to free the small cultivators from the hands of these Jews?—That was the main object.

22,340. Was it not also the fact that there was an absence in those districts of country banks?—No doubt.

22,341. The Jews had come there in consequence, or perhaps supplied the want, though at usurious prices, which would be supplied in this country or in Scotland by banks. I presume?—Yes, but the banking system was very little developed in Germany at that time. I speak of "Jews," but I should say there were a good many Christians among them.

22,342. There are very few local country banks in those districts, are there not?—Very few.

22,343. These associations are bodies for mutual assistance in the way of loan to supply the place of these banks and to free the small cultivators from the hands of the Jews?—Really when the first bank was started—that was in 1849—there had been great distress mainly in the years 1847 and 1848. The founder of that system was then Maire, under the French law that means mayor of a district of 25 to 30 parishes. He found that everything that the people had was pledged to the Jews, and the people were in a very wretched state. Their cattle was lent by dealers and was pledged to them, and there was great abuse practised in connexion with that trade. All their little buildings were mortgaged and really they did not know what was going to become of them. Then this man Raiffeisen took the question up. He began by starting a co-operative bakery. He sold the bread to members at half-price. Then he started a co-operative cattle purchase association which did some good. Then he went a step further and started this loan bank which was to provide people with money for productive uses only.

Raiffeisen banks and co-operation

22,344. Have these banks led to co-operation, or has co-operation led to the banks, which movement has preceded the other?—I think that is the form that co-operation took at that time in Germany; it was quite unknown till then. About the same time Schutze Delitzsch in Eastern Germany, and Raiffeisen in Western Germany, started it in this way. This is the peculiar form that co-operation took in that country. Supply co-operation is most developed here; productive co-operation most in France, and credit co-operation most in Germany.

22,345. Has it been accompanied or succeeded or preceded by co-operative societies for the purpose of buying manures, implements, feeding stuffs, and so forth?—Succeeded. Agricultural co-operative supply was unknown till these banks became fairly prosperous. I remember more than 20 years ago, when our Agricultural and Horticultural Associations had begun to work properly, I wrote letters to the agricultural paper issued by the Agricultural Ministry of Berlin, suggesting co-operation, but there was none at that time; and now, last October, the Secretary-General of the Union of Agricultural Associations in Western Germany at Bonn told me that in his opinion agricultural co-operative supply is more developed in Germany than it is here. But before these banks found the

Mr. H. W. Wolff.

1 June 1894.

money there was no agricultural supply co-operation that I have been able to trace whatever.

Qualification of members of the banks.

22,346. The existence of these banks seems to indicate that there are farmers in the district of varying degrees of means—some of them well-to-do and others badly off?—Yes. Of course, in Germany they are mainly freehold proprietors.

22,347. Mainly freehold proprietors?—Yes. This system was originally intended chiefly for the small owners—for the small peasantry.

22,348. Are they joined in by the wealthier members of the district?—Yes.

22,349. Then they can give something really more than personal security, because behind them they have got their individual ownerships of land?—What they pledge is their personal security.

22,350. Of course the question arises how far a system of that sort is applicable to the system of farming where the farms are cultivated by tenant farmers and not by their owners?—Yes, but then in France and some of these other places—I will not speak of this particular system, but where other systems of agricultural credit are practised—there are tenant farmers; and in Italy, more particularly in the district where the first bank was started in 1883, that is, in Venetia, and also in Lombardy, tenant farming is really in the preponderance. In Loreggia, for instance, the first bank was started in Italy by 32 men, three of whom were wealthy people (one was —— I cannot call him the squire, but he was the wealthy man living in the place, and the other two were the doctor and the priest), and 17 tenants; so that about 12 were small freeholders. Throughout Venetia and Lombardy, where the system is most developed in Italy, tenantry is in the preponderance. In the mountain districts where banks are very small and the people are very poor, they are proprietors, but the banks are weaker there than they are in the tenantry districts.

22,351. Then you think it is applicable to a system of tenant farmers?—Certainly. I refer in my book to a case where the Bank of France gave personal credit to farmers; that was purely to tenants, and tenants very much on the English style.

Systems of agricultural banks compared.

22,352. I think you say that there are several systems of this kind of agricultural banks?—Yes.

22,353. What is the best of these systems?—I think for small holders the Raiffeisen system, with the unlimited liability of all members (and not necessarily with shares) is certainly the best. It has been shown to be the best by experience. They are adopting it very largely now in France, and as I say, they have never had a loss. There is another system also in Germany; but it is not believed to have done very much yet for agriculture, though unquestionably it has done something. The Italian improvement upon this system, which is also practised in Belgium, seems to me the best of its kind. It is based upon limited liability, the liability being limited to the shares which are issued, which may be small or (as they more usually are) large. In Lorraine they have introduced a bank of this sort with 250 franc shares, which implies a liability of double that amount. But then you want in such a system as a committtee some administrators who are moderately familiar with the banking system, and who can carry on the undertaking as a bank. That is not applicable among very small uncultured folk.

22,354. Are they worked by paid officials or are they purely voluntary associations?—These banks as a rule have only two or three paid officials, of course in towns—but I should not like to speak of town banks now—where they have got large establishments, they have a large staff of paid clerks.

22,355. Then money can only be lent to a member of the Association, as I understand?—Yes.

22,356. And very great care is taken in electing the members of the Association?—Yes, that is so.

22,357. So that the money may be lent with security?—That is so.

Restrictions on employment of loans.

22,358. Is there any limitation as to what the loans are to be expended upon?—Yes. In the Raiffeisen system they always inquire into that, and in the other systems I find it is a growing practice to inquire into the employment of the loan—to ask what is the object that it is to be used for; and then to insist upon its application to that. If it is not applied as was stipulated, then the loan is at once called in. In Germany the banks reserve to themselves the right of calling the money in at any time at four weeks' notice, making the sureties responsible if necessary. In Italy, where they issue bills of exchange, they always issue the bills of exchange for three months at a time, for however long the loan may be granted, and if there is reason to call in a loan they do not renew the bill of exchange at the end of the three months. They always control the employment of the loan with great strictness.

Mr. H. W. Wolff.

1 June 1894.

22,359. Then the majority of these banks have co-operative associations attached to them?—Yes, in Germany.

Co-operative dairies.

22,360. Associated with many of them are there co-operative dairies?—There are some co-operative dairies which are working very well; I have only been to see one.

22,361. They are supplied with milk by members of the Association, I suppose, and they convert that milk into cheese and butter?—They really form, so to speak, a joint stock company, and borrow the money that is required for the purpose from the co-operative bank.

22,362. They collect the milk from the members of the Association, I suppose?—Yes.

Co-operative vintries.

22,363. And make it into butter and cheese?—Yes, or sell it as milk. I saw the dairy at Coblentz. Then the co-operative vintries are exceedingly useful. I want to recommend them in France. They have really nearly doubled the proceeds that the men receive and in some cases have actually doubled them.

22,364. By improving the quality of the wine?—In the first place by that. Then they get a certain reputation for the uniformity of the produce. But the great gain is the economy in the production. They have a common press; they deliver the grapes at the time of the grape harvest; the grapes are tested by squeezing them, and the proportion of sugar is ascertained, and according to that they are allowed so much in the rough, which is paid for with money obtained by credit from the co-operative bank. Then the wine is sold, and whatever surplus there is they get allowed for at the end of the year.

22,365. The whole system seems to be based upon co-operation and association?—Yes, it is.

22,366. Partly for the purpose of borrowing and of lending, and connected with it there are these other co-operative manufacturing establishments?—Yes, quite so.

Applicability of agricultural banks in this country.

22,367. Do you think that the system would be applicable to this country?—I do not see why it should not. I am not prepared to say that we could apply it in precisely the same way that they do in Germany and in Italy. The law is very adverse to us it appears. I am not a lawyer myself, but according to what Mr. Brabrook, the Chief Registrar (with whom I have talked over the matter), has told me, the law seems very adverse to us. Still, we have managed to draw up some rules.

22,368. In what respect is our law adverse to the growth of institutions of this kind?—Under the Industrial and Provident Societies Act, in the first place, no society must do any banking with withdrawable shares; but you cannot have a co-operative association without withdrawable shares, because if people do not know that they can get out they will not go in. If you select your original members you cannot go on forbidding them to transfer their shares to someone else indefinitely, although you can forbid it once or twice. So that means that you must let in people whom you do not know.

Selection of members of banks.

22,369. The whole system is based upon the careful selection of members?—Yes, it is.

22,370. If, therefore, the shares held by those members get into the hands of other persons, and outsiders should come in and claim a voice in the direction and a share in the profits, the system would break down?—It would be very likely to.

Disabilities of co-operative banks under English law.

22,371. Is there anything in our law which prevents the formation of societies and co-operative associations of this kind limited to selected members?—The case is difficult. There is the provision that no banking is allowed—that is, no taking of more than 10*s.* at a time as a deposit, and more than 20*l.* in all by societies with withdrawable shares.

Agricultural banks and deposit accounts.

22,372. It does not appear to me on the face of it that these are banks in the true legal sense of the term. They seem to be associations for borrowing and lending among themselves without anything in the nature of cheques or deposit accounts payable on demand?—They all have savings banks attached to them.

22,373. But it does not appear to be an essential condition of the associations that they should have savings banks?—I beg your pardon?

22,374. (*Mr. Channing.*) Would they not receive deposits and form reserves?—Yes, they form reserves.

Mr. H. W. Wolff.
1 June 1894.

22,375. (*Chairman.*) Are they in the nature of deposits which can be drawn on demand from the bank?—Yes. They take deposits in the German banks more or less in one form; but in Italy, in the Luzzatti banks, they have them for different terms—they have deposits for long terms at rather higher interest, and they have deposits that may be withdrawn at any time. The stimulating of thrift is considered one very great merit of the system.

22,376. Are the deposit accounts limited to members of the association?—They take deposits from anyone. They can allow rather more on the savings bank deposits than the Post Office banks can do, because they realise a higher per-centage.

22,377. Can they use the money deposited with them by outsiders for any other purpose than that of lending money to members of their association?—They may use it in whatever way they choose. The first object is to lend it to members. If they have got more they can deal with it in whatever way they please. These 1,300 banks, or the majority of them, at any rate, in 1876 formed a central bank at Neuwied, which takes their deposits at a certain rate of interest, and lends them whatever money they want at a rather higher interest. The interest is 3½ per cent. now that they allow and they lend out at 4 per cent.

22,378. I understood you to say that they could only lend to members of their association?—The central bank would only lend to the societies.

22,379. In the case of any local societies they can only lend their money to persons belonging to their association?—Yes, that is so.

22,380. In the event of any members of the association desiring to borrow, I understood you to say that the societies could then utilise their money as they think fit; but can they then lend it to other persons?—I do not think that case has ever arisen.

22,381. They always have enough applications for money from members of their own association?—Yes.

22,382. But inasmuch as they have deposit accounts, and outsiders can deposit money with them, they might easily become possessed of very considerable sums?—I think they would probably buy Consols, or something of that sort.

22,383. They would not lend money on the accounts of other persons than members of the association?—I do not know whether the central bank is entitled to do so, but the other banks are certainly strictly forbidden to do so.

Disabilities of co-operative banks under English law.

22,384. Then one does not quite see how it is forbidden in England; do you imagine it to be forbidden by our law that such associations can come into existence under our law?—Mr. Brabrook has told me that nobody has ever defined what banking is. On one occasion, when I was consulting him about the rules to be drawn up, he said: "We tried yesterday to define what banking is, and there "was nobody who could define it." But in the law it is particularly laid down that taking more than 10*s.* as a deposit at any one time, and more than 20*l.* in all, is to be considered banking under the Act.

22,385. Of course, associations of this kind in England and Scotland would have to compete with the existing country banks?—I do not think there would be much serious competition.

Rural branch banks in Scotland.

22,386. Are you aware that in Scotland the branch banks are very numerous—in almost every village there is a branch bank?—I asked Mr. Michie, of the Royal Bank of Scotland, the other day, as to the practice of cash credit which some writers abroad believe to be equivalent to this popular credit. From him and from other Scotch bankers I have learnt that it is very rarely indeed that a cash credit is given for as little as 50*l.*, and never for less; that the majority of cash credits are between 200*l.* and 500*l.*; sometimes 1,000*l.*, 2,000*l.*, and even more; some of them are 100*l.*; and some, but very few, go down to 50*l.* We are dealing with very much smaller amounts; 50*l.* is still the maximum which the Friendly Societies' Act allows us to lend out to one man.

22,387. I was under the impression that in Scotland the banks lent in very small amounts?—I wrote to the manager of the Caledonian Bank of Inverness, and he referred me to Mr. Michie, who is a great authority, he has edited the latest edition of Gilbarts' book, which is considered a standard book on Scotch banking; and that is what he told me. I asked Mr. Michie, and he was good enough to see me, and we had a long conversation about it, and I have used what he said. The Scotch cash credit does not seem to be a growing quantity. In 1826, there was an inquiry by a Parliamentary Commission which showed that there was about six millions lent out. There are no statistics now kept, but I asked Mr. Michie the other day, and he said: "I do not know, but I suppose six millions "is about the amount now;" so that it is not a growing quantity. Of course it has done a great deal of good to agriculture, but the agriculture which it has mainly assisted is the larger agriculture—the tenants with 19 years' leases in the Lothians; not the very small people.

Mr. H. W. Wolff.
1 June 1894.

Application of agricultural banks to systems of large farms and small farms compared.

22,388. The question would arise, how far the system is appropriate to a system of large farms, and how far it is likely to extend?—I should not recommend this Raiffeisen system for the large farms; I would sooner prefer the Luzzatti system, with the fully paid-up shares, and limited liability, managed by people who are rather more familiar with the practice of banking; because for large farms you want larger districts, as you would not find sufficient men in one parish to support one bank. I do not suppose that our larger farmers would go to the same bank as the small allotment holders would go to, because, of course, it becomes known what they borrow, and they would not wish to have that known by those men; they would sooner have a bank to themselves.

22,389. This system appears to have originated in districts where there is a considerable number of quite small tenants, or small proprietors?—Yes.

22,390. And then gradually to have extended?—Quite so.

22,391. But in England, as a general rule, in the agricultural districts, the number of small tenants is limited?—I know it is so; that is one of the difficulties. But then we are going to increase them, I think, considerably, under the Parish Councils Act; we are going to have a good many small allotment holders.

22,392. Small allotments may increase among the agricultural labourers, but I am afraid that is a somewhat slow process which might not be quickly developed?—Still, they will want money to work their allotments with.

22,393. You think the system is applicable to holdings so small as even the allotments held by labourers?—Certainly; that is the very class that I consider it most applicable to.

22,394. I was thinking you meant it to apply to small farmers who were cultivating land employed in a manner which would naturally involve a holding of 50 acres; but you think it would be applicable even to labourers' allotments?—Certainly, I think in one form or other it is applicable to holdings of all sizes. It is chiefly the small occupier who gets the land, and has not got the capital to work it with who wants assistance of that sort; and I think he gives additional security, because he gives the value of his labour as well. The improvement in prosperity and contentment and cultivation that the system has brought about abroad, is something very considerable.

State loans and agricultural banks compared.

22,395. Then do you think it is rather in this direction that aid can be given to the agricultural classes, as opposed to the system of direct loans by the Government?—The system of direct loans by the Government, or by large lending bodies, has broken down everywhere. They have tried it in Germany; they have tried it in Italy; they have tried it in France. The late Emperor Napoleon started a society about 1860, which was endowed with a million francs, and they could not get the people to come to them to borrow, and so they lent their money away to the Khedive Ismail, and they lost it all. There has been similar experience several times repeated in France, and similarly in Germany and Italy. Alsace is a very noteworthy example; they had got about 100,000*l.*, which they did not know what to do with accumulated in the local savings banks, and in the Communal funds. They did not know what to do with that, and the gentleman who was charged with drawing up a scheme for dealing with it explained it all to me in 1890 very carefully. They provided a most ingenious scheme for lending money for agricultural purposes to farmers and peasants; but nobody would come to them. Shortly after Raiffeisen established his co-operative banks there; and now there is not a province in the whole of Europe in which co-operative credit is more active, thus proving that Raiffeisen system is more satisfactory than the other.

22,396. You say that the system of State loans has broken down?—Yes.

22,397. Does that mean that the State found itself unable to collect the loans?—No, they could not get the people to borrow. In France and in Belgium they started what they called *Comptoirs d'Escompte* and *Comptoirs Agricoles*, in France with all the resources of the Bank of France at their backs; in Belgium with the National

Mr. H. W. Wolff.

1 June 1894.

Savings Banks at their backs. They have started with a local committee, who were, to a certain extent, to take the responsibility, and to receive certain profits in return. It was thought that these local committees would know the people in the locality who would be entitled to be given credit to. But they have not done any business whatever to speak of. In Italy they started Agricultural Banks in 1868, and in 1882 out of 37—out of more than 30, at any rate—there were only four still existing, and only two of those were doing any business; and now the peoples' banks are doing a very large business there.

22,398. Are there central associations connected with these local associations?—In Germany they have got several central banks. The Raffeisen system has got a central bank, but that bank was formed by the local associations. The strength of the system lies in the local associations. The local associations may after a time combine to form a central bank, which of course is a very great convenience, but it is not the central bank which starts the local association.

22,399. It is not the central bank which forms these associations?—No.

22,400. But rather the reverse?—Yes.

22,401. Just as these local associations grow, so they find it necessary to have some kind of combination in the form of a central body?—They find it useful. I may say that there was an inquiry by Royal Commission in Prussia carried on in 1874 and 1875; and it is mainly since that time that those banks have grown so considerably there.

Management of agricultural banks.

22,402. What class of persons manage these associations?—The main persons are the chairman (who is unsalaried) and the secretary and cashier, who is generally a schoolmaster or somebody a little versed in penmanship and accounts.

22,403. Is the chairman a large proprietor in the district?—They generally take some wealthy man if they can get him; but on the Rhine I have seen some of the richer peasants, not very highly cultivated men, acting as chairmen. The main responsibilities, I mean the main duties, rest upon the chairman.

22,404. (*Mr. Lambert.*) How large would the area be?—A parish by preference.

22,405. What would be the size of the parish; what would be its population?—It is difficult to say. I do not know that I am quite prepared to answer that.

Numbers and classes of members.

22,406. (*Lord Rendel.*) I think you said not less than about 30 persons started each bank?—Thirty would be a small bank, but they have started with 13, and 17, and 19, but then they always expected to grow. Raiffeisen says that a population of under 400 is too small, but in Italy they have got them in villages which have a smaller population than that. That does not mean 400 members; that means the population altogether.

22,407. (*Mr. Lambert.*) What would be the proportion of small holders, or holders who are engaged in cultivating for themselves in a population of 400 in Italy?—I could not say; most of them would give themselves up to agriculture.

22,408. I wanted to find out the difference between an ordinary labourer working for hire and a man who is cultivating as a tenant, or cultivating his own small farm?—There is no reason why the labourers should not join if they have got a productive employment for their money.

22,409. But I wanted to find the difference in the numbers, if it could be possibly done, in order to have some idea as to the applicability of the system to an English parish?—I think our parishes are, generally speaking, smaller.

23,410. But how many people would be engaged on hire in an Italian parish containing a population of 400?—I am not quite prepared to say. I think there is very little hired work. I think there is more cultivation of small holdings on their own account. I think in Venetia and in Lombardy there is generally little hired labour, and in the mountain districts still less.

Application of agricultural banks to England.

22,411. (*Chairman.*) Has there been any attempt yet to introduce it into England?—No, we have only talked about it. I hope that we shall do it very shortly. This Agricultural Banks Association was formed as a propagandist body to diffuse information upon it. I have been down to Leamington where Mr. Bolton King got a number of small people together, and they thought well of it. They think that as soon as the allotments grow more numerous they will be in a position to start a bank.

22,412. Then I gather from you that it would be in the first place necessary to consider carefully whether the law permits of an association of this kind?—I think we can begin before the law is altered, and then if we have got good results to show I think Parliament will be willing to alter the law. I should not wish to wait till the law was altered. I think people might object that we were asking that the law should be altered for a thing which might succeed or might not.

Mr. H. W. Wolff.

1 June 1894.

22,413. I thought I understood from you that it is doubtful whether they would be legal under the law at present?—We have got up some rules which I do not like, but I think they are the best that we can get under the present law, and I think under those we may begin work. Lord Hampden has expressed to me a wish to try it. He asked me about it just before I went abroad—to France, in April—and I am expecting to hear from him now. He has got a holding vacant in Essex, and he asked the labourers there why they did not take it in small lots. They said they had not got any money. He is one of our vice-presidents, and he said, "Here is a case clearly for an agricultural bank."

22,414. (*Lord Rendel.*) Would you call it in the nature of a friendly society as compared with English work of an analogous kind?—We have adopted the Friendly Societies Act simply for the reason that I have stated, that under the Industrial and Provident Societies Acts you must not lend out above 20*l.*, which is a very small figure, and under the Friendly Societies Act specially authorised societies may lend up to 50*l.*

22,415. Therefore the legislation that would control the project would be mainly legislation affecting friendly societies?—I think so. It is a co-operative society, and the Acts affecting our co-operative societies are mainly the Industrial and Provident Societies Act and the Friendly Societies Act. For larger farmers I should think that we ought to proceed under the Companies Acts.

22,416. As I understand, as regards larger farmers, you do not anticipate any considerable sphere for this scheme?—I do not see why not. I state a case in my book. I tried about 10 years ago to start a farmers' co-operative supply association in Sussex, and the people all approved of it. There are similar co-operative societies in various other counties which are doing good work. But these people, though they approved of the principle, would never join, and one of the leading farmers told me that I should not get them to join because they were all on their dealers' books and could not get off; so they were not free agents. That was one of the reasons which induced me to inquire carefully into this system in practice abroad.

22,417. Dealing with the scheme as a co-operative credit scheme, not as a co-operative supply association, I think we understood you to say that you felt that the publicity which would necessarily attend all transactions would rather keep out the larger farmer?—What I meant to say and what I think I did say, was, that that publicity would keep the larger farmers from borrowing of a small occupiers' bank. They would want to have a bank to themselves.

22,418–19. They would then come directly into competition with the country banks, I presume?—I do not think so; and I do not think they ought to. Their societies would do something that the country banks at present would not be prepared to do. The country banks lend on standing crops, and they lend on the general character of the farmer; but a farmer usually comes to them only when he is in a difficulty and when he wants to get out of it, and it is rather a desperate way of trying to get out of it; whereas these banks give credit to farmers as ordinary banks give credit to a commercial man—for a productive purpose. The farmer takes his farm; he finds people to trust him; he finds that by putting more manure in, by buying such and such a machine, by building such a barn or stable, or whatever it is, he can increase his profits and can repay his loan in a certain time, whatever that may be, two years, five years, or 10 years—they lend money occasionally for tolerably long periods—and then he comes to the bank and borrows the money for that purpose. He says, I can show you that by employing the loan that I ask of you for manure, or whatever it is, I shall increase my receipts to such an extent that within the stated period I can repay the principal with so much interest, and leave a profit to myself. That is the object that these banks are started for.

22,420. Then the basis on which you would rely for a larger business would be the security which the association had that the money advanced by them was being spent in a particular and definite and a remunerative way?—That is the principle throughout.

Mr. H. W. Wolff.
1 June 1894.

22,421. And in that manner you would differentiate the operations of the association from the ordinary operations of a country bank?—One may say so.

22,422. Then I understood you, I think, to rely largely upon the small business which these associations would be able to do in the way of giving petty loans for minor purposes, even down to the holders of allotments?—I do not think they should confine themselves to them, but that is of course what I take most interest in, because it would bring help to the people who stand most in need of it.

22,423. And you look to local insurance and local management as essential to any success which might attend it?—Certainly; but there are co-operative banks which give very much larger credits than they should to people who ought not to go to a co-operative bank at all. M. d'Andrimont, in Belgium, will not allow a loan of over 2,000 francs—that is, 80*l.*—in his bank. He says people who want more had better go to other banks.

22,424. Are any reports summarising the results of this scheme or system available?—There are a good many reports out. I have got some materials in my book. For the Raiffeisen system generally there is no complete *statistique*, though one is now in preparation, and will shortly be published. I proposed at the People's Bank Congress at Toulouse a little more than a year ago that statistics should be collected, and the French Government undertook to collect them, but they have not proceeded very far yet, because there are very great difficulties in the way.

Agricultural banks in France.

22,425. Taking France in the first place, do these associations prevail much in the Metayer parts of the country, or are they mainly in those parts where *la petite culture* is practised?—I do not think there are many in what are generally recognised as the Metayer districts. In France the whole thing is rather new. M. Durand, of Lyons, started it on the Raiffeisen system, and he has about 56 banks now. They have done well so far, but, of course, upon so short a period of existence you cannot form a conclusive judgment. There are several other systems in force in France. There is particularly the Poligny system, where they have got two classes of members—they have got rich and they have got poor; and they have lent out since 1885 nearly a million francs on a capital which originally amounted to only 20,000 francs, and they have never experienced a farthing's loss. The Agricultural Syndicates are less perfect, I think, than the Raiffeisen system. They have an inquiry now by the *Conseil Supérieur du Travail*, and the upshot seems to be that they all consider the Raiffeisen system the best for agricultural purposes. They appointed a Commissioner to inquire into it, whom I have been coaching to some extent, and who is going to present a report. They are very anxious to establish this system generally in France.

22,426. Is the system prevailing in the Nièvre?—In the Nièvre, that is a different system. That is simplicity itself, really. An intelligent bank manager, M. Giraud, who is now at Marseilles, came down there in 1866 or 1867; he found that the graziers obtained their bullocks to fatten and send to market very much as our graziers do here, but that they did not do justice to their pastures, and at the same time upset the local banking system by drawing out all their money in the spring and paying it in in October and November in inconvenient masses. So, having got the authority of his chief at Paris, he proposed to these farmers, many of whom are big men, and some of them very big men, that if they would find two additional signatures he would lend them what money they wanted simply on a bill of exchange which was to run for from six to eight months so as to enable them to fatten two relays of beasts, and then they were to repay out of the money that they realised at the Villette. That has succeeded to a great degree. He calculates that in 10 or 11 years he has lent out between 130 and 140 million francs, and that he has put 25 million francs into the farmers' pockets. He has never suffered any lost except on one occasion, and that was through his own fault; he did not ask the tenant who borrowed the money to show his landlord's receipt. It happened that the tenant was in arrear, and so 50,000 francs worth of beasts were seized by the landlord by distraint.

22,427. (*Mr. Giffen.*) How much did he lend altogether?—It was 50,000 francs.

22,428. Altogether?—He had 2,000*l.* worth, that is what M. Giraud states. The evidence is official, and it is given in an inquiry which was made in 1880.

22,429. You mentioned the aggregate amount of the loans in a certain period that he had made, what was it?—From 130 to 140 million francs is the amount he states in his evidence, and he calculates that he put about 25 million francs into the farmers' pockets by that method. He lent at one per cent. above bank rate, and to people living at a greater distance whom he did not know, he had a fixed rate of six per cent. The overplus over the ordinary rate went into the Bank of France.

Mr. H. W. Wolff.
1 June 1894.

22,430. (*Lord Rendel.*) That you adduce, as I understand, as an example to show the value of mere forms of providing advances?—Yes.

22,431. But not as on all fours with the scheme of co-operation?—No, this is a different thing. I simply stated it to show of what utility credit may be to farmers. During the drought of 1893—last year's drought—a member of one of the Agricultural Ministries, the agricultural department in one of the Thuringerian Duchies, admitted that these agricultural banks had done more to help agriculture than the federated governments had done in coming to their assistance in removing the cattle from places where they sold for a song—where a full-grown bullock fetched 2*l.*—to districts which were less affected, where they could realise larger prices, and then when the farmers wanted their beasts back they lent them money, which they could do with perfect safety. What is mainly in their favour is that they have never lost a farthing in all this time.

22,432. You point out that this system has succeeded in Germany to a very large extent; that it has succeeded in Italy, and that it is having considerable success in France?—I should not like to say considerable success in France. They have been begun in France and the French are very keen upon them. They have inquired into the subject and they are very anxious to start these banks. They have started 56 of them in a great hurry, and it remains to be seen what good they will do. I think they will do well there as they have done everywhere else, but I could not say now that it has been successful there, because it is only about two years ago or something of that sort that they were started in that country.

Agricultural banks in Germany.

22,433. But of course this system must already have had application in a very wide variety of agricultural production?—Yes, that is what I think. I have seen it in force and doing good service in the new Colonies in the Eastern Provinces of Prussia, where they are cutting up large estates and creating villages out of deserts, so to speak. It is one of the most successful measures they have instituted in Prussia since Stein and Hardenberg. The President of the Association charged with this work has shown me one or two of these banks which have been begun among people who were brought together from different parts of Germany into these new settlements and have promptly begun to start these agricultural advance-banks which supply them with their working capital for agriculture.

22,434. Might we not, perhaps, say that Stein and Hardenberg were at the foundation of this system by their establishment of the freehold occupier?—That was for peasants; that was not for the small people like this.

22,435. Then you discriminate between the peasants and the small people?—Yes, but I have simply brought in Stein and Hardenberg to shew that I really do not think there was any more useful agricultural measure put into operation in Germany since the reforms of Stein and Hardenberg. I did not compare the one with the other.

22,436. With great variety of agricultural production is there not, as a rule, a great prevalence of freehold occupation in Northern Germany?—In Germany there is.

Application of agricultural banks to freeholders and tenants compared.

22,437. Would you say that that was the mark of the area to which this system has hitherto been applied?—Yes, there; but in Italy there is a great deal of tenant holding where these banks are established. The leaders of the movement do not allow, of course, that there is any difference in the utility of the system for tenants or for freeholders. It is equally applicable and equally useful to both, because it is based upon personal credit. That is what Léon Say says. He says: "What pleases me in these "banks is that they practice personal credit."

Effect of cash credits on moral habits.

22,438. Secured by personal observation—by the control one of the other?—By that control one watches the other, and as soon as one goes wrong the other one warns you. I have got here what has been noticed about the Scotch credit system, which is said to raise the moral tone of the Scotch farmers so much, because it makes them all watch one another. I have got letters from the Statistical Office in Hungary. This is what is said about cash credit in the evidence given before the Lords and Commons Committee of 1872: "The system has a great effect upon the moral habits of "the people, because those who are sureties feel an interest "in watching over the borrowers' conduct, and if they

Mr. H. W. Wolff.
1 June 1894.

"find that the borrowers are misconducting themselves "they become apprehensive of being brought into risk of "loss through becoming their surety, and so if they find "the borrowers are so misconducting themselves they "withdraw their surety." They watch one another, and that compels them to be honest.

22,439. (*Mr. Everett.*) Your system seems, then, to be one that may be briefly summarised as capitalising character?—That is what Luzzatti calls it. He calls it capitalised honesty.

22,440. It seems to be singularly well adapted for small people engaged in small agricultural transactions, and wanting money to buy a pig or anything of that kind?—Quite so. In Italy I have looked through the books, and have found that it is chiefly used for that purpose. When they want to buy a *vacca* or a *maiale*—a pig, or a cow—or a calf, or that sort of thing, then they borrow.

Parish Councils and agricultural banks.

22,441. Our parish councils which are about to be established, and which will afford an easy means of obtaining small plots of land, would seem to afford both the opportunity of getting the land to work and of initiating these banks in order to get the money with which to work the land?—I do not think the parish councils could do it.

22,442. They could initiate it?—They might initiate it.

22,443. Evidently you could not take a parish council *en bloc* and make its members the bank, because they would be very likely elected to their position without regard to their particular suitability for forming that sort of bank?—In Switzerland, in two Cantons, the parish councils do these things, and in nearly half the Canton of Thurgau the parish meeting decides whether they ought to raise a fund. They do not want a large fund for that. They have got about 6,000*l.* now—150,000 francs—in addition to a fund of 1,000*l.* which is limited to one particular locality. They agree to raise this fund on their joint security, and out of it lend money to anyone who wants to buy a cow, or a calf, or sometimes goats. They always inquire into the case; they value the beast, and they check it from time to time. They have bought a a large number of cows, something like 600 or 650, and one man told me that by the aid of one of these societies men now kept three cows where they formerly used to keep one in consequence of the assistance given to them by these funds. They have lost money only in that one particular parish where there is a fund of 1,000*l.*, which obliges them to lend to anyone who asks, so that they cannot check the borrowers so carefully, and they suffer loss in consequence.

22,444. I was rather thinking that these new parish councils would afford a very ready means of bringing the subject under the notice of the people in their respective villages?—Yes, I think they might do that.

22,445. And also of obtaining the land for the people and showing to the people that by forming themselves into these banks they could not only have the land but they could have the money with which to work the land?—That is what I was thinking of. Between 600 and 650 cows have been bought in Thurgau by these means, as I have said, and cultivation is very much improved, and the local prosperity has very much increased.

22,446. There are money clubs in England, are there not?—Yes, there are some.

Money clubs in England.

22,447. Do they go into matters as small as these, do you know?—I think they really lend chiefly to stop a hole—if a man wants money for some particular case of need. For agricultural purposes you want long loans; but these money clubs can never grant them for very long periods, because all their money is open to withdrawal. Our self-help societies, which are very little known, have shown how safe lending is to small people. The Self-help Society of St. Pancras, consisting of costers and railway hands, and that class of men, in six and a half years has lent out about 8,500*l.*, and has only lost seven shillings. The Self-help Society of Ealing has lent out in six years over 5,000*l.*, and has not lost a farthing; and only in respect of 11*l.* have the sureties been called upon to pay up. In that case 6*l.* had been guaranteed by the Vicar, and he was considered fair game for pillage, but he has been disqualified, for his own protection, from serving as a surety in the future.

22,448. (*Mr. Channing.*) Is that a Raiffeisen bank?—No, but it shows how honest the people become when it is their own money and their own funds that they are made guardians of, and when they are responsible to one another. People who think nothing of fleecing a rich man will never think of fleecing one of their own class mates.

22,449. The English loan societies have had very heavy losses, have they not?—They have, so far as I have been able to ascertain from the Chief Registrar.

Mr. H. W. Wolff.
1 June 1894.

22,450. One of the great features in your researches into these societies abroad is that they nearly all, with the exception of the Schulze Delitzsch, have had practically no losses?—The well managed have no losses whatever. The Wollemborg Societies in Italy and the Raiffeisen banks in Germany have had no losses whatever.

22,451. Those are purely co-operative?—Yes.

Co-operative banks in Italy and Germany.

22,452. And conducted by local self-government?—By local self-government of the most democratic sort.

22,453. In what sense do you mean that they are purely co-operative? I do not think you have stated whether there are dividends or not in these societies?—They do not allow any dividends. They began by having no shares at all, and so there could not be any dividends, and there ought not to be any dividends. They want to keep out any inducement for self—any idea that a man is to get anything out of them. When Prince Bismarck forced shares upon them, they made the shares as small as possible —10*s.* to 12*s.*—and they voted the dividends away to the reserve once for all.

22,454. The profits are really used for cheapening credit, and forming this strong reserve?—Cheapening credit and forming this reserve, which, of course, becomes a rock of solvency to them.

Relation of co-operative banks to other banks.

22,455. You were asked questions about the relations to other banks; as a matter of fact, a good many of these societies abroad, in Italy, for instance, were formed in this way, were they not; the large banks gave what were large cash credits, I suppose you would call them, to these societies in the first instance, in order to enable them to re-lend?—No, I beg your pardon, that is my idea of what we could do here. I think that the people could guarantee a cash credit at a bank; some wealthy people might do it for the local bank to operate with. In Italy they do not know that system, and they simply borrowed the money. They borrowed 2,000 lire or whatever the figure might be, for a certain length of time, and the savings' banks, which have a great deal of money at their disposal, and often do not know what to do with it, were very glad to lend to them. In Germany they had difficulties, but in Italy, except in Wollemborg's first bank, they had no difficulty that I have been able to hear of.

22,456. The direction of my question was this, that these societies would really obtain money on loan to a certain extent from the banks?—Yes.

22,457. And so would be feeding the banks rather than competing with them, would they not?—Yes, but then there are local banks which raise all their money by savings, and I should like to point out that I have found out that the savings that those banks collect, not only the agricultural banks, but all those co-operative banks, are savings over and above what the people put into the savings banks. I asked the presidents of two of the largest savings banks in Italy, the Bank of Milan and the Bank of Bologna, whether the saving done by the co-operative bank was done at their expense. They brought out their books and showed me the figures. They said the people's Bank of Milan was established in 1866, and you can see the figures going over the whole period of years. We did not at first go on increasing quite so rapidly as we did before, but after two or three years the whole thing was wiped out, and we went on just as before. Here are 10 or 11 millions sterling savings in the people's bank, which is quite outside what is saved by other means. These banks give a great additional inducement to saving, and a very potent one.

Indebtedness of English farmers.

22,458. As a matter of fact very large classes of farmers in England are heavily in debt now, are they not?—I believe them to be, I have heard them to be so, but I could not say that of my own knowledge.

22,459. You are not prepared to give any evidence as to the facts published recently in the "Pall Mall Gazette" then?—I could not from my personal knowledge. I have seen a good many of the papers, especially those relating to Sussex, which were shown to me, and of course I took an interest in them, but I do not think I am competent to give any opinion upon them.

Co-operative banks and insolvent farmers.

22,460. Are you able to give an opinion as to the possibility of applying these banks in order to rescue farmers from their creditors as has been done in Germany?—It has been done to a very large extent in Germany. In the case of people who were really ruined, and were on the eve of being sold up, those banks stepped in; and also in Italy. Sometimes a very small loan has proved efficient, a

Mr. H. W. Wolff.

1 June 1894.

very small loan to begin with, until they have bettered their position. The banks have done that to a very large extent, and so have rescued poor people from the claws of the usurer. That is one of their great merits.

Loans on personal security and mortgags compared.

22,461. One of the advantages of the system of going on personal security as against mortgages is that a small sum of money at the disposal of one of those societies can be used over and over again in a large number of loans by avoiding the system of giving security in the form of a mortgage, and giving it in the form of personal security?—Yes. They have found that a mortgage was a most inconvenient method to adopt, because it locks up the money; and in some of the Schulze Delitzsch banks they found they had to foreclose, and that has landed them in loss. I have a letter from the head of the Agricultural Department in Saxony, in which he says that the losses suffered by that means are very great. The Raiffeisen banks, by taking purely personal security, have avoided that danger.

22,462. The sense of working with fellow-members of the society has stimulated the men to be honest and careful, and to make good their repayments; and so has gradually built up a better commercial morality, as it were, amongst the farmers in Germany and Italy?—It has done so to a very surprising extent. In the evidence taken by the Royal Commission which reported to the Prussian Government in 1874, there is evidence from judges, one of them being now Judge of one of the Chief Courts of Appeal, to that effect. I have quoted in my book the evidence given by M. Rostand and M. Léon Say, who have seen the thing at work. What it amounts to is this, that the people in the parish, seeing what advantages the bank offers, are very anxious to join. Their character, say, is not very first rate, and so when they come and apply for membership, the Committee say, No, we will not have you at present; you must mend your ways first. They mend their ways, and come back, and then they get admitted. Where there was a good deal of thieving, for instance, that has been discontinued, in order to be admitted. The evidence of these judges shows that there is very much less litigation, especially about the purchase of cattle, where balances were owing for beasts. There has been no litigation whatever to speak of, where formerly there was a great deal.

22,463. All that is applicable to small farmers, and would be very useful to them?—I should think so.

Application of co-operative banks to English farming.

22,464. You do not see any difficulty, providing you can get the English farmers on a larger scale to understand such a system, in its working satisfactorily among them?—I think the main difficulty is about understanding it. This is so totally different to anything that we have got here that people cannot at once understand it. I must confess that it took me a very long time to master it, travelling abroad, and looking into it and asking questions.

22,465. The English farmer looks upon borrowing as a means of staving off ruin; he does not look upon it so much as a method of carrying out his productive work, does he?—I think that is so. I think we have had no system of agricultural credit yet to speak of, to compare with the system of commercial credit.

22,466. The object of your Association is rather to stimulate that idea among the farmers, is it not?—Certainly; it makes them so much more businesslike, and it makes them calculate, which is greatly wanted here, I think, on what transaction they make a profit, and on what transaction they make a loss. It makes them go into the cases more carefully. Here, now, they look at the whole thing, and at the end of the year, if it brings them a net loss, they do not know on which transaction they have made a gain, and on which transaction they have made a loss. But this banking stimulates their sense of business; it makes themcalculate beforehand, and put down figures, and they find themselves the better for it.

Interest on loans advanced by banks.

22,467. (*Mr. Lambert.*) What rate of interest is allowed to depositors?—That varies according to the bank, but it is always a little less than the interest which the borrowers pay. In some cases the difference is only half per cent., in some cases it is one or one and a half, and in some cases it is 2 per cent.

22,468. What is the rate they allow usually; there must be, I presume, some uniformity?—I do not think there is, because every local bank is free to fix its own tariff.

22,469. What is the most usual?—I should say about 3 to 4 per cent.

22,470. They charge the borrowers half per cent., or a little more than that, more than they give to the depositors?—That would depend upon the size o the bank in a large bank they could work with 1 per cent., or a half per cent. difference, but in a small bank they would have to charge about 2 per cent. difference at least.

Mr. H. W. Wolff.

1 June 1894.

Capital necessary to start a co-operative bank.

22,471. How much money would it take to start one of those banks?—I suppose a very small sum would be sufficient. It all depends upon the needs that are likely to arise. Raiffeisen supplied all his three undertakings, the co-operative bakery, the Co-operative Cattle Purchase Association, and the first bank, with 300*l.* of borrowed money.

22,472. I mean to begin a co-operative credit system in a parish with a population of 600 say?—I do not think it is possible to say. I myself fancy that a very small sum would be sufficient at first, because the transactions would be very small to begin with.

22,473. Could you estimate the sum?—I do not think I could.

22,474. What is the most usual amount of loan granted?—I do not think I could say that, but as a rule they are small loans.

Security for loans.

22,475. Is character the only security, or must they have something more tangible, for a loan?—They want character; they want it to be accepted as members; then they want sureties; and they want to state the employment of the loan in order to show that they are going to turn it to good account.

22,476. Does that mean as sureties, what is known in common parlance in country districts as coming in bonds for a man?—Yes, it means that a man is responsible for the debt.

22,477. I mean that there are other men who are responsible to the bank for the borrower's repayments; he has to find sureties in that sense?—As a rule he has got to find sureties; so that there are really three classes of people responsible. In the first place the borrower himself is responsible; and then, if he should fail, there are the two sureties (as a rule there are two), and after that, if those sureties fail, then the whole of the members are responsible.

Number of members for small bank.

22,478. What is the most suitable number of members for a small bank; what should you estimate as being the lowest number of members that could work a bank of this description?—That is difficult to say. The lowest that I have heard of as beginning a bank is 13, but that is really a very small number, and, of course, they expected to have additions to their numbers after some time.

Capital of co-operative banks from deposits and loans.

22,479. I suppose you can go up to an unlimited number?—I do not think there is any maximum limit to their number, but it is limited by the size of the district, of course.

22,480. Before they can lend out any money, they must have a deposit?—Unless they can borrow; they generally begin by borrowing.

22,481. I mean to say, when a thing has got started they must, before they can lend out any money on land, have a deposit?—They must have a loan; they can raise that loan either from the bank or from an outside person, or by taking deposits.

22,482. (*Mr. Giffen.*) Are not loan and deposit to a banker equally a liability of the bank?—Yes.

22,483. The same thing?—Yes. They generally begin by getting some philanthropist, who wants to help them, who wants to give them support, to lend them a sum of money, for which they make themselves liable; or else, now, they go to the Central Bank. Some people have been exceedingly grateful for being granted a loan, and the Director of the Central Bank told me that they give perfectly sufficient security, which the Central Bank were quite satisfied with.

22,484. (*Mr. Lambert.*) Supposing there were more borrowers than depositors, the thing would not be able to go on, I presume?—Yes, because they borrow from the outside. For instance, they go to the Central Bank, and the Central Bank goes to the Imperial Bank in Germany, which corresponds in that country to the Bank of England here. They say, "We have got so many members; we want a loan of 200*l.* or 250*l.*" whatever the sum may be, "will you lend it to us." They say "yes"—after a time, they always say "yes"; at first there may be some difficulty. Then they begin with that money, for the deposits only come in later. The people take a wonderful interest in their bank as a savings' bank. They prefer it to the Post Office Savings' Bank, because it is their own, and because they know that the money is kept in their district and can be profitably employed there.

22,485. I presume it is your idea that the superflous capital (of which there is very little in our country districts,

as you can imagine) should be used for giving assistance to those who have not a sufficient amount of capital?—There is always plenty of capital in the country.

22,486. Quite right, but in the wrong peoples' hands?—Quite so; I agree with that. That is one point on which Luzzatti, the late Minister of Finance in Italy, justifies the co-operative banks of which he has introduced one very successful system. He says formerly the money (and Sir —— Lumley in the Parliamentary report of 1886, quotes him) of the country used to be sucked into what Cobbett calls the "wens;" it all went into the large centres; now, with the help of those banks, it remains where it is raised, The capital is distributed over the country and it remains in its own district to fructify there.

22,487. Would these banks be a success unless depositors are prepared to deposit amounts with them in order to cover the loans that they make: the banks would not be such a success had they to go to an outside bank for a large loan upon their own credit?—I do not see that it makes any difference. Of course the savings' bank is proof that the spirit of thrift has been stimulated, which in itself is a great thing; but as far as the borrowing is concerned, I do not think that it makes any difference whether they have raised the money by deposits or whether they have got it from an outside lender.

Mode of establishing a co-operative bank in a small parish.

22,488. (*Mr. Dalton.*) How would you exactly start one of these banks in a small parish? You would have a certain number of labourers in the parish who had saved money, and a certain number who had not saved; do you think those who had saved would join for the purpose of borrowing money, or that it would be those who had not saved who would join; who would be the men who would have an inducement to join one of these banks in an ordinary country parish?—My impression is that people would be very chary to deposit at the outset—they would be very careful; and that it would be mainly the people who wanted to borrow who would come.

22,489. Then you would get 30 or 40 men in one of those parishes who wanted to borrow money who would join it?—Some of them I suppose would be people who needed to borrow money, and others would be people who wanted to help what they consider a good cause.

22,490. But I am speaking of the labouring men; I am not speaking of a philanthropist assisting them. You think that the labourers who joined would be the men who wanted to borrow?—Yes, I should think so.

22,491. Do you think you would get enough of these in an ordinary country parish to form a bank?—If there were not enough there would be no room for a bank; and I would sooner have no bank at all than a bank which there was no occasion for.

24,492. You would require 30 or 40 at least who would want to borrow small sums?—I should be prepared to start with fewer. The question has to be considered, how few are sufficient. The Bank of Loreggia started with 30; others have started with 19; one started with 13. I think if I found 20 or so who were willing to try, I should be perfectly content to go on with them.

Outstanding loans of German co-operative banks.

22,493. (*Mr. Giffen.*) You told us that there were no statistics of these banks, I think?—There are statistics of some, but, unfortunately, the principal statistics are not at present out, though I am expecting them very shortly. A representative of the Italian system told me at Bordeaux a few weeks ago that he had got his Italian statistics ready. The German statistics are in preparation. They have been going on compiling them since last October, so that they ought to be out very shortly.

22,494. Could you give me a rough idea of what the aggregate loans of these 1,250 banks in Germany would be at the date of the last balance-sheet—I mean the amount outstanding?—I do not know. I have got a balance-sheet here, but I do not know how far it is complete. That shows about half a million sterling to be out.

22,495. On one bank?—No, on a number of small banks. I do not claim for them at all that they do a very large business like the town banks, but I claim that they help people who are not otherwise to be helped.

22,496. I wish to understand what the aggregate of the business comes to altogether, in order to give us some idea of what part it has in the economic life of a country?—In one bank of about 250 members, which has raised up a reserve fund of 1,500*l.*, I think the lending amounts to about 2,000*l.* a year.

22,497. How much at one time is outstanding?—Here is a little bank; I cannot say what is outstanding at any time, but it has 250 members, and it has got a turnover of about 35,000*l.* That is an exceptionally prosperous one.

22,498. Per annum—that is a large bank?—I will not call it an exceptionally large one, but an exceptionally prosperous one. It is on the Rhine, where an acre of land fetches 288*l.*, and there is very good cultivation here.

22,499. That is the turnover?—Yes; but it is exceptional.

22,500. It is not the amount outstanding at one time?—I am afraid I could not say what that is.

22,501. Take a small bank, how much would the turnover of a very small bank be; what is the smallest you are acquainted with?—I do not think I have got any figures to show that, although I have got some figures here.

22,502. Would there be banks going on which have less than 500*l.* outstanding at one time?—Yes, there would be plenty.

22,503. A good many of those 1,250 banks then are banks which have not 500*l.* out on loan at one time?—I daresay that is so; I cannot say positively, but I have not the least doubt that that is so. I am quite satisfied that a good many of them do a very small business.

Large co-operative banks and small banks compared.

22,504. You referred to a bank which you said had lent a million francs, that is about 40,000*l.* in the period from 1885 to 1893; was that a large bank?—I beg your pardon. I think you misunderstood me. I said that the French Government started a bank assisted by credit about 1860 with a million francs capital. I think that is the only connexion in which I mentioned the precise sum of a million.

22,505. My note is that they had lent a million francs in about nine years; you do not recollect mentioning a case of that kind?—Yes, that is the Poligny case. That is one I do not recommend.

22,506. Was that a large bank?—That is not one on my system at all, and one of the managers admits to me that the system of Raiffeisen is superior to theirs, and that they are going to transform themselves.

22,507. It is the scheme of business that I wish to have some idea of; would you call that a large bank which lent 40,000*l.* in the course of nine years?—I think that is a large bank, but it is not a bank at all on the system that I recommend.

22,508. I quite understand that, but still you would call it a large bank?—Yes, but then you must remember they began in a very small way.

22,509. I quite understand that, I merely wish to get at the exact facts, what you consider a large bank and what you consider a small bank?—They in 1892 lent out 212,000 francs and in 1893 only 183,000 francs, because many people parted with their cattle on account of the drought. They explain that.

22,510. That was a large bank?—A tolerably large bank.

22,511. If a great many banks have outstanding at one time less than 500*l.* and you consider it to be a large bank which lends about 4,000*l.* to 5,000*l.* in one year would it be a fair calculation do you think, to say that in the case of all these 1,250 banks in Germany the amount of loans outstanding at one time would not be more perhaps than 1½ million sterling?—I could not say, but I daresay that might be so.

22,512. It is not a very large business altogether?—Perhaps not. I should not like to attach any weight to its being a large business, because the danger that we find in some co-operative banks is that they become large, and and that they then cease to be co-operative. The 1,250 banks spoken of are the banks of the Raffeisen system only; there are a large number of others, even in Germany, not reckoning the town banks.

22,513. Then in this country, for a time, at any rate, considering the conditions of this country, and that we have not got the class of peasant proprietors or small farmers to so large an extent as they have on the Continent, the business done would probably be very much less than that figure?—I do not think that that follows. I think that once our people understood it, they would take it up with very much greater vigour, and that it would spread over a larger part of the country.

Effect of agricultural banks on allotments and tenancies compared.

22,514. But you have not the people?—I think under the Allotment Act we shall have the people.

22,515 You think you would have the people?—I should think so.

22,516. That brings me to another question that I should like to put: you anticipate a great success for this banking

Mr. H. W. Wolff.

1 June 1894.

system under the Allotments Act, do you not?—I believe so. I think it is likely.

22,517. So that if a considerable part of the agricultural area of the country was taken up for allotments, for which, usually, people pay a better rent than for ordinary agricultural land, that would be a very good thing for the landowners?—I think it would be a good thing for all classes.

22,518. It would be a good thing for the landowners and for the people who had the allotments?—It would be a good thing, in the first place, for the people who had the allotments, and no doubt it would indirectly benefit the landowner.

22,519. Would it be a good thing for the present class of tenant farmers who can hardly make both ends meet, and whose rents would be raised probably by this competition?—I do not think it would hurt them, and I should be very sorry to see rents raised; but I do not see that that quite follows.

Manner in which capital is obtained for co-operative banks.

22,520. (*Sir Nigel Kingscote.*) I should like to understand how these banks start. I have tried to gather how they get their first capital, but all I have gathered at present is that, unless there is a philanthropist who would produce the capital as required, they must borrow it?—I do not look upon it as philanthropy. At the outset, before the system was first tried, no doubt they did, as a rule, rely upon a philanthropist, but they pay the ordinary interest; they buy their capital just as the Rotbschilds buy it, and as the Bank of England buys it: they pay the usual interest.

22,521. We will say that 20 people at the beginning will start one of these banks. As I understand they do not put down any money of their own?—Some of them do a little, and some do not. It is not essential to the system that they should do so.

22,522. Not essential?—It is not essential.

22,523. They must have money from somewhere?—They must have money, and they borrow it.

22,524. Then they have to begin by paying interest, I suppose, for that money which they borrow?—Certainly, they pay interest, and they do like every other bank does; they borrow it, say, at 3 per cent., and lend it at 5 per cent., and keep the 2 per cent.

22,525. In practice when they have to borrow this money to start with, do they borrow it at a cheaper rate than those whom they borrow it for pay?—Yes.

22,526. How do they manage that?—I beg your pardon?

22,527. (*Mr. Dalton.*) Is it that 30 people joining to borrow, borrow at a lower rate of interest than they each would borrow at singly?—Of course they borrow at a cheaper interest than they lend out at.

22,528. (*Sir Nigel Kingscote.*) They do?—Yes.

22,529. (*Mr. Dalton.*) They lend it out to themselves? Yes. The bank collectively borrows the money at the cheapest rate that it can get it at, and it lends it out at the cheapest rate that it can do so without making a loss; but there is always a difference of 1 per cent. or 2 per cent. or somewhere there about.

22,530. (*Sir Nigel Kingscote.*) In practice these banks established in Germany and elsewhere have been able to lend money at a cheaper rate than we could borrow it at here or individuals could borrow it here at their banks?—You mean to say that the members borrow it at a cheaper rate of their own bank than they could of outside people?

22,531. No; you have said that these banks have to borrow money, and that they have to charge their members an interest that will cover the interest that they are paying for that money?—Yes.

22,532. But I suppose they have some means of paying back the capital?—Yes.

22,533. As a matter of practice is that interest a larger interest than individuals borrow at from banks here with sureties? You say each man must have as sureties two bondholders, and we will take an individual here with two bondholders?—I think a small man would have a very great difficulty in borrowing what he needed at 5 per cent., without a great deal of trouble and asking a favour. I suppose he would not get the money. There is one thing I think it is material that I should state—indeed, there are so many things I should like to have said, but it is so difficult to get hold of the thing, and we are a little bit at cross purposes because the thing is so entirely new. To show the way they start these banks I may mention that several of the provincial governments in Austria lend the banks newly started 3,000 florins, I think it is for two years at 3 per cent. interest; after the two years they are bound to repay it, and they generally do.

22,534. In instalments?—I suppose they generally do by instalments. The individual borrowers are always required, when they borrow for more than a year, to repay by instalments and they are very strict in insisting upon that repayment. The President of the Colonisation Commission that I have been speaking of, told me himself that when he was the Landrath (that is a sort of petty sessional Lord Lieutenant, one might call it) in Silesia he started two such banks with the help of the Communal savings bank that he had got. Those savings banks are entitled to employ their money as they think fit, and he lent out money to these two new banks at 4 per cent., which they repaid in a very short time and very much faster than he expected.

22,535. Then really, as a matter of practice, these banks that you have had practical experience of, or at least that you have seen, get their money either from the state or from some large proprieter who—I must use the term again—is a philanthropist and who lends it to them?—Not philanthropists—men of business; and I should not like to say the State; these are provinces with provincial governments.

22,536. Did you not use the word "State" just now. You said the State in Western Austria, I think?—In Austria it is the provincial governments; in other places it is the savings' bank, but that is not a State Institution. That is a savings' bank belonging to the "circle" as they call it—the arrondissement. They have self-government in these things. They have got their own savings bank, of which the Landrath, the chief administrator of the district, is the head, and they have power to invest their money as they think fit; and he has used the savings bank money which belongs to the district in lending it to the loan bank.

22,537. And you say that practically there has hardly, if ever, been a case of fraud?—There has been no loss.

22,538. They have never lost money through fraud?—There have been cases of fraud, but only few; and the banks have suffered no loss by their involving a new tax upon members; they have recovered from sureties and out of the reserve.

22,539. (*Lord Rendel.*) I think, in your examination-in-chief, you said that in starting one of these associations the capital was raised by loan upon the security of the joint and several liability, unlimited liability, of some 30 or 40 persons who associated themselves together?—Yes.

22,540. Therefore the bank would look to the personal credit of the 30 or 40, and would look to find that there was one or more individuals among them whose unlimited liability would be an adequate security?—It would have done so in the first instance, but now that the thing has become so common, I do not think that there is any question about it. Of course they look at the bank.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Forty-second Day.

Thursday, 7th June 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. BARON RENDEL.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., } *Assistant*
FREEMAN THOMAS, Esq., } *Secretaries.*

His Grace the Duke of Richmond and Gordon, K.G., &c.

7 June 1894.

HIS GRACE THE DUKE OF RICHMOND AND GORDON, K.G., &c. called and examined.

His Grace the Duke of Richmond and Gordon, K.G., &c.

7 June 1894.

22,541. (*Sir Nigel Kingscote.*) As we know, your Grace was President of the Royal Commission appointed to inquire into the state of agriculture in 1880–82?—Yes, I was.

22,542. You have, I believe, large estates at Goodwood, in the county of Sussex?—Yes.

22,543. You have also large estates in Scotland?—Yes.

The Goodwood Estate.

22,544. Taking the Goodwood Estate first, will you tell us how many acres it comprises?—The Goodwood Estates comprise 19,716 acres, of which 11,844 are arable and pasture; 4,263 down; and 3,608 forests and plantations.

22,545. What sort of size are the farms on the estate?—There are 32 farms on the estate which range from 50 to over 500 acres each. There are four farms between 50 and 100 acres; 12 between 100 and 300 acres; 5 between 300 and 500 acres; and 11 of 500 acres and upwards.

Land in hand.

22,546. Have you any of those farms in hand at the present time?—Yes, I have five on hand.

22,547. What is the acreage of those?—The acreage is about 2,300. That is exclusive of the Home Farm; I have five in hand over and above the Home Farm.

22,548. That Home Farm I conclude you have had in hand for many years?—Yes, for generations.

22,549. Have you had those other farms in hand long?—One I have had in hand for four or five years, and one I took in hand this last spring.

22,550. Have you tried to let them?—Yes, I have tried, and I am very anxious to let them. They are chiefly farms with a good deal of down, and I fancy that the reason I do not let them is that farmers have not had the capital to embark in a sufficient quantity of sheep to stock the farm, and in these times they do not like to risk it.

22,551. Those five are large farms I conclude?—Yes, they are a fair size, averaging about 600 acres.

22,552. Taking those you have had in hand for some time, might we ask what has been the result of your own farming; whether it has been a loss or what?—One of them is a very good farm, and I certainly have not lost on it, I think I have made money on it.

22,553. Do you charge yourself a rent?—Yes.

22,554. And interest for the capital?—Yes. The one farm that I am surprised at not being able to let is rather situated a good way from the village. I think farmers may not like to be there; as it is rather a lonely place.

22,555. Far from railway accommodation?—Yes, it is four miles from a railway station.

22,556. With steep hills to till?—Yes.

Rental.

22,557. As regards your Goodwood Estate, might we ask what its actual rent is?—The actual rent received in 1892 was 13,878*l.*; the agreed rental was 17,800*l.*, so that the arrears and deductions amounted to about 4,000*l.* Some of the tenants are on yearly agreements, and some hold on lease, but I made the same deduction to them all.

22,558. Does that 13,878*l.* include the rent of the farms in hand?—Yes. I make out that with the remissions I have made this last year (when I thought it necessary to make an additional remission of 10 per cent.) for every 100*l.* of rent that I ought to get, I only get 63*l.*, and I remit 37 per cent.

22,559. Basing the rental on what year; do you go back 20 years or 25 years?—No. I say that for every 100*l.* of rent I ought to receive I only get 63*l.*

22,560. Does that include arrears and what you allowed?—Not arrears but remissions.

22,561. When did the reductions of rent begin?—They began in 1879.

Reduction of rent.

22,562. That is rather what I wanted to ask your Grace; what is the reduction of your rents comparing 1879 with 1892 and 1893?—Before 1879 there was no remission, and calculating from that time up to this last year, the reductions have been 27 per cent., and last year 37 per cent.

Leases.

22,563. You have mentioned the word "leases," are your farms in Sussex held upon lease?—Some on leases and some on yearly agreements.

22,564. Of late years have you been able to let them on lease?—No, they do not like leases in the south so much as the yearly agreement. I prefer leases very much, both in the interest of the landlord and especially in the interest of the tenant.

Cottages.

22,565. What was the length of the leases generally before?—The Goodwood leases are for 14 years; that is by the Estate Act; I could not give more.

22,566. Can you tell us how many cottages there are on the Goodwood Estate?—I have 402 cottages, of which 203 are let with the various farms at rentals of from 1*s.* to 2*s.* a week; 29 are rent free; and the remainder are occupied by the workpeople employed by me on the estate.

22,567. Have they gardens?—Every cottage that it is possible to give a garden to I give a garden of an eighth of an acre, which I find quite as much as they want.

22,568. Have you any demands for allotments besides?—Not a great many; there are some. I may mention one case, where I was building a new pair of cottages, and was setting out some ground for gardening, I wanted to see what half an acre and a quarter of an acre looked like on the ground, and the man who was going into the cottage begged me not to give him more than the eighth of an acre, because he could not do justice to more.

22,569. Do you consider your labourers well housed, taking them generally?—Yes, I think so. My friends

His Grace the Duke of Richmond and Gordon, K.G., &c.

7 June 1894.

consider that I have a sort of craze on that subject. I endeavour to have the best cottages I can. I have spent about 30,000*l.* since 1873 in building 86 new cottages, and repairing old ones. I find that if ever I buy a pair of old cottages, I have to pull them all down, and build up new ones.

22,570. Then you spend a very large sum of money in building these cottages?—Yes.

22,571. Can you tell us the aggregate rental from the cottages?—The aggregate rental of the cottages that I get now is about 1,280*l.* a year. The average annual return from the cottages for 20 years is 1,135*l.*, while the average annual expenditure on the cottages works out to about 1,472*l.*, so that that is a dead loss.

Small holdings.

22,572. Have you any small holdings on the Goodwood Estate?—Very few. There are a few acres of grass-land let as accommodation land, and there are 78 allotments.

22,573. Are those allotments rented high, or are they rented according to the rents around?—No, they are not rented high; the rent is from half a crown to 4*s.* 6*d.* for about 20 poles. I find where they have good cottages and good gardens attached to the cottages that they do not care about the allotments. The greater number of the allotments that I have on my property are outside a village where they have no gardens; where the village does not belong to me, and the cottages have been built upon ground only just big enough to hold a cottage, without any means of giving gardens. Outside that village I have given allotments.

Form of lease.

22,574. To return to the question of the leases, could you hand in your form of lease?—Yes (*see* Appendix).

22,575. Do you wish to call attention to any particular clause in that lease?—Yes, I do. I may say that I drew up this lease very much in consequence of the evidence on the Royal Commission of 1880. I thought that my lease wanted a little alteration, and I took advantage of the information that we got on that occasion to draw up this lease. I wish to call attention

Division of rates.

to Clause 18, "The landlord will pay the land tax, and "landlord's income tax, and the tithe rentcharge due "and payable in respect of the demised premises"—then this is what I thought important—"and half of "such new and additional rates and taxes as may be "hereafter assessed upon the premises." I thought it was rather hard upon a tenant if he had a lease, and when he signed the lease thought that his rates and taxes were a certain sum, and therefore that he was justified in giving the rent which was asked, if during the currency of the lease fresh rates and taxes were imposed upon him, which were what he could not possibly have expected when he took the lease; and therefore I put in this clause, that the landlord should pay half.

22,576. Is that put in your agreements for yearly tenancies?—Yes.

Freedom of cropping.

22,577. Is there any clause in your lease as regards freedom in cropping?—Yes, there is this clause:—"The "tenant shall cultivate and manage the arable lands "in a husband-like manner, and shall keep the said "lands clean and in good heart and condition, and "during the last four years of the tenancy shall farm "the lands upon the four-course system of husbandry, "that is to say, one-fourth part in fallow or root crops, "one-fourth part in lent corn, one-fourth part in "clover or good grass seeds, and the remaining fourth "part in wheat."

22,578. Then for any period except the last four years he may farm very much as he likes?—Yes, but I find that they farm generally on one system; they find the four-course system suits the country.

22,579. (*Mr. Channing.*) May we know what the length of the Goodwood leases are?—Fourteen years. I cannot give more by the provisions of the Estate Act.

22,580. (*Sir Nigel Kingscote.*) Before leaving Sussex may I ask whether you are chairman of the board of guardians?—Yes, and I have been since the death of my father in 1860.

22,581. The Chichester Union, in which Goodwood is, I suppose, is a very large union?—Goodwood is in the West Hampnett Union, not the Chichester Union—the Chichester Union is outside. There are 36 parishes in West Hampnett.

Rates.

22,852. As regards the rates can you tell us whether they have increased or not?—I do not think they have.

22,583. Not taken generally?—No, not throughout the union. I think the subventions that we have had from the Government have helped to keep the rates down.

His Grace the Duke of Richmond and Gordon, K.G., &c.

7 June 1894.

22,584. Are they about the same as they were 20 or 25 years ago?—Yes, I think so.

Estates in Scotland.

22,585. Now we will turn to Scotland, please. Perhaps you will kindly tell us how many acres your estates in Scotland comprise?—There are 269,290 acres in the counties of Inverness, Banff, Aberdeen, and Elgin, and the estate in Scotland measures about 70 miles in length.

22,586. Can you tell us how many acres there are in each county?—Yes. In Inverness there are 27,409 acres; in Banffshire, 159,950 acres; in Aberdeenshire, 69,660 acres; in Elgin, 12,271 acres. Of the total area, 49,000 acres are arable, and 220,290 are mountain land, rough pasture, woods, &c.

22,587. Can you give us a statement of the number of the tenants and the size of the holdings?—Yes. There are 882 tenants, 327 of whom pay under 10*l.* a year. Of the remainder there are 112 tenants who pay above 10*l.* and under 20*l.*, 183 who pay above 20*l.* and under 50*l.*, 134 who pay above 50*l.* and under 100*l.*, 75 who pay above 100*l.* and under 200*l.*, 26 who pay above 200*l.* and under 300*l.*, 13 who pay above 300*l.* and under 400*l.*, 7 who pay above 400*l.* and under 500*l.*, 2 who pay above 500*l.* and under 600*l.*, and 3 who pay above 600*l.* and under 650*l.*

22,588. That comprises all?—That is the whole estate.

Expenditure on improvements

22,589. Can you give us any statement of your expenditure on improvements on your Scotch estates?—Yes. Since the year 1860 I have expended on farm buildings 126,245*l.*; I have expended on cottages 28,856*l.*, and I have expended on draining 43,055*l.*, making a total of 198,156*l.* There are other expenditures on the estate which do not come under the head of agricultural improvements.

22,590. Further sums?—Yes, but not money spent upon farms. I have built a harbour, and so on.

22,591. Was any sum you spent in building the harbour money spent for the sake of giving a more easy access to the market for agricultural produce?—No. It is a small harbour; there was an old wooden harbour there, and it became a question of whether it should be renewed or not. I felt that if it was not renewed the people who live there—it is a place called Port Gordon—would have nothing to do, in fact, I do not know what would have happened to them, so I thought it right to build up the harbour, which I had built of concrete at a cost of 15,000*l.* in order to enable them to remain there and fish in the sea. But the harbour does did not anything like repay me for the money I laid out. But that expenditure I have not calculated here, because I do not consider that as belonging to the farms.

22,592. That is not in the sum of 198,000*l.*?—No, it is outside it.

Abatements of rent

22,593. Now as regards the abatements of rent during the last 15 years on your Scotch estates, they have been considerable, have they not?—Yes. The abatements of rent during the last 15 years have amounted to 88,198*l.*, and if I were to calculate up to the present time they would amount in the last 15 years to 100,000*l.*

22,594. Can you give us the abatements in the last three years?—Yes. In 1890 I abated 8,144*l.*; in 1891 8,065*l.*; and in 1892 9,286*l.* The reason that 1892 is larger than the year before was that it was a very bad year up in the higher districts—up in Glenlivet—and I had to make a greater remission to them. It was a very late year and a very bad harvest.

22,595. Then the per-centage of reductions and abatements of rent on your Scotch estate was very much less than those upon the Goodwood estate?—Yes, certainly.

22,596. Could you say to what extent?—Yes, I can.

22,597. What is the per-centage then?—In Scotland the property is divided into three districts. There is first of all Enzies, which is where Gordon Castle is situated. It is near to the sea; it is about nine miles from Elgin. Then there is the Glenlivet district, which is on higher ground in the upper part of Banffshire, towards Balmoral and that way; and then there is the Huntley district. I have not given the same

remissions to each district, but I have dealt with them as I thought they required. In the Huntley district in 1879 I gave off 20 per cent., and in Glenlivet I gave off 20 per cent., but nothing in the Enzie district, as I did not think they wanted it. Then Huntley next year was 20 per cent, then 5 per cent., then 15 per cent., then (in 1886) 15 per cent., in 1887 25 per cent., in 1888 25 per cent., in 1889 22 per cent., in 1890 20 per cent., in 1891 20 per cent., and in 1892 20 per cent. I gave off very much the same in the Glenlivet district, except that in the year 1892, thinking they were very badly off and would be—they had neither meal nor seed—I gave off 30 per cent. Then in Enzie it has varied from 5 per cent. in 1884 to 10 per cent. in 1885 and 1886, then two years at 20 and the rest up to the last year at 15 per cent. That remission is upon land equally held by lease and by yearly tenancies.

22,598. Is most of it held on lease?—Yes, the greater part; all the leases are for 19 years.

Form of lease.

22,599. Does the same agreement hold good in Scotland, or is it rather different to the Sussex agreement?—It is different altogether. Here is a printed form of the lease on the Scotch property, together with the articles, regulations, and conditions, under which the farms are let (*see* Appendix).

Personal supervision of estate.

22,600. I understand that your Grace takes a personal supervision of all these abatements and reductions?—Yes.

22,601. That nothing is done without your knowledge?—Nothing is done on the estate without my express sanction.

Tenure of holdings in Scotland.

22,602. In the building or rebuilding of your steadings we hear from a sub-commissioner that your Grace is very particular about the bedroom accommodation for the men, and everything else as regards families?—Yes, certainly.

22,603. Have the holdings in your Scotch estate been occupied by the same families for any length of time?—Yes, I have shaken hands with a man whose great-great-grandfather was out in '45 with Charles Edward. They never change. In the Huntley district, in the parish of Cairney, there are six families who have been there for four generations and more. In Drumblade there are nine; in Gartly there are 17; in Huntley nine; in Rhylie one; and in Kennethmont there are four.

22,604. We have it in your brief that in the Fochaber district 15 tenancies have been in occupation in the same family since 1773, and 52 since 1809?—Yes; and in the Glenlivet district there are 50 representatives of tenants who were farming the same holdings between 1765 and 1785, and there are some cases where the ancestors were out in 1745.

Pesonal supervision of estate.

22,605. I believe nothing is done in any way to interfere with tenants on the estates from the smallest crofter and cottager to the largest farmer without your sanction?—No, I go into it all myself. The three divisions have got a factor each and a commissioner over the whole. We meet once a year, and if there are any new leases to be granted, or any rents to be fixed, I hear what they have got to say and then decide for myself. I fix the rent, and I should not take a rent from anyone if he offered a bigger sum than the one I thought was right. I should offer it to the old tenant at the rent which I considered, after consulting with my factor and commissioner, was the one which ought to be paid, and if anybody else offered to give me a larger rent I should not take it.

22,606. Would you sooner keep the old tenant on the land if he was a good farmer?—Yes. Besides I should know that that was a fair rent, and if the man outside wanted to give a bigger rent I should think that he did not know so much about it as we did.

Letting by tender.

22,607. Would you be against letting farms by tender?—Certainly; I never did it but once and then it was a very great failure, for I got a very bad tenant. I was obliged to do it on that occasion. I disliked it very much, but I was bound to take the highest bidder, and unfortunately he was a man that I had declined to have as a tenant several times before.

Relations between landlord and tenant

22,608. May I ask whether, in your experience on estates both in England and in Scotland, the general feeling between landlord and tenant is on a very good footing?—I should say excellent.

Land courts.

22,609. Would you favour any proposal to introduce land courts or any other tribunal to interfere between landlord and tenant?—No, I should be distinctly opposed to that. I think I and my tenants can manage our own affairs ourselves better than with the interference of any outside parties. That is my experience.

His Grace the Duke of Richmond and Gordon, K.G., &c.
7 June 1894.

Cattle disease.

22,610. To go now to a different subject. I believe you have had some experience as regards cattle diseases?—Yes. I stamped out the cattle plague in 1877 when I was at the Council Office.

22,611. You have had experience as being at the head of the Privy Council Office, and also practically?—Yes.

Slaughter of foreign cattle.

22,612. What is your opinion as regards the slaughtering of cattle at the port of debarkation?—I am strongly in favour of their being slaughtered at the port of debarkation. I think if you could get this country entirely free of disease you would get more cattle bred in it than you can get when there is a chance of disease coming. I am rather confirmed in that view by what I see in the paper—that is all the information that I can get—to the effect that there have been animals with disease coming from Canada when Canada was supposed to be quite free.

22,613. Would you be in favour of keeping up those restrictions as much as possible?—Certainly.

22,614. (*Mr. Everett.*) Your Grace presided over the last Royal Commission which sat on the depression of agriculture, did you not?—Yes.

The Royal Commission on Agriculture, 1880-2.

22,615. I find in the principal report presented by that Commission some 14 remedies or alleviations for the depression in agriculture, which was found existing then, were suggested. I have a list of them here and I will just read it. The first was "Aid from personal property to rates"; there has been a considerable subvention tending to that, has there not?—Yes.

22,616. The second was "Division of rates between owner and occupier"—nothing has been done in regard to that?—Pardon me, I have done it myself.

22,617. Individually, but legislatively there has nothing been done?—Yes, that is so.

22,618. Then better cottages were suggested—they also on large estates we know, have been built in a great number; the fourth suggestion was to forbid the landing of live cattle from where disease exists—that also has been done; the next was to facilitate and cheapen the transfer of land—that still remains in arrear, I am afraid; another was to lay land down to grass—unfortunately that is going on rapidly; then protection against adulteration was another—there has been legislation directed to that end; another was to label produce by right names—that also has been dealt with to some extent; another was to give compensation for improvements, and that has been sought to be granted under the Agricultural Holdings Act; the next was freedom of cultivation, which practically exists, I believe, on all estates now; the next was to change tithe to a fixed sum—your Grace would probably agree now that if that recommendation had been carried out it would have been a calamity to landowners instead of a blessing?—Well, I do not quite understand.

22,619. It was recommended at that time by your Grace's Commission that tithes should be fixed at par, was it not?—Yes.

22,620. That is at 100*l.*; it has now fallen to a little over 70*l.*, I think, so that that recommendation would have been adverse to the interests of agriculture if carried out?—I pay the tithe; all my farms in Sussex are let tithe free.

22,621. Still your Grace would have considerably more to pay every year now for tithe had that recommendation of the late Commission been carried out; your Grace would have had to pay 100*l.* where now you pay 73*l.*?—Yes.

22,622. Then the Commission further recommended that the tithes should be made payable by the landlord; that has been done; the equalising of railway rates—there has been legislation in that direction, but not very successful, I am afraid, and the appointment of a Minister of Agriculture—that has also been done. Generally, I would like to ask your Grace this question: Notwithstanding that most of the recommendations which your Commission made have been carried out, agriculture to-day is in a much worse condition than it was when that Commission sat?—Yes, because the prices are so low.

His Grace the Duke of Richmond and Gordon, K.G., &c.

7 June 1894.

22,623. I think I noticed in looking over what passed before that Commission that the question of the connexion between monetary changes and agriculture was not at all touched upon by that Commission?—If you mean bi-metallism, certainly not.

22,624. Has your Grace paid any attention to that?—Not the least, except reading some of Mr. Chaplin's speeches.

22,625. Then your Grace has not had your attention directed to the Commissions or the Committees of the House of Commons and House of Lords which sat on agricultural depression earlier in the century, namely, between 1820 and 1837?—No.

22,626. (*Mr. Channing.*) I suppose the report of the former Commission on Agriculture represented your Grace's opinions generally at that time?—Yes.

Low prices.

22,627. I think it would perhaps be of interest to this Commission if you would express any further opinions that you feel disposed to express as to the present position?—I have nothing to tell the Commission except that what we are suffering from is low prices.

Division of rates.

22,628. I gather from the adoption in your own leases of the principle of the division of the new rates that you approve of that being done by Act of Parliament on equitable terms with regard to other properties?—Yes, I think it would be very fair. What I do myself I should think right for other people to do.

Leases on the Goodwood Estate.

22,629. Now I understand that your Sussex leases are for 14 years, and that for the first 10 years the tenants are left free to farm their land as long as they farm it in a husband-like manner?—Yes.

22,630. Would you contemplate under leases of this kind a renewal of the lease towards the end of the tenth year if the farm was being thoroughly well worked?—Yes, they always go on.

22,631. That would be the system under which such leases would be worked—from your point of view?—Yes. I think a landlord is a very foolish man if he gets rid of a tenant when he can possibly keep him.

22,632. Now I would like to put to your Grace one difficulty with regard to the leases which of course is obvious at the present time; the average value of produce 20 years ago was very much higher than 10 years ago, and that was very much higher than it is now?—Yes.

Sliding scale of rents.

22,633. Would any lease be workable unless you had some sliding scale or some power of revision to meet that fall of prices?—I should not like a sliding scale, I prefer a fixed sum.

22,634. The objection of the tenants to a lease, now I suppose, is that agriculture is such a venture—that wheat may be down to 15*s.* in five years?—Yes, but when they do not take a lease they have a yearly agreement.

22,635. But that is the difficulty in farming on a lease. You would object then to the introduction of leases with any sliding-scale arrangement adjusted to prices?—Yes. I think it would be very inconvenient. If a man does not like a lease I give him a yearly agreement.

Estates in Scotland.

22,636. Your properties in Scotland are of a very varied character, I think. For instance, I suppose the Huntley Estate would be quite different from the Glenlivet Estate in regard to the character of the farms?—Quite, and the Enzie Estate would also differ. I have known them in Enzie district, which is near Gordon Castle, begin their harvest about the 10th of August, and up in Glenlivet, in a particular part of it called Glenlinnes, they frequently do not begin harvest until the first week of October.

22,637. Practically, I suppose, it is sheep grazing there, is it not?—No.

22,638. Not up in Banffshire?—No, not altogether.

22,639. You expressed a thorough disapproval of letting farms by competition?—Yes.

The fixing of rents.

22,640. May I gather from that that you think it is fair that rent should be based upon some average estimate of the productive powers of the land?—That is rather a wide question. What I do is this: I have every farm inspected by my own people, and when they report to me what they consider to be the right rent I go into it and cross-examine them as to what induced them to come to the conclusion they have, and then I either accept it or lower it, as the case may require.

22,641. Is your Grace aware with regard to the penal rents that in the valuations after them the practice is to reduce the payment to an estimate of the actual loss sustained?—I do not know that.

22,642. (*Mr. Lambert.*) Have you ever let your own farms under your own valuation; or have you always succeeded in getting the rent that you fix?—It is in this way; if I fix the rent and the tenant thinks it too much, then if he asks me to reduce it I have done that sometimes.

22,643. And you would base your estimate upon the valuation of your factor?—Yes, he would tell me what he thought the farm was worth, and then I should go into the question with him before I offered it to the tenant.

The Agricultural Holdings Act.

22,644. Have you had many cases of tenants quitting under the Agricultural Holdings Act?—No, not one.

Leases.

22,645. You state in your brief that you are in favour of leases, could you give us the reason why you are?—Yes. I think they are for the benefit of the tenant, and for the benefit of the landlord as well. I can give you an illustration of it in a case that took place, not on the Scotch Estate, but on the property at Goodwood. I had just arranged with a tenant to give him a 14 years' lease, and I had signed the lease and he had not, and the poor man died, and he left his widow with a family of children. I thought it would be very hard upon her if she had no place to go to and no means of bringing up the children, and so I told her that I would put her into the farm in the place of the husband she had lost. They had it for the 14 years, and she was able to bring up her family very comfortably.

22,646. Is it not also to the advantage of the cultivation of the soil, the fertility of the soil, that a man should have fixity of tenure in a degree?—To a certain extent, yes; but I think it is to the interest of the man whether he has a lease, or whether he has a yearly tenancy, to farm properly; if he farms badly he will not make money.

22,647. Is it not an inducement for a farmer to farm better when he has a certain tenure of his farm?—No, I do not think so, because all my tenants who have got yearly agreements look upon it that they are likely to remain there and they treat it almost like a lease.

22,648. So, of course, your tenants are in the position of having practically fixity of tenure?—Well, it is pretty nearly fixity of tenure, when you come down from 1745 to 1894.

22,649. Therefore they have no scruples on that score. Have you given a great deal of attention to any remedies for the present state of agricultural depression?—No.

Low prices.

22,650. You say we are suffering from low prices; would you be in favour of remedying that by the artificial raising of prices?—I do not quite see how it could be done.

22,651. You think such a case would be impossible?—I will not say impossible, but it does not occur to me how to do it.

22,652. Impracticable?—I do not understand how it could be done. Of course, if we could get higher prices, I should not very much mind how it was done if it was done properly.

22,653. You do not see any means of doing it?—No, I do not know how to do it; if I did I should very soon put it into operation.

Freedom in cropping.

22,654. (*Mr. Little.*) Your Grace told us that some of the tenants on the Goodwood Estate were yearly tenants?—Yes.

22,655. Have they the same freedom of cultivation as those under lease?—Yes.

22,656. Then the arrangement as to bringing the land back to a particular course in the last four years of the tenancy does not apply in that case?—No. I have always looked upon it that the yearly tenancy is likely to go on, and I have never thought how I could arrange with them for the four years.

22,657. As a matter of fact you could at any time put the stopper on; if you saw a yearly tenant going too far you could give him a caution?—Yes, I suppose I could.

22,658. There is that difference between a lease and a yearly agreement; that with a yearly tenant he can be stopped if he is doing too much in the way of flogging

His Grace the Duke of Richmond and Gordon, K.G., &c.

7 June 1894.

Cottages.

the farm? Then with regard to the cottages, a number of them are let with the farms, I understand?—Yes.

22,659. Has the farmer a complete control of the cottage under those circumstances?—The cottages are only let by the month. I do that for this reason: supposing that I consider a tenant is not treating the labourers properly—for there are good tenants and bad tenants—if I considered he was asking the labourers too high a rent, I should then have a power of taking the cottages back into my own hands at the end of the month.

22,660. As long as the tenant treats his cottagers fairly, he has the power of turning out a man who does not suit him?—Yes.

22,661. And if he does not exact a higher rent than you charge, you do not interfere?—Never.

22,662. He has practically the control, although you retain a right by which you can protect the cottage tenant?—Just so.

22,663. Do you know, as a matter of fact, whether the farmers generally let the cottages, or do they give them rent free in return for extra services?—I should think it is both ways. I should think the man took probably a carter at so much a week and a cottage.

22,664. You charge from 1*s.* to 2*s.* a week, I think you said?—Yes, from 1*s.* to 1*s.* 6*d.* for the cottages let with the farms.

22,665. Which is a very small sum upon the actual cost?—Very small indeed.

22,666. Do you know what the average cost of cottage building has been with you in Sussex?—A pair of cottages cost me at least 400*l.*

22,667. Without charging anything for the land on which they stand and the garden ground?—Yes, that is merely the building.

22,668. Do the repairs fall upon you?—They were falling on the tenants, but I found very often that they did practically fall on me.

22,669. Therefore the building of the cottages is not practically remunerative?—It is not remunerative in the sense of giving a monetary return.

22,670. Not as an investment?—Not as an investment, but it is in making the labourers comfortable and contented.

22,671. And that is indirectly advantageous. But a great many good cottages are still required in various parts of the country for labourers. I do not mean on the Goodwood Estate, but on many others?—Yes; and some of mine are not as good as I should like to see them.

22,672. The inducement to men who are not men of fortune to build cottages which only pay 1½ per cent. is not very great?—Not as an investment, certainly not. My cottages show a loss on the outlay.

State loans for building cottages.

22,673. It has been suggested that advances of public money at a low rate of interest might be made for the purpose of building cottages; would you approve of that?—Yes, I think that would be a very good thing; but I do not like borrowing myself.

22,674. The Government lend to the Irish sanitary authorities money at a very low rate of interest repayable within a term of 50 years, for the purpose of providing cottages; do you think it would be advisable to advance money at a similar rate of interest to the landowners of England for the purpose of providing cottages?—Yes; I think it would be an advantage.

Bothies in Scotland.

22,675. With regard to Scotland in the counties where your estates lie there are a great many bothies, I believe, are there not?—Yes.

22,676. And you have insisted upon these bothies being built of a greatly improved character?—Yes; to a certain extent I am getting rid of the bothy system.

22,677. You have also insisted where bothies are built, I think, that there should be a separate bedroom for each man?—What do you call a bothy: do you mean a bothy attached to a farm—in the house?

22,678. I meant detached from the house?—Labourers' bothies?

22,679. Yes?—I improve those as much as I can, and build good cottages.

22,680. I read in Mr. Gillespie's report to the Labour Commission that you were insisting upon a separate bedroom for each man?—Yes; those are attached to the farm; those are within the steading.

22,681. I suppose there are a great many bothies there still which are very disgraceful?—I will not say disgraceful, but not as good as they should be.

His Grace the Duke of Richmond and Gordon, K.G., &c.

7 June 1894.

22,682. They are rather horrible dwellings. Would not a sufficient number of cottages replace the system of bothies?—I think we are rather at cross purposes. You say that the men have a bedroom to themselves. Those are the herdsmen who live in the steading.

22,683. Then cottages would not accommodate them?—No.

22,684. They would not require cottages?—No, they would not, but I am building on the Scotch property separate cottages—good cottages.

22,685. And an increase in the number of cottages tends to diminish the necessary number of bothies, I presume?—Yes, to a certain extent it does.

22,686. Then if the bothy system is a bad one, as many people seem to think, the substitution of cottages would be a distinct advantage?—No doubt.

22,687. And the opportunity of borrowing money on more easy terms might lead to a diminution in the number of bothies?—Yes.

The Agricultural Holdings Act.

22,688. I think you said that the Agricultural Holdings Act had not been put in force on your estate?—No, it has not, but I have never contracted out of it.

22,689. But I suppose that valuations on that principle have been made as regards manures and feeding stuffs?—On what occasions do you mean?

22,690. When a farmer quits he is entitled to some compensation; I see from the form of your agreement that the manure belongs to the farm, but he would be paid, I suppose, for feeding stuffs consumed?—Yes.

22,691. Would that not be under the Act?—I do not think I have ever been under the Act really.

22,692. You have not had a notice of the intention to claim?—No.

22,693. Then it is settled by the valuers without having recourse to the Act?—When a tenant goes out he appoints a valuer and the incoming tenant has a valuer, and those two valuers decide what is the proper sum to be paid to the outgoing tenant.

22,694. And whatever has to be paid is paid by the incomer?—Yes.

22,695. Then it is entirely confined to manures and crops and tillages?—Hay and matters of that kind.

22,696. It does not include any permanent improvements?—No.

22,697. Then if no notice has never been given to you compensation has not been awarded under the Agricultural Holdings Act, though I presume it should be?—That I do not know—that is for the outgoing tenant to say.

22,698. The Act of 1883 provides that for such things as may be compensated for under the Act, compensation shall not be given by any other means, but it is done, you say, by a simple valuation?—Yes.

22,699. It is so in most parts of the country, though it is an evasion of the Act, I believe?—I will not say that.

Estates in Scotland. Rent

22,700. (*Mr. Gilmour.*) The rental given on the Scottish estates, I suppose, does not include any of the sporting rents?—No.

22,701. It is purely agricultural?—Purely agricultural.

22,702. Have sporting rents advanced there during the last 20 years—during the time given on this table which you have sent to the Commission?—No, I should say not—not on my estate, at any rate.

22,703. Have they remained almost stationary?—Some might have increased a little, but not much.

The letting of farms.

22,704. I do not quite understand how your Grace proceeds to get your new tenant on a man leaving; do not you advertise your farms?—No.

22,705. How do you reach the bulk of the men in the country wanting farms?—If I have a farm vacant there are generally some members of the family who apply to be taken on as tenant. I have let three farms this spring. They were vacant one by the death of an old man; another because the man's health was bad and he wished to go abroad, and I forget what was the reason in the third case. One farm was 32 acres arable with a little pasture, and I had eight applicants for

His Grace the Duke of Richmond and Gordon, K.G., &c.
7 June 1894.

that; another was up in the Glenlivet district; that was 60 acres, and there I had five applicants; and for the other one, which was in the same district, I had four applicants. They were not advertised. It was known in the district that they were vacant. Generally speaking, some members of the family want the farm, or, at all events, someone in the neighbourhood.

22,706. In Scotland it is very unusual, I think, not to advertise farms; in the way in which your Grace arranges it, it is simply on the hearsay of the district that people know that a farm is out of lease or to be out of lease?—Yes, I find no difficulty in getting tenants, and generally the tenants belong to the particular district.

22,707. But there is no reason if the landlord advertises his farms why he should not out of the men offering, select, as you do, without advertising, the best man without reference to rent?—I do not like the system of advertising. I think it induces a man to offer more than he can afford for the purpose of getting the farm.

22,708. Will not that be the case, too, when you have these five people who know the farm; are they not in exactly the same position—are they not all anxious to get the farm?—There is this difference: they do not make me an offer; it is I who make them an offer. They come to my factor, and they say, "I understand "such a farm is to be out of lease; I should like to "be the tenant; what is the rent?" Then my man tells them. I fix the rent, and then I select out of the five applicants the man who I think would make the best tenant at my rent.

22,709. (*Mr. Little.*) You do not set them bidding one against another?—No, certainly not; I think that would be fatal.

Reduction of rent.

22,710. (*Mr. Gilmour.*) We have been told here by some witnesses that the solution of this state of depression was a re-adjustment of rents still; would you consider that that was the fact?—I have reduced the rent, and therefore I have given practical reason for thinking that if things remain as they are at present a reduction of rent is necessary, because I have given it myself.

22,711. Then, according as prices fall, you would still have to go on giving these reductions?—If prices fall I certainly shall not be able to put them back to the old rent before the remission.

22,712. Is there any other way in which the tenant can be helped to meet these times than that?—No, I do not know of any but higher prices.

The fixing of rent.

22,713. (*Mr. Clay.*) I have great pleasure in seeing my old chief back on another Commission again. There are only one or two questions I would like to ask your Grace. Regarding what Mr. Gilmour says of the rent, as I understand, you and your factor have always fixed the rent according to what you think, in your generous way of dealing with your tenants, they can get out of the land?—Yes.

22,714. And if you find that even that rent, through depressed times, is excessive, you have always been willing, I know, to consider a re-adjustment again?—Yes.

22,715. That is fair and reasonable between landlord and tenant?—Meetings have been held and resolutions drawn up thanking me for the remissions which I have given.

Reduction of rent.

22,716. If all landlords had dealt with their tenants in the same way that your Grace has very nobly done, I know there would not have been so much depression as there has been throughout the country; that is, if they had considered the re-adjustment of rent according to the depressed prices of agricultural produce, there would not have been so much depression as there is at the present moment?—Of course I should not like to speak for other people. I have thought it right to do it in my own case, and therefore I have done it in order to enable them to meet the bad times.

22,717. We have had it before us that in England, and perhaps in Scotland, the landlords have been a little slow to realise the difficulty the tenants have had in paying the rents owing to the greatly depressed prices of produce; if the landlords had realised that a little sooner perhaps some of their tenants would not have been in the same position as they are at the present moment?—I think it is the duty of the landlord to look into all these matters, and to be the first to make remissions, and not to wait until he is asked to do so.

His Grace the Duke of Richmond and Gordon, K.G., &c.
7 June 1894.

22,718. Regarding the Agricultural Holdings Act, I think your Grace said it has not been much used on your estates?—No, I think not; I do not recollect its being put into operation.

The Agricultural Holdings Act.

22,719. If a tenant farmer was leaving a farm and had laid out 300*l.* or 400*l.*, or 500*l.* on cakes and other good articles for feeding, would you deal privately with him or would you put him under the Agricultural Holdings Act?—I cannot say; it would be under the two valuers, and I suppose they would consider what was the right course to adopt. He could claim under the Act.

22,720. In April 1876, when you were in the Government, you said very plainly that the tenants' capital being invested in the soil should be given full protection, and was entitled to compensation?—Yes.

22,721. You have carried that idea out—not through the Act of 1883, but by private arrangement, I understand?—Yes, I think so.

22,722. I think the late Lord Beaconsfield spoke in the same terms; Lord Beaconsfield said, I think very justly, that the tenants should be put into such a position as to induce them to apply capital to the soil, which was good for all classes—you agree with that, I think?—Yes.

Official referees.

22,723. Would it not be as well if you were to refer these matters of manures and cakes under the Agricultural Holdings Act to an official referee—one man—to adjust the matter between the landlord and the tenant?—Practically it often comes to that; you get two referees and an oversman, and the oversman decides.

22,724. The evidence we have had in regard to this Agricultural Holdings Act is that the cost of arbiters and lawyers and other people, with the extra machinery round about, has so heaped up the expenses that the great majority of farmers, especially small farmers, are frightened to tackle the Act?—That is a misfortune, I think.

22,725. It has been proved before us here by several witnesses, and I would like to ask your opinion upon it, that one or two official referees should be named for each county, and appointed or sanctioned by the Board of Agriculture, as experts in dealing with the Act?—I should not think that was a good plan. I would much sooner leave it to the two people—the outgoing tenant and the incoming tenant—to name their own men and appoint the oversman.

22,726. What is the incoming tenant to do with the Agricultural Holdings Act; is not the compensation for these things between the outgoing tenant and the landlord?—I mean the outgoing tenant and incoming tenant.

22,727. But the contract is between the outgoing tenant and the landlord, is it not?—Yes, but the incoming tenant will pay certain things to the outgoing tenant, and those would be decided by the two referees and the oversman.

22,728. But the landlord would first have to put his obligation upon the incoming tenants' shoulders?—He must first. The incoming tenant cannot get in unless he makes some arrangement with the outgoing tenant.

22,729. The Agricultural Holdings Act says it is the value which has been left in the soil which the outgoing tenant and the landlord have to do with; but the incoming tenant is not a contractor at all, he knows nothing about it?—I have not worked it in that way.

22,730. Do you not think that is the reasonable and just way to work it; perhaps you have not considered it from that point of view?—No, I have not gone into that.

Law of hypothec.

22,731. Have you known any difference of opinion or any unjust actions through the abolition of the law of hypothec to either landlord or tenant in Scotland?—I do not know that I have, except that I have been obliged in some cases to fore-rent.

22,732. Have the tenants ever set very much against that?—No. I always thought it was a mistake to abolish the law of hypothec.

22,733. Have the tenants or landlords found any great fault in what you consider a mistake?—I think the abolition of the law of hypothec is rather against the smaller people, who could formerly take farms with a very small amount of capital and so get on in the world—I mean shepherds and men of that class.

22,734. Is it right for even the small class of men, such as shepherds, to take more land than they have capital to carry on with?—They can get their landlord to help them. I know the idea of a great many people in Scotland, and of some of the leading agriculturists at the time, was that the abolition of the law of hypothec was a good thing, because it prevented undue competition.

22,735. You seem to think that previously you were able to give the small farmer more credit for his rent?—Yes.

22,736. Who was his security? Was it not the general trader?—No. The man who went into the farm was enabled to do it, because the landlord trusted him.

22,737. But then the landlord was only trusting his interest on his capital, which is the land?—The landlord knows whether he is safe in doing it.

22,738. The landlord, as the man who put the farmer there, surely would know more about him than the general trader?—I beg your pardon; you mean that under the law of hypothec the general trader was left out.

22,739. Yes?—That is true, and that was one of the reasons given for the abolition of the law.

22,740. You know that the general trader both loses all the interest on his money and his capital which is really put on the land?—Yes, that is true.

22,741. If there were no great fault in abolishing hypothec in Scotland, why not abolish distraint in England at the same time?—I have told you that I was not in favour of the abolition of hypothec in Scotland, therefore I am not in favour of the abolition of it in England.

22,742. Do you not think the landlords create a false competition for the land on the credit system much greater than they would be able to get on the ready-money system?—I do not think so.

Condition of the tenants.

22,743. (*Mr. Giffen.*) Are your tenants generally doing pretty well for themselves with the abatements of rent that you have given them?—Fairly.

Abatements of rent.

22,744. Have the abatements of rent been about sufficient to enable them to make both ends meet and to live?—I will not say that, the remissions I have made I consider fair, and I have had no complaints.

22,745. You do not anticipate that you will have to make further abatements?—Upon my word I should not like to give an answer to that, because until I have to consider the question, and to go into it thoroughly, I should not be able to give an answer.

22,746. I notice that in these tabular statements which you have been good enough to supply the Commission with you still keep the rental up at the old figure. You have not reduced what is called the agreed rental?—No, there is the agreed rental and the remitted rental.

22,747. So that as far as the tenants are concerned they get it in the form of an abatement, but you still apparently are in hopes that the circumstances will be so altered that the agreed rental can again be paid?—Yes, we all hope that, but whether we are likely ever to arrive at that is another matter.

22,748. (*Mr. Channing.*) I should like to ask whether the figure 17,800*l.* is the agreed rental for the whole, including the land in hand as well as the land let?—Yes.

Expenditure on improvements.

22,749. (*Mr. Giffen.*) I should like to ask, with reference to the Scotch estates in particular, whether your attention has been called to column 14, which gives the expenditure on drainage and the allowances for grass seeds and other permanent improvements. I see there is a great reduction in that expenditure from about the year 1882; it very often was about 2,000*l.* annually before that, but now it has become a very small sum indeed?—That was because I had to remit so much money, I could not afford to burn the candle at both ends.

22,750. So that the remissions of rent take the place of this to some extent?—To a certain extent, if you put it in that way. When you reduce your rental by about 9,000*l.* a year it stands to reason that you have not so much money to lay out on improvements as if your rental was not reduced.

22,751. I merely wished to understand what the reason of the change was?—That is the reason.

22,752. I thought perhaps the drainage had come to an end for other reasons?—There is always some going on. I always hope that it will come to an end, but it never does.

22,753. I notice at the same time that the expenditure for new buildings, column 13, has gone on steadily increasing almost from the beginning of the period—that is, from 1872, is that not so?—That has been going on.

22,754. Increasing?—If the figures show it, it is so, but I should not have said so, because I have done a great deal in that since the year 1860, and therefore the buildings that are put up of course diminish the necessity for new buildings.

22,755. As far as I can make out in the first seven years, from 1872 to 1878, you seem to have spent about 27,000*l.* altogether on new buildings, and in the second seven years, from 1879 to 1885, about 40,000*l.*, and in the last seven years, from 1886 to 1892, about 53,000*l.*; the expenditure was very high during the last seven years, 1891 being the highest year. I thought perhaps there might be some special explanation of that?—At this moment really I cannot tell you. These figures have all been before me I know, but I cannot at this moment recollect what is the reason.

22,756. Perhaps you will send an explanation; I think it is rather interesting?—Yes, I will.

Duration of the depression.

22,757. Then according to this statement would it be true to say that depression in agriculture has affected you mostly since about 1883 or 1884?—From 1879.

22,758. In 1879 and 1880 it was very bad, but it seems to have been continuous since 1883 and 1884?—From 1879 up to the present time.

22,759. But your net income—I am looking at the Scotch property in particular—seems to have been larger in 1882 and 1883 than in any previous year?—The remissions began in 1879.

22,760. I am looking now at column 12, and column 12 seems to show that 1882 and 1883 were about the best years that you had in the whole series?—But I was remitting rent all the time.

22,761. But this is after the remissions were allowed off. Your net income was larger in those two years than it was in any other years of the whole series. My question was merely intended to bring out whether you would agree that the continuous depression seems to have affected you since 1884, and not so much before that year?—Possibly not so much immediately after 1879, but I should say continuously since 1879.

Tenure of holdings in Scotland.

22,762. (*Mr. Whitehead.*) Your Grace told us that there had been no changes or very few changes in your Scottish tenantry, I think I understood from you?—Hardly any except by death.

22,763. And many families have been there from generation to generation?—Yes.

Effect of the depression on Scotch and English tenants.

22,764. Has the depression in agriculture been much felt by your Scottish tenants?—Upon the whole I should say not, but they have had a great deal of depression.

22,765. Could your Grace say why they have not felt the depression so much as the Sussex tenants, for instance?—I should not say that they had not felt it. Possibly, I think, they work more themselves and with their families in a great part of the districts, and therefore the Saturday night's labour wage bill does not come so heavy.

Small holdings.

22,766. Would the holdings be smaller on the Scottish estates?—I have given you a list of them; they vary from 10*l.* a year to 600*l.*

Changes of tenancy.

22,767. I think we gathered that there were no really small holdings. May I ask if there have been many changes in your Sussex tenantry within the last ten years?—Not a great many, but some few.

Tenant's capital.

22,768. Have your tenants lost much capital in your opinion?—Yes.

22,769. May I ask since when chiefly?—I should say since 1879.

22,770. Do you think they have lost more capital and are more depressed than the tenants of other properties in Sussex?—That I could not say.

22,771. May I ask when the reduction of 37 per cent. from your rentals began to take place?—27 per cent. up to 1893 and 37 per cent. in 1893.

His Grace the Duke of Richmond and Gordon, K.G., &c.
7 June 1894.

22,772. Has there been any permanent reduction since then?—There has been no permanent reduction at all. They are all remissions since 1879.

22,773. Have there been large reductions of rent on other properties in your district?—That I do not know. I can only speak for my own property.

22,774. You do not know what other landlords have done?—No, I do not.

Condition of labourers.

22,775. May I ask what the position of the labourers is in your district?—Good, I should say; they have good cottages, good gardens, and very fair wages.

22,776. Has their position been improved within the last 10 years or otherwise?—I could not say it has been improved within the last 10 years; I think they have been very well off.

22,777. Does the rent of 1*s.* or 1*s.* 6*d.* per week for a cottage include the eighth of an acre garden which you say the cottages have?—Yes.

Poultry farming.

22,778. As to poultry farming, is there any poultry farming on your Grace's farms in Sussex?—No.

22,779. I believe it is carried on very extensively in some parts of Sussex?—Yes, up near Heathfield.

22,780. Has your Grace any experience with regard to it?—None whatever.

22,781. I think hops are not grown in any part of your district?—I am thankful to say there is not an acre of it.

Assessment of rates.

22,782. (*Chairman.*) Has there been any abatement of the assessments or reduction of the assessments for rates in the case of your tenants?—I really could not say.

22,783. The abatements of rent on the Goodwood Estate appear to have begun in the year 1884?—1879.

22,784. First in 1879, then they rose again; then the rents in 1883 and 1884 appear to have been collected without abatement?—That is so.

22,785. Judging from this table that you have sent us, in 1877 and 1878 the agreed rental was about 18,500*l.* and the rent actually received was also about 18,500*l.*; then in 1879 the rent actually received was only 16,700*l.* compared with 18,500*l.*, the agreed rental; then in 1883, according to this statement, the rent collected was 18,500*l.* again?—Yes.

22,786. And that was again the case in 1884, when the rent collected was the amount of the agreed rent?—Yes.

22,787. Then in 1885 it began to fall again?—Yes.

22,788. That is to say, the rent collected fell from 18,500*l.* to 17,600*l.*, and in the next year to 16,600*l.*; in 1887 to 15,800*l.*; in 1888 to 12,200*l.*; then it improved somewhat and for the next four years it was about 13,600*l.* or 13,800*l.*—a difference of nearly 4,000*l.* as compared with the agreed rent. But you do not think the tenants have had the advantage of that abatement of the rent in the reduction of their assessments?—I am not aware that they have.

His Grace the Duke of Richmond and Gordon, K.G., &c.
7 June 1894.

22,789. Do you consider that the abatements you are now making are likely to be permanent?—Upon my word I cannot say—it looks very like it.

Land in hand.

22,790. On the farms in your own hand you have made a profit?—Yes, on one I have, but the others I have had to take on in a very dirty bad state, and they will take some time to clean.

Rent on estates in Scotland.

22,791. (*Mr. Channing.*) In further explanation of these tables, I notice that while there is a reduction in the agreed rental on the Goodwood estates there is an increase in the agreed rental on the Scotch estates. What is the explanation of there being an increase in the agreed rental on the Scotch estates—the reduction in the other case is quite obvious?—I imagine that the increase in the agreed rental at that time was because some of the districts fell out of lease and the rent was increased.

22,792. That does not include the sporting rents at all—I think your Grace stated that?—No, it has nothing whatever to do with them.

Rates.

22,793. (*Chairman.*) What is the union in which Goodwood is situated?—West Hampnett.

22,794. Do you know whether in that union the Poor Law valuation has been reduced?—Yes, I think it has.

22,795. I have got a table in my hand showing the variations in the valuation in that union; apparently the valuation has gone down from 94,000*l.* in 1886 to 76,000*l.* in 1891?—Is that one of the tables that I put in?

22,796. No, it is not one you put in; it is one I had prepared at the Local Government Board?—They ought to know about it then; I cannot dispute that.

22,797. It shows a considerable reduction in the valuation of the union?—I think the Government grants that we have had have kept down the rates.

22,798. The poor rate apparently has, in spite of the reduction in the valuation, gone down from 2*s.* 1*d.* in 1884 and 1885, to 1*s.* 7*d.* in 1890 and 1*s.* 10*d.* in 1891, which shows a considerable reduction of charge upon the ratepayers of that district?—Yes.

22,799. I presume, therefore, that the Government subventions have been a considerable relief to the ratepayers?—They have been an advantage certainly.

The witness withdrew.

Mr. W. S. Ferguson.

Mr. William Scott Ferguson called and examined.

Mr. W. S. Ferguson.

22,800–1. (*Chairman.*) You are a farmer residing in Perthshire?—Yes.

22,802. How long have you been farming?—Over 30 years.

22,803. How many farms do you occupy?—Five.

22,804. What is the gross acreage?—About 1,030 acres.

22,805. What is the present rental?—About 1,700*l.*

22,806. What class of farms are they?—All arable.

22,807. Are you also proprietor of one of the largest chemical manure works in the Midland counties of Scotland?—Yes.

Condition of farmers.

22,808. You have, therefore, experience of the financial condition of the farmers of the district?—Too much.

22,809. What is the general condition of the tenant farmers in that district?—They are not well off, and not getting any better off.

22,810. When does that date from?—I should say about 10 to 12 years back.

22,811. Which class of farmers suffer most?—The large and the medium farmers have suffered equally. The sons and daughters of the smaller ones of course save the labour bill, and they do not lose money in the same way as the larger farmers, because their families do the farm work. We have not many large farms in Perthshire—at least comparatively speaking; what we call a large farm is 300 acres and over; a medium sized farm is 150 to 200 acres, and a small farm 100 acres down to 70 acres.

22,812. Anything below that is a small farm?—Yes.

22,813. There the family assists the tenant in working, and he does not feel the difficulty in wages so much?—No; many of the families do the work entirely so that they require no outside assistance at all.

22,814. Do they live upon the farm?—Yes, they live upon the farm. Many small farmers in times past have been able to put their sons in farms from this source; now many of these are large farmers in the district.

Reduction of rent.

22,815. Has there been any reduction of rent in your district?—Yes; I was just taking a note of the reduction on my own farms. One farm for which I pay 520*l.* now was rented in 1876 at 736*l.* 10*s.*; in 1872 the farm I live on was rented at 445*l.*, and my rent just now for it is 360*l.*; then again, another farm where I was born and brought up, my father's farm before me, which I now hold, I remember being 620*l.*, and now I have it at 320*l.* That is the largest reduction on any land I have. Then another one which was 220*l.* has been reduced to 180*l.* I was looking over some more farms in the neighbourhood and talking to my neighbours, and I find that the average reduction of rent in 15 years would be about 20 to 25 per cent. only.

Mr. W. S. Ferguson. 7 June 1894.

22,816. On some of these farms you have mentioned the reduction has been very much heavier?—Yes. I think my own reduction comes to more than 15 per cent.

22,817. One of them is nearly 50 per cent.?—Yes. The rent of that farm has been frequently reduced. The 620*l.* was an exceptionally high *grain* rent of many years ago. The fixed rent for several years was 520*l.*; this was subsequently reduced to 400*l.* and is now down to 320*l.* If we go to the other side of the hill to the Carse of Gowrie, the rents have been reduced much more. The clay land has come down far more than the black land.

22,818. When you speak of the average being about 15 per cent. —— ?—I am speaking about the black land.

22,819. What should you put the reduction of the inferior land, the clay land, at?—I do not know so much about the clay land over the hill in the Carse of Gowrie, but the reduction there has been, I think, from 30 to 50 per cent.

22,820. Your present rent appears to average more than 30*s.* an acre?—Yes, I have one farm at 50*s.*, and another at 44*s.*, and another at 34*s.*, and the one at 50*s.* is by far the cheapest. The highest rented one is the only one that is leaving money just now.

22,821. Have you got leases of those farms?—Yes.

22,822. When do they generally date from, different times?—My father's farm dates from Martinmas last, one three years back, and the one I live on 14 years back—my lease expires next year—and another in seven years, I think.

22,823. Have you had reductions of rent pending the leases or no?—I have only got one reduction of rent. I got a reduction of 10 per cent. five years ago, and I got that reduction for three years, and my rent is put up to the old rent again, the reason I assume being that the landlord in making a new bargain wishes to found on the actual rent instead of the reduced rent. I think that would be the reason of it.

22,824. That he has stopped making his abatements in order that he may make a better bargain with you?—Yes, I think so, to found on the old rent for making a new bargain.

22,825. (*Viscount Cobham.*) Is that just for the last year?—No, for the last two years. I am going in my second year to be put up to the original rent.

22,826. (*Chairman.*) Then you have had no, what I may call, permanent reductions of rent on existing leases?—I have never got a sixpence for anything but that referred to.

22,827. That is the only one?—That is the only one.

22,828. And that not a permanent one, but just for three years, an abatement for three years?—That was all.

22,829. Now in your district generally where leases have been in force have there been reductions of rent made or no?—Yes, on the same estate there have been reductions of from 10 to 20 per cent. and up to 30 per cent. according to the circumstances of the individual.

22,830. Pending the leases?—Yes.

22,831. In spite of the leases?—Yes. I understand that there was not an average reduction of rent made over the estate; every case was separately considered. Large farms got a larger reduction than small ones.

22,832. But you did not yourself get the benefit?—I got none. All that I ever have got has been that 10 per cent. off for three years.

22,833. Why was it that you were not favoured in the same way as the other tenants on the estates?—I suppose it was because I have other sources of income.

22,834. You did not depend wholly on your farm, therefore you were held to your bargain; that was it?—Yes; I think there must be something in it.

22,835. When the leases have fallen in has land been generally let at a reduction of rent?—Yes. Nearly all lands have been let at a reduction of rent, up to two years ago when the rents became firmer. The rents were not increased, we could not say increased, but they became firmer than they were.

Demand for farms.

22,836. Does that mean that there was a greater demand for farms?—Yes, a much greater demand.

Mr. W. S. Ferguson. 7 June 1894.

22,837. What was that due to?—That is a problem, I do not know; I think probably that farmers are beginning to find out that good land is worth working at a good rent when bad land is not worth having for nothing with the expenses of labour nowadays. A good deal of the second-class land is at a discount yet, I am speaking of our neighbourhood and generally in Perthshire. We have good farms, well fenced and well drained, and good buildings and all the rest of it, in fact, desirable farms, that we can find tenants for.

22,838. In the case of those farms, good land and desirable farms, two years ago the rents were firmer?—Yes.

22,839. And the more reasonable landlord could find tenants with capital?—Yes.

22,840. Were men of capital prepared to go in and take them?—Yes. I might mention with regard to this farm of Ballgavie, which I hold at 520*l.* for over 300 acres, I have had it for three years now; this is my third year. The old tenant wished to discontinue farming, and they could not get suitable offers for it at all, and he agreed with the landlord to keep it for five years at a reduced rent, and at the end of five years there was a scramble for it, everybody wanted it, even in the face of prices of agricultural products getting worse than they were before.

22,841. Even with the reduced prices for all the produce there was a scramble for the farm?—Yes.

22,842. Was that because the farmers of the district have learned how to adjust themselves to the new condition of things?—No, I do not think so. I think it is more on account of what I said that in bad times desirable farms and good farms are worth something, at least there is a chance of making something out of them, when with bad land there is no chance at all. I think that is the reason.

22,843. Are all your farms good land, or have you got some good and some bad?—They are all good. Of course, the land is not all good on the respective farms; there is bad land as well as good, but generally it is very good land.

System of cultivation.

22,844. Has much land been laid down in grass?—No; we have rather just been going in for a wider shift.

22,845. What does "a wider shift" mean?—That is laying longer in grass, but still ploughing it up, letting it lay probably two years longer in grass than usual, but saving labour and the manurial expenditure. We are finding it desirable to do that. In fact I have begun now to work all my land on the eight-shift system; that is three years in grass.

22,846. And the others?—Two green crops and three white crops.

22,847. Is that what farmers are doing?—A great many of them are.

22,848. And that saves in labour and saves in manure?—Yes, and keeps the farm in better condition at a cheaper rate.

22,849. Is it, do you think, due to that experience that there is a greater desire now to take the farms at the same rent?—No, I do not think it is on account of that.

22,850. Not?—I do not think so.

22,851. You find it more profitable to work the farm in this way than under the old system?—I should not like to say it is more profitable, but there is less chance of loss.

22,852. One would suppose that men who are going to a farm, and who take a lease at a given rent, and who are willing to bring capital upon it, expect to make some profit?—I think that most of them who have been taking land lately have just been expecting that the tide would turn in some way or other.

22,853. (*Viscount Cobham.*) But chiefly they diminish the labour bill, I suppose?—The chief thing in that is to diminish the labour bill, and, of course, the manurial bill. The manure bill is one of the heaviest items we have. By using cakes and laying down the land while in grass we do not need to buy so much manures.

22,854. (*Chairman.*) They save both in labour and in manure?—Yes.

22,855. Does that not help them to give the same rent?—It is with that intention it is done, but I would not say it helps us to make the rent in these times; it helps to save us from loss.

Mr. W. S. Ferguson.
7 June 1894.

22,856. (*Mr. Everett.*) In your two green crops do you include one potato crop?—Yes, it is this way; three years grass, oats, turnips, barley, potatoes, wheat, and three years' grass.

22,857. (*Viscount Cobham.*) What grass is it, rye grass chiefly?—A mixture of permanent grasses for the three years; rye grasses and clovers and permanent grasses.

Result of farming.

22,858. (*Chairman.*) I can understand these changes helping to make a less loss than you would otherwise do, but one does not quite understand why new men who come in with capital pay the rent unless they expected to make a profit?—They are not doing it.

22,859. I understood that new men of capital were coming in?—It seems natural, but still it is not the case.

22,860. Not the case, what?—That they are making any profit.

22,861. They are hoping to?—Living in hope; but they are not making anything of it. I should be very glad, indeed, if my balance in July shows that I have not made a loss; I take my balance every year in July. Of course it is difficult for a farmer to take a balance—but you can get an approximate balance pretty fairly, and I will be very glad, indeed, if I get out without loss, without counting any interest whatever on my capital. So those who have very little capital—and a great many of them are unfortunately, in that position—are in a very bad way indeed. I believe, and I know for a fact, that a good many farmers who have considerable holdings are in a very bad condition financially in our county of Perth.

22,862. Judging from your own case, the rent is still considerable; a rent of over 30*s.* an acre may be regarded as considerable?—Yes.

Particulars of witness' farms.

22,863. Offering a considerable margin for further reductions if necessary?—But I would like to explain that I have two farms within driving distance of Perth; I have one in particular that everything is sold off; it costs me 2*l.* 10*s.* an acre, and I can make a good profit by it any year. I do not care for agricultural depression there, because the cow feeders come from Perth and buy my straw, hay, and turnips, and I drive back manure. I can always make profit of that. Another one, the next dearest one, is within reach of Perth too, and I sell about half off it, so they are worth a good rent when the same land if it had not the same amenities, if it were five or six miles further out, would not have been worth probably half the rent.

22,864. How near are those farms to Perth?—A mile on one side, and two miles on the other.

22,865. Those farms which are six or seven miles off are not so favourably situated?—No.

22,866. How does the rent of those compare with the others per acre?—Very different. Probably one of the best—well not the best, but as good—that one that I speak of as being reduced from 620*l.* to 320*l.*—is a better farm than the one I live on costing me 44*s.* an acre. But, as I formerly explained, the 620*l.* rental was a high grain rent, and was exceptional; therefore, for purposes of comparison 520*l.* should be taken as the high rent, and 320*l.* as the reduced rent.

22,867. What is the acreage of that?—Close on 300 acres.

22,868. Then that is a little over 1*l.* an acre?—Yes.

22,869. That affords still a margin for reduction if it is not paying its way?—Yes.

22,870. When does the lease of that fall vacant?—As I have mentioned already, I only entered it at the last term. I took over my father's lease of that farm: it was where he lived, and died, and I took over the lease that he had prepared with his landlord two years ago. This is the rent fixed two years ago.

22,871. You were prepared then to enter into a lease for 19 years at that rent?—Yes.

22,872. Were there other applicants for the farm?—No; I merely entered upon my father's lease.

22,873. Your father was in possession; he made a new lease with his landlord and you took it over?—Yes, that is all; there was no competition for the farm.

22,874. (*Viscount Cobham.*) Does your landlord insist upon leases; is it the custom of the estate?—Yes.

22,875. (*Chairman.*) Generally in your district do leases continue to be the custom of the country?—Not so much as used to be—at least shorter leases.

22,876. But still leases?—Still leases.

22,877. What is the shortest?—Five years. I have a 19 years' lease of Ballgavie—that is my largest farm—and I have a break in it at 10 years.

Mr. W. S. Ferguson.
7 June 1894.

22,878. Have the difficulties of farmers led to the employment of fewer labourers?—Yes, in that way I speak of, by laying out more to grass and making a wider shift.

Reduced labour and manures.

22,879. What proportion of reduction has that made in the employment for 100 acres, say?—We will take it at 300 acres. On a 300 acre farm it would be a reduction of one ploughman and a pair of horses, with the attendant reduction of field labour as well.

22,880. What would it make it altogether—a reduction of two men to 300 acres?—No, about one man and a pair of horses, which cost fully 100*l.* a year to keep; then there is the reduction on carting manure and buying extra manures.

22,881. Then I understood you that there is a further reduction of labour in cultivating land, did you not say that besides the one man and the pair of horses reduction there would be a reduction of further labour in cultivation?—Yes, it reduces the green crop area by an eighth. Supposing a farm were in equal divisions and working it in eighths that would reduce the green crop area by an eighth; consequently there would be one-eighth less labour required for working it. But that is not the main reason. It is not on account of the labour so much that we go in for this shift as the fact that the land gets in better order and is in a better state of cultivation and you can do with less manures.

22,882. Therefore you save in that?—Yes. That is a greater saving than the labour bill, although the labour-bill is a saving as well.

22,883. What would you say is the total reduction of labour taking into account the ploughman and the reduced employment of labour for cultivating; does it amount to two men for the 300 acres?—No, it would amount to about 130*l.* probably.

22,884. (*Mr. Little.*) That includes horse labour, I suppose?—That is horse labour and hand labour as well.

22,885. Would it be something like a man and two-thirds?—No, a man and two horses.

22,886. That comes to 100*l.*?—Yes.

22,887. Then you say it is about 130*l.*; that 30*l.* would represent about two-thirds of a man's wages?—Yes.

22,888. Or a woman's wages?—Yes.

22,889. (*Chairman.*) You said that there was a saving in respect of manure on your farm of 300 acres?—Yes.

22,890. What would the saving be, in consequence of the adoption of the eight years' shift?—It is very difficult to say what it would be, because the land gets in a better state of cultivation, and the farmer does not need to drive so much solid or artificial manures for his green crops. It is most difficult to say.

22,891. You cannot form any idea what it would be; is it as much as 1*l.* an acre or what?—I could not give any figures for it.

22,892. A considerable saving?—Yes.

22,893. Taking that farm of 300 acres in which you say you have had a reduction of rent from 620*l.* to 320*l.*, you also save 130*l.* in labour?—Yes, compared with what I did spend.

22,894. The cost of a man and a pair of horses and other labour amounting to 130*l.* a year and also the value of the manure?—Yes.

22,895. (*Viscount Cobham.*) But you have diminished your production at the same time?—Yes, of course, you diminish your production of green crop, and increase the area of grass.

Foreign competition.

22,896. (*Chairman.*) What do you consider the depression to be due to?—Foreign competition mainly.

22,897. Low prices due to foreign competition?—Yes; there seems to be no doubt about that, I think.

Bad seasons.

22,898. You have not suffered from bad seasons in your district?—Not so much as other people have. We could not complain on that score. We have not probably had as genial seasons for the last five or six years as have been, but we could not complain on that score.

Prices.

22,899. What is the produce in respect of which the lower prices mainly affected your farms?—Mainly wheat and potatoes.

Mr. W. S. Ferguson. 7 June 1894.

22,900. Do you grow wheat?—A good deal. I always grow half of the greep crop with potatoes. It is not suitable for anything else—I mean in this respect that on our black lands you cannot take two turnip crops close to each other. We want to take two green crops in rotation and we cannot take two turnip crops, because there would be finger and toe in the one. We find the best cure for that is to keep a wide shift and keep one crop in potatoes, and although potatoes is not a profitable crop in itself, still we find on our kind of land it is the best preparation for grass.

22,901. Taking the average of years has there been a reduction in the price of potatoes?—Yes, for the last good number of years there has been a good reduction in potatoes.

22,902. What has been the reduction in price?—About 5*l.* to 6*l.* an acre, this year a great deal more.

22,903. How much would that work out in percentage?—I used to get about 20*l.* an acre for my potatoes in fairly good years, and for the last two or three years I have got from 15*l.* down to 10*l.* I do not think I will have over 10*l.* an acre this year for my potatoes.

22,904. They might have been exceptional last year?—They were cheap the year before too.

22,905. (*Mr. Elton.*) Is not there a sudden rise lately in the price?—Yes, quite so, but the stocks are all out. I fortunately, personally, happen to hold a few, but nearly all the potatoes are away. The rise happens when few have potatoes to sell.

22,906. (*Chairman.*) That low price was the low price of last autumn, I suppose?—Yes, and all through the season right up to the frost in the end of May which blighted the new crop.

22,907. Was that due to an exceptionally abundant crop?—I suppose so. I could not state. I cannot tell what it was due to.

22,908. It is not due to importation?—Yes, a good deal is due to that. I believe a good many potatoes come from the Continent and keep down the price in the early part of the year—keep down the price of the home stuff.

22,909. Is there not an export of potatoes from Scotland in good seasons?—We have had a good trade with America for two or three years in a way, but they have put up the duty to such an outrageous price. It is only when prices are very high on the other side that we can get the trade.

Duty on potatoes in America.

22,910. (*Mr. Little.*) There is a very heavy import duty in America, is there not, on potatoes?—Yes. Two or three years ago I think it was about 24*s.*, and we worked a good trade at that time. I understand just now it is nearly double that. I do not know the figures exactly, but I know it was put up considerably. That stopped the trade until recently when there has been a good trade with America in potatoes.

Cost of labour.

22,911. (*Chairman.*) Have you found labour to be dearer than it was?—Yes, about one-fourth dearer than it was.

22,912. As compared with when?—As compared with 20 years ago.

22,913. Comparing it with 10 or 12 years ago, is it so?—The price of labour has been gradually rising for the last 20 years. As compared with 10 or 12 years ago, a man who was receiving 25*l.* a year received 31*l.* or 32*l.* now, that is, of course, along with the perquisites, he gets besides.

Reduced labour.

22,914. That has occurred in spite of the fact that there has been less demand for labour?—There has been a less supply of good labour; we have not a sufficient supply of good labour, and we have great difficulty in getting good farm hands.

22,915. Apparently there has also been less demand for labour?—Yes, but the less demand does not amount to very much after all.

22,916. How is that?—It is only one man probably out of six or seven on these farms that have adopted this rotation, but we have not all done that.

22,917. With those who have this one man out of six or seven seems to be a considerable reduction?—Yes, if it was all over. I am only speaking for our own district, you see.

Condition of cultivation.

22,918. Has there been diminished production through insufficient capital on the part of the farmers?—Yes, but on the other hand there has been increased production by a number of farmers who have capital. They have been considering that the best way to meet bad times has been to get the land into as good a state of cultivation as possible, so that a great deal of the land in Perthshire at the present moment is in a better state of cultivation than ever it was before.

Mr. W. S. Ferguson. 7 June 1894.

22,919. What have they done; how has the better cultivation shown itself?—They have been driving more manure to it, using more cakes on it and draining and limeing it more, but principally the improvement is in using cakes and manures.

22,920. Has that been with good result or no as compared with the farmers who are going on the old system?—I would not like to say.

22,921. Have you formed no opinion upon the subject, whether the outlay of capital in manuring has answered or not?—I am not very sure, but during those bad years one would have done best to himself to have held in his hand and not put it on.

22,922. Are they continuing to apply the same extra amount of capital in the way of manure?—Yes.

22,923. In spite of the fact, as you say, that it is doubtful whether the results are satisfactory?—Quite so, waiting for a turn of the tide, I suppose, but that is the fact, and I am very doubtful whether they would not have been better in farming at less expense. Of course if things were to turn a little there can be no doubt whatever that the land in good cultivation and in good heart would give a better return, but I am certain, and I know from my own experience, that I would have been better during the last few years to have taken what was in the land and saved the expenditure on it.

22,924. Have you done that yourself, have you increased your expenditure on manure apart from the changes that you have made in the shift? Should you say that you have relatively increased your expenditure on manure in order to try and make the best of the land?—I have always gone in for high farming, and I have made no difference.

22,925. Have the other farmers in your district, who have not previously gone in for high farming, spent more money upon manures?—Yes, some of them have been doing it better. They have been thinking that that is the best way to meet the depression. But my opinion is, as I have already stated, that so far as has gone I think they would have made more money or lost less if they had held in their hand.

22,926. (*Viscount Cobham.*) Do you think they would have told you if they had made a little profit?—We know pretty well from each other how things stand.

22,927. (*Chairman.*) But they have not gone back to their older system?—No.

22,928. They still go on spending more capital?—They still go on keeping the land in a high state of cultivation. I would say that that applies to the majority of the farmers in our neighbourhood, although there are very many indeed who through insufficient capital and loss of capital have let the farms go down.

22,929. In those cases the land has been deteriorated?—No doubt of it whatever.

22,930. That would appear to be rather from continuing the old system, or have they expended less than they did before?—Not the old system—going back from the old system and having less money and letting the land get out of cultivation.

22,931. Spending less in fact?—Spending less and not devoting so much to labour on the land; letting it get out of condition generally.

22,932. In those cases the land has deteriorated?—Yes, there can be no doubt about it.

22,933. They have lost money still more?—A great many farmers have got into such deep water that I do not think there is any possibility of getting them out of it.

Restrictions.

22,934. Are there complaints in your district with reference to restrictions and methods of cultivation or the prohibition of the sale of certain kinds of produce?—There are complaints in regard to restrictive leases, but my opinion is that there is very little in it, because I think even although they had freedom of cropping most of them would crop not very much differently from the course laid down to them. There is more cause of complaint in regard to not getting freedom

Mr. W. S. Ferguson. 7 June 1894.

of sale. I think it is a very great hardship for a farmer, if straw is dear, or if turnips are dear, or if hay gets up to a good price, to find that he has a clause in his lease that he cannot sell any of those. I think that is a very great hardship.

22,935. Have the landlords removed these restrictions during those bad times or no?—In certain cases they have, but on most of the large estates they are pretty much the same.

22,936. (*Viscount Cobham.*) Are you under those restrictions yourself?—No, I would not sign a lease with those restrictions.

22,937. Your case is exceptional then?—Yes.

22 938. (*Chairman.*) Do you sell straw when straw is dear?—I sell it any time, but you must remember that most of my land is within reach of the town.

22,939. (*Sir Nigel Kingscote.*) You bring back manure when you sell out straw?—Quite so; but really on the whole I do not think that farmers far from a station and far from a town would do very much better even although they had freedom of cropping. They would crop, generally speaking, in the way that is laid down for them. Of course there may be individual cases of hardship, but I do not think, generally speaking, that it can be called a hardship at all.

The Agricultural Holdings Act.

22,940. (*Chairman.*) Do you think the Agricultural Holdings Act has been beneficial or not?—It has been a benefit, and it has been the recognition of a good principle; but we are beginning to get afraid to touch it.

22,941. In what way?—There are so many lawyers connected with it. Of course I heard what Mr. Clay asked the Duke of Richmond, and I quite agree with the suggestion he was speaking of there, that it would be far better for everybody concerned if representative practical men in districts or counties should be appointed under Government to arbitrate between the landlord and the outgoing tenant. I think it would be a far better system than the present, and far more satisfactory, at least, to the tenant.

22,942. At present both the landlord and the tenant name an arbitrator and they select an umpire between them?—Yes, but that does not prevent them from getting into the courts after all. I would like some means whereby you could prevent landlord and tenant from getting into court.

22,943. Surely if both landlord and tenant nominated an arbitrator, and those two arbitrators nominated an umpire between them it would not go into court, would it?—Sometimes it does. That is the way it is generally done with the outgoing and incoming tenant. Arbitration between an outgoing and incoming tenant seldom goes into court, but as far as we have seen yet there have been too many cases of compensation in court.

22,944. (*Mr. Elton.*) Surely they are only on points of law, not on quantities of compensation?—Still we get into court and run up expenses, but if it could be done on the same principle as an out-going tenant and incoming tenant, if a referee were empowered to settle the question, it would be better.

22,945. (*Chairman.*) But surely the great bulk of the cases are between outgoing and incoming tenants, are they not?—No, none.

22,946. None?—There are no cases under the Agricultural Holdings Act between the outgoing and incoming tenant.

22,947. Nominally it is against the landlord, but practically the money is paid by the incoming tenant, is it not?—Not that I am aware of. I do not know an incoming tenant who pays the bill. I have not known a case of that kind.

Official referees.

22,948. Your suggestion is that some Government Department should have the power of nominating practical men for the purpose of determining these cases?—Exactly.

22,949. And that there should be only one such man appointed; would you give up the practice of both landlord and tenant nominating a referee?—Probably there should be a few competent men appointed for each county.

22,950. At present practically three men have to do the work?—Yes.

22,951. One on behalf of the landlord, another on the part of the tenant, and then they select the third between them?—Yes; a sole arbiter would be far the best, I think. In fact we are going in very much for that in all references in connexion with agriculture; we appoint a sole arbiter.

Mr. W. S. Ferguson. 7 June 1894.

22,952. You are moving in that direction without an Act of Parliament?—Yes, in our private work.

22,953. Have you any other suggestions to make with regard to the Agricultural Holdings Act?—No.

"Improvements."

22,954. Are you satisfied with its definitions of "improvements"?—So far as I am personally concerned I have contracted myself out of them all, through the landlord's schedule.

22,955. Have you made a more beneficial arrangement by contract?—I do not say that; I do not think so either; but I have made a contract that is probably better understood by myself and will be less likely to lead to any difficulty.

22,956. What is the nature of it?—Everything is specified.

22,957. Is it an agreement which might be made general or no, or is it specially adopted only to yourself?—I could not say whether it might be made general or not. I think circumstances might alter cases. I could not say.

22,958. For a general rule do you think the definitions of the Agricultural Holdings Act are on the whole best?—I think the Agricultural Holdings Act is a good thing if it could be properly worked, and it is a recognition of a fine principle; but I would like to see it working better.

Ground game.

22,959. And the Ground Game Act?—That has been a good thing too.

22,960. Is that practically acted upon?—Yes.

22,961. The tenants have the power of killing the ground game?—Quite so.

22,962. (*Viscount Cobham.*) Has it reduced the number of rabbits?—Yes, considerably. Of course some landlords make a special reduction to their tenants on account of the head of rabbits and a number of landlords keep land in their own hand for that purpose to keep them away from the tenants, but as far as I know in our district there is no hardship that I hear of in regard to ground game.

Judicial rents.

22,963. Is there any demand in your district for judicial rents?—No.

22,964. Are you not in favour of them yourself?—I would not like to enter upon that question. I have always been accustomed to making my own bargains, and I would like to continue making them.

22,965. Is that the general feeling in your district?—I do not hear anything to the contrary.

Importation of foreign cattle and foreign breeding.

22,966. On the subject of foreign cattle what have you to say?—I have to say this, that the people in our district seem to have been running wild over this and thinking it would be a cure for agricultural depression, but my opinion is that it would not.

22,967. What would not?—The introduction of any foreign animals to our country. What we want more particularly in our district is to go in more for breeding our own stock. I breed and feed as many as ever I can. Of course I cannot breed all I require, but I breed as many as I possibly can, and I find every year that the ones I breed myself are far better and far more profitable. I very seldom lose money or fail to make a profit on the animals I breed myself. For instance, at the present moment I am selling Irish bullocks at 30*s.* the live hundredweight that I fed all the winter; and that is making no return whatever, they may be clearing their way, but practically that is leaving no return on their keep in the shape of profit; and I am getting as high as 40*s.* a live hundred-weight for my own home-bred crosses just two year olds. I have got as high as 23*l.* for two year olds home-breds this year, and I think that is probably the best paying industry we have in connexion with agriculture in our district. But as I say a great many farmers have given up breeding because they have got into their heads that this importation of cattle was to be a remedy for agricultural depression. But I distinctly hold that it is not the case. We have well-drained, well-fenced country and good buildings, and everything suitable for stock rearing, and in our district at least, of course some districts may be different, it would certainly be a cure in a measure for depression if the men would go in more for rearing their own animals of every description.

Mr. W. S. Ferguson.
7 June 1894.

22,968. When you say people are running wild with admitting foreign cattle, do you mean that in your district there is a great feeling in favour of admitting them free?—Yes.

22,969. Your neighbours have not followed your example then in breeding?—Yes, a great many of them have, but a good many are discontinuing the system of breeding, in the hope that they were to get cheaper animals from abroad and they have not got them. But the real movers in the case are not the farmers; it is those who are interested in sending them and selling them here. The farmer does not want them so much as they; they are pulling the wires, but the poor farmers are rising to the fly.

22,970. Apparently from what you say there are a considerable number of farmers who are influenced by these people, and who have made this demand, and, I presume, think their advantage would be in having free importation of lean stock; is that so?—I question whether the farmers have made the demand. So far as I have seen the farmers have been carried along with people who have other interests to serve.

22,971. It seems to imply that the demand comes, in the first instance, from certain of the farmers, but you think they have been put up to do it by other people?—I do not think it came in the first instance from the farmers: I have seen great meetings in our county for the purpose of advocating the introduction of foreign cattle when I knew, and it was very apparent, that the meetings were got up by the magistrates of Dundee, the Harbour Board of Dundee, and people who were sending cattle from abroad, and two or three salesmen. I asked the three principal speakers at one meeting if they had any experience of foreign cattle, and they had all to confess they never had fed one of them in their lives. I asked one of the principal speakers; he said: No I will stick to breeding, and he says that is what made him; the principal speaker advocating foreign cattle declared that in a public meeting. There seems no manner of doubt whatever in a mixed country it would lead to more industrious habits as well and keep medium farmers and small farmers more at home. The farmers in our district, these speculative men, run far too much to markets and sales. If the men who have reduced capital and feel the shoe pinch had to stay at home and look more after their work at home, and the rearing of their own home stock, it would be better. It is much easier of course going to market and buying them, but it does not pay nearly so well. That is my experience.

22,972. Then you think that one of the directions in which there is hope for farmers is that of rearing cattle more themselves?—I speak only for our district.

22,973. And your district is very favourable to the rearing of cattle?—Yes.

22,974. Further you think there should be an extension of this eight-year shift that you have spoken of?—Yes.

Reduction of rent.

22,975. And you also think there should be further reductions of rent?—That is the only thing we have in our own hands. We have no command over the labour bill, we have no command over taxes, and the only thing we have command over is the rent, so if we take the land too dear we have ourselves to blame. If we got a reduction of rent it certainly would help us.

22,976. You have got a considerable reduction of rent apparently. You think you ought to get more?—We used to draw more out of the land in some way, and the only manifestly apparent way of getting it is from the landlord.

22,977. In your own case where the average rent is about 35*s.* an acre there is still considerable margin?—Yes, quite so.

22,978. Then what are the prospects of getting the reduction if, as you say, other men of capital are ready to come in and offer the same rent?—Personally I have no prospects of reduction. I will not seek it because I will try to fulfil my bargain. But I may say that on one farm that I have my rent is 520*l.*, and the landlord refused 70*l.* more from another man; he did not take the highest offerer; if he had taken the highest offerer this man would have been at him for a reduction of rent at the present time.

Importation of foreign cattle.

22,979. (*Viscount Cobham.*) I do not quite understand an expression in your brief. You have had a meeting of the Highland Society of Scotland about the importation of cattle, and it was carried by more than three to one that free admission of foreign cattle would not improve the agricultural situation; and you go on to say "such "is not the opinion of the large majority of Scottish "farmers?"—I should like to explain that That was in reference to a statement by Sir John Leng in the House of Commons. Sir John Leng stated that the introduction of foreign cattle would be a great means of removing the agricultural depression, or words to that effect, and that feeders of cattle lost 5*l.* a head by not getting them in. He said that they made 5*l.* more per head off Canadian bullocks than they did off home ones. A gentleman at the board brought up this matter yesterday—Mr. Martin. He said it would not be right for the Highland Society to let this statement go unchallenged, and he asked the Highland Society, as representing Scotch agriculture, what was their opinion. Now I happen to be a director of that society, and I was at that meeting yesterday; and if they represent Scotch agriculture at all—and Mr. Gilmour knows, for he is a director of that society—that is our opinion.

Mr. W. S. Ferguson
7 June 1894.

22,980. That foreign cattle would not improve agriculture?—That foreign cattle would not improve the position of agriculture, neither is there profit to be got out of them as stated.

22,981. (*Mr. Channing.*) Was that generally stated or was it worked out in figures?—I cannot tell; there were figures given—the most outrageous figures I ever saw.

Leases.

22,982-3. (*Viscount Cobham.*) When you renewed the tenancies of your various farms, were you practically obliged to take leases or was it at your own option that you took them?—I could not have taken a shorter lease, but I could have got some breaks if I had wished. I could have got if I had liked a break probably at five years and another at 10.

22,984. But you have not done so?—I did not want it.

22,985. You were quite content to go on under the system of a lease?—Yes, because I hold that no man can do justice to himself or to his farm or his system if he thinks he might be removed at the end of five years.

22,986. Do you think that farmers in Scotland who are afraid of taking leases are now mistaken, and that it would be better for their own interest if they did take leases?—I do not know about that. If a man has made a bad bargain five years would be long enough.

22,987. Or one year?—It is a thing you must take your chance of. As I have already stated, there is no use in taking such a short lease of land—you must rather take your chance of it. At least that is what I would do. I have entered on one of my farms just now for 19 years without a break at all. That is the farm which my father was on. He had made a lease two years before he died, and when he died, just shortly before he was entering on his new lease, I took it over, so I have entered on a 19 years' lease.

22,988. You think that a man ought not to farm at all unless he sees his way to taking the good and the bad together for a number of years?—I say he must take his chance of the times if he wants to do justice to his farm and to himself as well. He cannot do that in five years.

22,989. Are all the farms on the estate on which you hold let on lease without exception?—Yes, the whole of them.

22,990. And is there good competition for them?—For some of them, for the good land, but principally for the good land; there is not so much competition for the bad land.

22,991. But the bad land alike with the good lets on lease?—Yes, it lets on lease.

Importation of foreign cattle.

22,992. (*Sir Nigel Kingscote.*) As regards the importation of foreign cattle, you have expressed the strongest opinion against it; has the risk of importing disease anything to do with that opinion?—No, I will not enter upon that question. I have dealt with it purely as a question of whether it would improve the agricultural position; I hold that it would do the reverse.

22,993. You do not wish to express any opinion about the disease?—No, but I have opinions about it.

22,994. You would rather not give them?—I would not like to enter on that ground.

Sale of cattle by auction.

22,995. As regards the sale of cattle with you, is that done by auction or by private contract generally?—By

Mr. W. S. Ferguson.

7 June 1894.

both, but too much by auction. There is too much gambling in cattle.

22,996. In what way?—In selling them so often at the auction marts. We have, probably as you are aware, the largest centre for the sale of cattle and sheep I suppose in Great Britain—at least in Scotland. A great deal of gambling goes on there, and even where there is no gambling it is quite possible for animals to pass through the salesmen's ring four or five times before they come to the butcher.

22,997. Who gets the worst of that—the farmer, that is the producer, or eventually the consumer?—I do not know who gets the worst of it, but the salesman always gets his commission.

22,998. Then what you mean to say is that in your opinion there is too much lost between the producer—that is, the farmer—and the butcher; there is a great difference in the price from one to the other?—That is not what I mean. If an animal has been sold at various stages of his life, five times we will say, before he reaches the butcher five commissions have come out of the farmers' hands and gone to the auctioneer. I have known them sold three times in a day at three different sales in Perth, and then there have been three commissions in one day out of them.

22,999. (*Mr. Little.*) In addition is there not a loss of flesh on these cattle every time they are exposed?—Yes, no doubt, with a loss on the railway carriage besides.

23,000. (*Mr. Giffen.*) What is the usual commission?—4*d.* in the £1.

23,001. (*Mr. Lambert.*) So much as that?—Yes.

23,002. (*Sir Nigel Kingscote.*) Is that the usual tariff?—I believe some large dealers have a special arrangement, but I have never heard of anything less than 3*d.* The usual charge for a farmer is 4*d.*

23,003. Does that include any market dues or tolls?—Nothing.

23,004. Simply the auctioneer's per-centage?—Entirely.

23,005. (*Mr. Lambert.*) Do the auctioneers free all market dues?—I do not think they pay any market dues, the railway companies do that.

23,006. The farmer does not pay them extra—in addition to the 4*d.*?—The farmer pays nothing but his commission and probably a small custom due, if he happens to be driving animals into the town instead of coming up by railway. The custom due amounts to very little.

Railway rates.

23,007. (*Sir Nigel Kingscote.*) Have you anything to say as regards railway rates; have they gone up or down in your part of the world for agricultural produce?—They have gone up. I have a statement here to show the local difference of rate for small farmers carrying tons to Perth from 10 to 12 miles out, but I noticed after I got this statement made out that my clerk has written on it that these rates have nearly all been modified, so I will not put the statement in. The railway companies, although making these rates their legal charge, have modified them all. I do not think there is so very much in it after all when one looks into it now. Practically it is dearer, but it is not much to count on.

23,008. Does that apply to goods or to cattle?—This applies to tonnage—to manures.

23,009. Or feeding stuffs?—Yes.

23,010. As regards the rates for cattle or sheep, have they increased or not?—They have been increased at the same ratio.

23,011. (*Mr. Channing.*) Can you state the ratio?—No, that is what I wished to do, but I see since I got this that the clerk says they have been modified by the railway companies. This statement gives the actual charge, but then it is no use to take advantage of that because the railway companies have given it us back.

23,012. (*Mr. Lambert.*) In your brief you speak of "railway rates by which foreign produce is carried so "much cheaper from sea-ports to centres than from "local inland stations"?—Yes; although I am not prepared to speak to that in detail or to give you evidence upon it, it is a pretty well-known fact that foreign produce is carried at a much cheaper rate from sea-ports to centres than we can get it from inland stations.

23,013–4. Have you any definite instances to bring before the Commission?—No, only one. A friend of mine was sending me cattle to London from Perth, and he found it was cheaper to rail them to Aberdeen, a distance of 70 miles, and re-book them there and send them back again.

Mr. W. S. Ferguson.

7 June 1894.

Laying land down to grass.

23,015–6. (*Mr. Whitehead.*) What are the grasses in the mixture of grasses used for the three years?—Mostly perennial rye grass, Italian, cocksfoot, and timothy.

23,017. You have cocksfoot?—Yes; we believe greatly in cocksfoot.

23,018. Could you give me the proportions?—I could give you the proportions of what I laid down a field with the other day; one bushel of perennial; a quarter of a bushel of Italian; the same of cocksfoot; and 2 lbs. of timothy, along with 6 lbs. of red clover, 6 lbs of white, 2 lbs. of alsike, and 1 lb. of yellow.

23,019. Do you find that the clovers are worn out at the end of the time or after two years?—All but the white clover.

23,020. So that you get a depreciation of the pasture at the end of the three years—a marked depreciation?—Under good cultivation it is not depreciated. If land is not in good condition it will be depreciated by the end of three years; but where it is kept in good cultivation in many cases the value of it has increased at the end of the third year.

23,021. (*Mr. Little.*) Do you mean the value of the herbage, or the value of the land?—The value of the herbage.

23,022. (*Mr. Whitehead.*) Does not the land become very foul and unworkable from the rye grass?—No.

23,023. Not after so long a time?—No, not where it has been well cleaned. Of course under three years grass the land must be well cleaned before the grass is sown down, but where it has been well cleaned, and in good cultivation, there is no difficulty with it.

System of cultivation.

23,024. Then it would come into wheat at the end of the grass?—No; after the grass it comes into oats, then after that turnips, then barley, then potatoes, then wheat, and then it is sown down again; or, according to the fancy of the farmer, he might begin with the wheat and end with barley.

23,025. Is that practice largely adopted in Scotland can you say, or only in your own district?—I think it is very much adopted all over the country.

Disease in turnips.

23,026. With regard to finger and toe in turnips, which you say would prevent you from growing two crops of turnips consecutively; have you tried any remedies for finger and toe?—I have tried lime and subsoiling; that is all I have tried.

23,027. Have you found lime efficacious?—Yes, in a certain measure; but the real remedy is a wide shift.

23,028. Is that always effectual?—Yes, always.

23,029. (*Mr. Lambert.*) Do you attribute it to over-cropping?—To the nature of the ground more particularly. With some lands again they can grow turnips much oftener than we can.

23,030. (*Mr. Whitehead.*) Do you consider that it is the absence of lime in the soil which makes finger and toe more prevalent?—It is a ticklish question. We are trying some experiments about it under the Highland Society, and I would not like to say. The only remedy I have is the wide shift.

23,031. It is a very important question, is it not?—It is a very important question, in fact if we had the question solved, we might at once get out of this speculative business of growing so much potatoes, which we cannot do just now, for we must grow potatoes for the sake of our rotation.

Cattle breeding.

23,032. May I ask you what breed of cattle you breed yourself?—I breed polled Angus Aberdeen cattle; I breed pure breds, but I am not speaking of them at all in connexion with mercantile cattle. The larger proportion of my cattle are crosses. I breed from 30 to 40 or 50 black polled crosses every year out of crossed cows, or Ayrshire cows.

23,033. You said you find them much superior to Irish cattle?—Yes, different altogether.

23,034. Are not the Irish cattle very good in these days?—No.

23,035. Are they not chiefly shorthorns?—They are no good at all.

Mr. W. S. Ferguson. 7 June 1894.

23,036. Your experience must be different from my own; in my county we find Irish cattle very desirable animals, and they have been vastly improved in the last few years?—I will tell you what I did. I bought fifteen Irish bullocks in the autumn, and I sold them the day before I left to come here at 19*l.* 10*s.*, and I put them in at 14*l.* They have been feeding all the winter; they have grown great, big, long brutes, and I have sold them at 30*s.* a hundredweight. They are not the quality of beef that we want at all. As I have told you, I am getting for my own little black ones 40*s.* a hundredweight.

23,037. (*Mr. Everett.*) Is that live weight?—Yes. We count by the live hundredweight now; it is the best way to count it.

23,038. (*Mr. Whitehead.*) You say your district is very well suited for breeding cattle?—Yes, very well indeed.

23,039. There are a great many districts in Scotland, are there not, which are not so suited, where cattle cannot be bred, in fact?—I think the bulk of Scotland, if you keep away from the Carse land, is equally suitable for rearing cattle.

23,040. The bulk of it?—I think so as far as I have seen.

23,041. Therefore there is no occasion to introduce Canadian cattle, or any other cattle?—None whatever.

23,042. You think it is a fact that the greater part of Scotland is suitable for breeding cattle?—Yes, I am sure of it. We breed the best cattle in the world, and of the best quality, and we get the highest prices for them.

23,043. And that is applicable to Scotland generally?—Yes.

The marking of foreign meat.

23,044. Have you anything to say with regard to the sale of imported meat as home meat—I see that is mentioned in your brief?—We consider it a hardship that possibly a Canadian carcase may be sold any day for a home-bred one. That is all I have to say to that. We consider it a hardship, and we think it should be remedied.

23,045. Would you suggest any remedies for that state of things?—The law ought to take it up, and see that no man sells foreign meat for home meat.

23,046. That it should be distinctly marked as such?—Yes; the only way to get at it is to have shops for both.

Leases and variation prices.

23,047. (*Mr. Giffen.*) You think that a lease for five years is too short, because it does not enable you to get the benefit of your system?—Quite.

23,048. But in having your lease for a longer period, do you not make some calculation of what prices will be; do you assume that prices are to be the same, or are to go up or to go down, or do you make no calculation at all?—I never form an assumption in that way of what prices will be in laying down my rotations, and I do not know anybody who does. I lay out the farm in divisions, as I think most suitable for general cultivation. I do not think anybody can lay down a rule for prices.

23,049. Would not the prices you are likely to get affect you in your estimate of what the profit from your lease is going to be?—Yes.

23,050. Supposing you thought prices were going down on the average 10 per cent., you would make a different offer of rent from what you would make if you thought they were going to be the same, or were going to go up 10 per cent.?—Yes; but suppose I got a farm with half of it green crop, in potatoes which are down in price, if I take the risk and responsibility of shifting that rotation, it takes me a number of years to get it altered, and then by that time potatoes may be up again.

23,051. Then you would make no calculation of prices?—No.

23,052. Then you think it would be impracticable to make any calculation?—I do; I do not see how it could be done.

23,053. But surely it must affect the prospect of the next ten years, whether agricultural prices are going to go up or not?—Yes; but you must farm on a mixed cultivation; you cannot grow crops continuously. I have grown one small field of barley continuously for 15 years, just as an experiment; but that is purely an experiment; and it has not been profitable. In laying down a farm you must go in with the customs of the district. I never thought about laying it down for any other system.

Mr. W. S. Ferguson. 7 June 1894.

23,054. Suppose that prices on an average were going to go down, that whatever you did you were going to have a less return in the next ten years than the present prices give, would that not affect your calculation in taking a lease?—Yes, in taking a farm certainly. Of course, in growing white crops you have the opportunity every year of making up your mind whether you are to sow wheat, or oats, or barley.

23,055. That is as between two different articles?—As between three different articles.

23,056. Supposing they are all going down or going up, as the case may be?—If they were all going down you would not be any better, because you would have to sow one of the three—for the sake of your rotation you must put in one of the three.

23,057. You must make a calculation, when you take a lease over a considerable period, what prices are going to be—that is one of the most essential points, surely?—No, I always just look at it in the aggregate.

23,058. Then you have no calculation just now to offer us as to what the course of prices is likely to be in the next few years?—How can I?

23,059. (*Mr Clay.*) To follow up that argument, I suppose you have first to take your chance of these three cereals like other people?—Exactly.

23,060. And if wheat, as it is just now, looks to be a very bad paying article, you would grow less of it and a little more of the corn which is of a higher value?—That is exactly what I have done this year. I have not a third of the wheat I used to have; I have put in oats and barley instead.

23,061. If a farmer were to jump up and down speculating on the better price of cereals he would get very far adrift?—Yes, you are tied to the green crop. As I have already pointed out, you are tied to potatoes, because you cannot put in turnips where turnips have been before, or to beans probably, but we do not grow beans.

System of cultivation.

23,062. Your object in having the three years of grass is to improve the condition of the farm by the use of cake?—Yes.

23,063. That is the cheapest mode of conditioning the land, is it not?—Quite so.

23,064. Thereby you will save; but you did not condescend to a figure when the Chairman put it to you?—No, I cannot.

23,065. You will save on the green crops about 1 cwt. or 2 cwt. of manure, will you not?—You would save more than that.

23,066. If you save 2 cwt. of manure at 5*s.* 6*d.*, that is 11*s.* per acre?—Yes.

23,067. That is a considerable saving, is it not, over a green crop?—Yes, but you lose your crop again.

23,068. What do you consider in money value you save by running your farm with the three years of grass?—You save, in the first instance 120*l.* in labour, taking a 300 acre farm, and then you have a corresponding saving in manures.

23,069. To what extent—that is what I put to you?—If it is an eighth of your green crop you will have an eighth less of green crop break.

23,070. You say, in the first place, you save from 100*l.* to 120*l.* for labour and a pair of horses?—Yes.

23,071. Then you save a woman or so?—Yes.

23,072. Or a boy or two?—Yes.

23,073. Amounting to what?—I take it in the aggregate at 130*l.*

23,074. Then you save 2 cwt. of manure?—I give my turnips about a ton an acre

23,075. Of what?—Of phosphatic and other manures.

23,076. What money value do you put that at, because that is what we want to be at?—My turnips cost between 4*l.* and 5*l.* an acre in manure; that is where I grow them without dung and with artificial manure alone.

23,077. What would be the money saving per acre?—You have all that saved at any rate; but then, of course, you want your crop. It is difficult to tell what the saving would be in the end.

23,078. Cannot you give it a name; would you save 200*l.* all over on your labour and your manure account?—It would be an advantage of 200*l.* I think to a farm of

Mr. W. S. Ferguson.
7 June 1894.

that size, at any rate in regard to the general cultivation, and the getting it in good order at a cheaper rate.

23,079. (*Mr. Lambert.*) Then what would you put the value of the crop at that he would have produced had he spent this 200*l.*?—The extra crop would be worth probably 50*l.* to 60*l.*, but that is not the way I would look at it all. This is a thing that cannot be well reduced to figures. It is the general working of the land that I look at—working with a less expensive shift, and lessening the labour and manure bill, and saving your pair of horses. I am looking at the thing generally, but it is not satisfactory to reduce it to figures.

23,080. (*Mr. Clay.*) At the same time when that land in three years is ploughed up again, it works freer and is more pliable for cultivation, is it not?—With us it does not matter for that because it is always in that condition, so it makes no difference for that.

23,081. But there are poorer lands further up in the hillside away from you which are greatly benefited by three or four or five years grass?—Yes, greatly benefited.

23,082. Thereby the land becomes freer to work?—Yes.

The Agricultural Holdings Act.

23,083. With regard to the Agricultural Holdings Act, I think you agree in its principle?—Yes.

23,084. But the variation of procedure under the Act is expensive?—Yes, and risky.

Official referees.

23,085. You see no use in employing two men as arbiters, and then an oversman, where one official referee would do?—Quite so.

23,086. Would you have an official referee in each county to be named by the Government?—An official referee with power in difficult cases to call in one responsible person. He should be empowered to get advice from a neighbouring referee; in ticklish cases the responsibility should all be thrown on one man.

23,087. If it happens to be a point of law he can take counsel's opinion on that case and decide accordingly, can he not?—Certainly.

Claims and counter-claims.

23,088. The Chairman asked if you had any other matters to bring forward. In Scotland I think we have four months for the tenant's claim, and a shorter time for the landlord's claim; would you propose that the claim should be given in on the same day?—I think that would be reasonable, although there is not much in it at any rate.

23,089. Is there not something in this; when the landlord sees the tenant's claim he is apt to make one himself?—Yes, there might be that.

23,090. So that if both were on the same footing —— ? It would be manifestly fairer, no doubt.

Cattle breeding.

23,091. Regarding the breeding of cattle; the demand for cattle could be met, I think you very justly said, by breeding more cattle?—Yes.

23,092. If a tenant was breeding 20 per cent. more, and feeding 20 per cent. more, would not the supply and demand equalise themselves?—Yes; breeding 20 per cent. more, and feeding 20 per cent. less.

23,093. Would you not think the tenant farmer now has got rather—I do not say lazy, but something like it—that he does not go in for the breeding as he used to do in the old days?—That is what I emphatically say and think. It is the great cause of complaint that we have against our farmers in our neighbourhood.

23,094. If the farmers were to remain more at home and went less to market that would be more profitable?—There is no doubt of it, but you would get blackballed if you said so.

23,095. The home-bred cattle is of 20 per cent. more value than these Irish cattle, I think?—That is the absolute fact. I sell all my cattle by the live weight now, at least I do not actually sell them by live weight, but I know the live weight. In the case of all the cattle I sell I get the live weight sent to me by my man so that I know actually what we are selling at. I know there has been 10*s.* difference in the live weight of Irish bullocks, and of my own home-bred ones this year taking them all round.

22,096. Breeding cattle and feeding them is better than buying Irish cattle for paying the rent?—Yes.

23,097. Or Canadians?—Yes. I have never been wrong with breeding and feeding cattle.

23,098. (*Sir Nigel Kingscote.*) Would you like to see all cattle sold by weight?—Certainly; distinctly.

Mr. W. S. Ferguson.
7 June 1894.

23,099. (*Mr. Channing.*) Compulsorily, by law?—Yes.

Sale of live weight.

23,100. (*Mr. Lambert.*) Would you make it a law that no man should sell any cattle except by weight?—I would not say that. I would not like to interfere with people in that fashion.

23,101. That is the substance of your former answer?—I would not like to interfere with individuals in that fashion. My answer more particularly referred to public sales.

23,102. (*Sir Nigel Kingscote.*) Do you think it would be to the advantage of a tenant farmer if cattle were sold by live weight more than they are at present?—It would be the fairest plan. Since I have begun to know the live weight of my cattle when selling them I would not like to do without it, because it gives me a guide to the value of my animal better than I ever got before. Even the best judge is many a time deceived with the weight of his animal. I think the best argument in favour of selling by live weight is that the cattle buyers are very much against it.

The law of hypothec.

23,103. (*Mr. Gilmour.*) I suppose one of the reasons of these cattle passing through the mart so often is that the auctioneers are really advancers of money to a great extent to the tenant farmer?—Yes. That is another thing I would like to say in regard to the law of hypothec. I heard the Duke of Richmond speaking about that. Probably the law of hypothec gave an unfair advantage in a certain way, but its abolition has certainly been a disadvantage to the farmers. I was better off under the law of hypothec than ever I have been out of it. In fact if it had not been for that law of hypothec I do not think my father would ever have got a start, because he started with only 100*l.* Another thing, we never know just now when a farmer's property belongs to him. Since the abolition of the law of hypothec the whole stock on the place may belong to the auctioneers. On one occasion, not very long ago, I was valuator of a bankrupt estate and I valued 200*l.* worth of bone meal that had been delivered a fortnight before by myself. The auctioneers came and took away every beast in the place and they had been there for 10 months. Now under the law of hypothec that could not have been done. So that the removal of the law of hypothec has not been an unqualified benefit.

23,104. (*Mr. Clay.*) Are these not exceptional cases?—Fortunately they are exceptional cases because so many of the farmers have not gone to the wall yet; but it is the fact that we do not know whom the stock belong to.

23,105. Was it not a known case before that the landlord could take that bone and manure and leave the general trader out in the cold?—That is quite true, but then you had better means at that time of knowing how the farmer stood than you have now. You may think him a wealthy man with all his fields covered with animals ostensibly belonging to himself, but perhaps not a beast belongs to him.

23,106. Is the general trader not entitled to that protection, in justice to all parties?—The justice of the case would be that no transaction of the kind should be done unless it is published.

23,107. (*Mr. Gilmour.*) Is it not the fact that in several parts of Scotland just now there is very keen competition for farms?—That is so.

Reduction of rents.

23,108. In that case how do you expect to get a reduction of rents from landlords if that is one of the remedies for the depression?—Farmers are not a business class of men as a rule; they go and offer any rent for land with the hope that they may go to the landlord in a few years complaining, and that they will get it down then.

23,109. Then I suppose in that case the only antidote to that would be for landlords now to refuse all reduction of rents on leases commencing at this time?—That would be the business way to look at it.

23,110. Do you think that would work its own cure?—Yes, it will ultimately no doubt. But landlords are taking good care now, they are not letting their farms to men of straw; they like to see what kind of banking account farmers have before they give them a good farm.

Freedom of sale.

23,111. There are many cases, as I daresay you know, where they have freedom of sale in your neighbourhood,

Mr. W. S. Ferguson.

7 June 1894.

and where men can do what they like with their land?—Yes.

23,112. Are those men in a better position than those tenants who have not that privilege?—Yes, undoubtedly; not from that cause alone, but because where they have freedom of sale the amenities are better as a rule, and they have the market at their hand. As I was explaining before, although a great many men have freedom of sale, yet if they are far from a station and far from a town it would not benefit them so much.

The Agricultural Holdings Act.

Official referees.

23,113. You were speaking about one umpire dealing with the matter under the Agricultural Holdings Act, and I judged that you went a little further than some. The idea has chiefly been to leave it, I think, to one umpire. Of course any man can consult a neighbour upon any question privately, but would you have it that there should be two men called in to decide these matters?—No, one should be held responsible; but in ticklish cases with another to work with him you have seen many a case that you would not like to settle on your own responsibility without consulting someone else. However, if the umpire had the power to get information from anywhere that would meet it.

23,114. Naturally every man who takes up a thing is quite entitled to go and ask for any advice from any professional gentleman or friend of his, I suppose?—Yes.

23,115. Would that meet your case so as just to have the one umpire?—Yes, it would. When I spoke of advice I thought of how I would probably act myself; I was looking at it from the point of view that if I had a ticklish case to deal with I would consult somebody who knew as well as I did, in order to confirm my opinions.

23,116. But those questions that would be referred to you, except perhaps legal questions which might be ticklish, and upon which I understand you would be quite willing that there should be some appeal ——?—My opinion is that a sole referee should take whatever legal or other advice he considers necessary and decide accordingly.

23,117. On matters of fact, if you were nominated by the county council, you ought to be perfectly competent to deal with them?—Quite.

23,118. Do you consider the county council would be the right party to nominate those gentlemen in the district?—I do not know who would be the best; probably they would. The county council is the most representative body, but that is purely a matter of detail which I would not make suggestions upon.

Valuations.

23,119. In making valuations under the Agricultural Holdings Act, have they been carried out upon the principle that it was the value of the improvement to the incoming tenant that was allowed, or have the valuations been chiefly based upon the expenditure?—Both, in a certain measure, but mostly on the expenditure.

23,120. The other basis has not been found very workable then?—No, it has not been found very workable.

23,121. Have you been able to separate the inherent capabilities of the soil in dealing with that matter as a valuator?—No.

23,122. And you have not taken that into account?—No; knowing the holding, I have taken into account a general improvement, but that is not very satisfactory either.

23,123. (*Mr. Little.*) Knowing the soil, I presume?—Just general improvement—an indefinite general improvement, which is not very satisfactory on the whole.

Rates.

23,124. (*Mr. Gilmour.*) Of course, where you have had reductions and abatements the tenants have had the benefit of them in the rating?—Mostly.

23,125. Have you any change to propose?—I think the tenant farmer suffers a hardship in regard to his rates. I pay in rates on my whole holding about 100*l.*; that includes the whole assessments for consolidated rates, poor rates, &c. Now a great many of my rich neighbours who do not have farms, and have larger establishments and all the rest of it, only pay on the rental as well. To charge a farmer on his rental for income tax is not fair. I tried to get it back once, and got a reduction for three years, but it is not worth the candle after you have gone to all the trouble of getting it back. We feel it a hardship to have to pay income tax for an income we have not got. I think the farmer is not properly rated. Because his rental is beyond the sum that is allowed to be taxed for income tax, that is no proof that he has an income or that he should pay income tax.

Mr. W. S. Ferguson.

7 June 1894.

Poor rates.

23,126. Have you ever looked into the matter with a view to ascertain what proportion of the inmates of poor houses have been connected with the agricultural interest?—I have never looked at it particularly, but as a member of the district lunacy board I know that a very good proportion of them come from the rural districts.

23,127. You are talking of the lunatic asylum?—Yes; they come from the agricultural population.

23,128. In Perthshire?—Yes.

23,129. But I mean the poor that are paid for under the poor rates; the inmates of the poor house, not of the asylum. As a rule, are those purely employed in agricultural pursuits the chief inmates of poor houses?—No, certainly not.

23,130. In that way you would look upon it as hard that the land should bear those poor rates altogether?—Yes. I will not speak from a landlord's point of view, I am only speaking from a tenant's point of view; I hold that in regard to poor rates and school rates, and all those consolidated rates, the tenant farmer is unjustly taxed, being taxed on his rental. There should be some other method of taxing, because now he pays more than his proportion compared with what other people pay.

23,131. (*Mr. Lambert.*) Where do the inmates of the poor houses come from if they do not come from the agricultural districts?—The villages.

23,132. What operations are they engaged in?—They are weavers and people of that description.

23,133. You mean people engaged in manufactures really?—Yes.

Malt tax.

23,134. (*Mr. Gilmour.*) Have you considered the question in regard to the repeal of the malt tax, and the effect that it has had upon the price of good barley in Scotland?—It has had a very great effect on our barley growing district. Whether it is due to that or not, as soon as it was repealed the barley fell 10*s.* a quarter, and has never got up again.

23,135. (*Mr. Everett.*) Did not wheat and oats fall also?—Not through that; the oats have not fallen.

23,136. What makes you say it is through that that the one grain has fallen, when the other grain to which that would not apply has fallen still more?—It was immediately on the repeal of the malt tax that the barley fell.

23,137. And the wheat fell also a great deal more, did it not?—The wheat did not fall at that time.

23,138. I think you will find it did and much more?—Of course, the one was due to one cause, and the other was due to another; one was due to the repeal of the malt tax, and the other to foreign competition.

23,139. (*Mr. Gilmour.*) You are a member of the county council of Perthshire, I think?—Yes.

Small Holdings Act.

23,140. Has that council put into working the Small Holdings Act?—No.

23,141. Because why?—I suppose it has never been required.

23,142. There is no demand?—There is no demand for it, as far as I know.

23,143. (*Mr. Little.*) You said you had contracted out of the Agricultural Holdings Act; did you mean that your agreement compensates you for improvements in the third part of the schedule?—I have a schedule of compensation.

23,144. I do not know whether your Act is the same as ours, with the first schedule divided into three parts?—Yes.

Agreement for compensation.

23,145. You have made an agreement for compensation under the third part?—Yes.

23,146. But not under the first and second?—No.

23,147. You have not contracted out of the Act as respects them?—No; it is just the proportion that is to be allowed.

23,148. You prefer a definite scale of compensation to the risk of arbitration?—Quite so.

23,149. Do you think that the farmers generally are better satisfied with that?—I think so; most of them are adopting it in that way.

Mr. W. S. Ferguson.

7 June 1894.

'Inherent capabilities of the soil."

23,150. You said, I think, that you did not take into account the inherent capabilities of the soil; or that there was a difficulty in doing so?—I do not know what that means.

23,151. Would you say that the application of lime to all descriptions of soil was of the same value, or that it lasted for the same period?—Lime is of value to any soils that I have had anything to do with.

23,152. Is it of the same value to all soils?—No.

23,153. Does that not introduce the question of the inherent capabilities of the soil?—Yes, surely.

23,154. Therefore it must come into the calculation?—Yes.*

Labour. Decrease of rural population.

23,155. The Chairman was asking you how it was that the price of labour or the cost of labour had not diminished much, though you had altered the system of cultivation; is it not that the wage earners, the labourers, have decreased to a greater extent than the decrease of employment?—When trade was good the good men with large families who used to be on the farms went to the towns; their families grew up, and probably part of them went to employment in the cities, and part of them came back; but they were not good labourers when they came back.

23,156. The decrease in the number of labourers began before the changes in farming, did it not?—Yes, distinctly.

23,157. They distinctly decreased in number before the farmer had begun to reduce his labour?—Quite so. The alteration of system has nothing to do with the scarcity of labour to my mind.

23,158. The depopulation was not due to want of demand for labour, but the change in farming was due to a deficient supply of labour?—I would not like to say that the change of farming has been due to the want of the supply of labour.

23,159. Well, to the increased cost of labour?—Quite so.

23,160. You altered your system of farming because of the cost of labour?—Yes, in a great measure.

23,161. And that cost is increased by the decrease in the number of hands?—Yes.

23,162. Therefore, the change in farming is, to some extent, due to the decrease in population?—Indirectly if you count it in that way.

23,163. The decrease in population is not a consequence of depression in farming, but the alteration in the system of farming is, to some extent, due to the decrease in population?—Yes, if you look at it in the way of increasing the price of labour; but that is looking at it in a very abstract kind of way.

23,164. The population of your county has not decreased much, has it?—I think the opposite; I think it will have increased.

23,165. I have some figures here which show the population in 1871, 1881, and 1891, and which give the village and rural population in 1881 and 1891. From those figures I see that the number of labourers has decreased very much more than the whole decrease of population even in the village and rural districts; that is, that the wage earners in agriculture have decreased in greater number?—Are you speaking of Perthshire?

23,166. Yes?—That the labourers have decreased more than the population?

23,167. Yes?—I would not be at all surprised to hear it.

23,168. Would that not show that it is not so much a depopulation as that the population is going to other work?—But that is depopulation—they are going to the towns.

23,169. Suppose it is shown, as I think I could show you, that the rural population of Perthshire has decreased by only about 2,500 people, while the labourers have decreased by 3,500; that would rather show that the people had transferred themselves to some other employment than that they had gone away?—There is no other employment in the rural places. They go to the cities. For instance, where I live a great many of the people who live in the small villages go to Perth to work, and we have great difficulty in getting farm labourers even within a mile and a half of the city.

Mr. W. S. Ferguson.

7 June 1894.

23,170. The whole decrease of the rural population of Perthshire in 10 years is only 2,598 persons?—That would go towards proving your contention that they are going to some other employment instead; but, at any rate, wherever they are going, we cannot get them.

Rates.

23,171. Have you in your neighbourhood any system of graduation of rates or of valuation for rating purposes?—The rent of course is the main guide.

23,172. In some parts of Scotland property is classified and rated at different rates according to the nature of the property?—Quite so, the assessor does that; there is an assessor in the county for the purpose, and he assesses the value of it.

23,173. Is that so with you?—No.

23,174. Not in rural districts?—Not in agricultural holdings.

23,175. In some rural districts, it is the case, is it not?—Not with us as far as I am aware.

23,176. You do not know a district where that system prevails?—No.

23,177. (*Mr. Gilmour.*) Is it not the case that in connexion with the public health there are classifications and reductions given which vary it?—Not as far as I am aware of in agricultural holdings.

23,178. (*Mr. Lambert.*) There are?—Not on farms.

23,179. (*Mr. Little.*) But the rates are divided between the landlord and the tenant?—I think so. I pay the half, I understand.

23,180. And the landlord pays half?—There may be rates that the landlord pays that I know nothing about; but I understand that the half of the consolidated rates and the half of the poor rates, and the half of the school rates I pay.

Loans by auctioneers to farmers.

23,181. (*Mr. Lambert.*) You said just now that auctioneers had advanced a considerable amount of money to farmers; is that the general case?—I am afraid it is too general, and is getting more so.

23,182. Have they advanced money to some good farmers?—A farmer who is able to see his way would not need it, and he would rather be out of the hands of the auctioneer.

23,183. I mean to say some industrious men, frugal men—have they too been obliged to seek advances from auctioneers?—It is possibly the case. I believe it to be the case.

23,184. What kind of men would have these advances?—Men who have been getting hard up.

23,185. How have they got hard up?—Through agricultural depression.

23,186. Is it owing to their own unthrifty habits, or what cause is it owing to?—I should not like to say that a man who has been unfortunate and has had to borrow from the auctioneer was a man of unthrifty habits; although in some cases it is partly due to that cause, and some are men who have not probably had sufficient capital to start with. One great error, no doubt, with farmers generally, has been that they were too ambitious when times were good, and took more land than they had capital to go on with.

23,187. Is there any other cause?—For what?—for their misfortune?

23,188. Yes?—I have stated that some of them may have been improvident; and some of them may have been living above their means.

23,189. Is there any other cause than improvidence?—Improvidence and misfortune and bad times.

23,190. Are their outgoings too much for their incomings?—They must live, and they have no income.

23,191. Do they get nothing out of the farms?—Not a 6*d.*, I warrant you. I warrant you that at the present moment many men are going back; men who have to pay interest on any capital just now must be getting deeper into the mire.

23,192. Usually a man lives before he pays any rent?—I do not understand that exactly; of course he lives.

Rents.

23,193. Do you think the farms in your district are rented too high?—If I say yes, which is the fact, then farmers are themselves to blame.

* With reference to Questions 23,150-4, the witness subsequently wrote as follows:—"I do not agree with the conclusions I have here committed myself to. Liming, draining, and manuring land improves it in degree as the land requires it. I call this 'land improvement,' but 'inherent capabilities' is to me an unintelligible term."

Mr. W. S. Ferguson. 7 June 1894.

23,194. Is it the fact that they are rented too high?—It is the fact that they are too high.

23,195. And yet you said just now that there was a considerable demand for farms?—Yes, exactly.

23,196. Then one farmer bidding against another is apt to give a farm an artificial value or to raise it to an artificial rent?—The present position of agriculturists will not explain it at all. In the face of these bad times the increased demand for farms at certainly not any less rent than when times were not quite as bad will not explain it at all; I cannot give you any explanation of it.

23,197. My point is this: presuming that five men are bidding or struggling for one farm that is apt to raise the price for the rent of that farm beyond a fair rent?—Yes.

23,198. Therefore some farmers may get into difficulties owing to having to pay too much rent?—There is no doubt about that.

23,199. You think that land is over-rented, and that that is caused by competition for farms?—You speak about being over-rented, but I know many farms now where the rent would not pay more than the outlays that have been made on that land for draining, fencing, and building.

23,200. That is not my point; I am speaking from a tenant's point of view?—As far as a return goes in such land it would be too dear this year although you had it for nothing.

23,201. Of course rent is usually considered to be the profit after all the outgoings have been paid away; are the farmers paying more than than they can afford to pay at the present time?—Surely they are. There is no manner of doubt about that whatever.

23,202. Have you thought out any remedy for this state of affairs beyond getting an adequate reduction of rent?—No.

23,203. You have not?—No.

23,204. May it not be the reason why some farmers get into difficulties that they are paying too much rent?—Yes, there is no doubt of that.

23,205. Does it make any difference to the tenant how much rates he pays?—Yes.

23,206. Does he not take that into account when he takes his farm?—He may take his farm with reduced rates, and they may get up during the interval. At some of my places the rates have got up double since I took a farm. One farm was transferred to another parish when the one it was in had no poor rates at all, and now it is transferred to one with heavy poor rates. These are contingencies that one cannot consider in making a bargain.

Security of tenure.

23,207. You attribute a good deal of importance to fixity of tenure—that is security against being turned out capriciously?—I do not attach much importance to what is generally called fixity of tenure.

23,208. I do not mean that; I mean security of tenure?—I do not see how any practical farmer can work his land to any advantage whatever from year to year, or even at a five years' notice. He would need to have it for a longer time, and take his chance of it.

Compensation for disturbance.

23,209. If a farmer was capriciously disturbed—that is, if he were evicted from his farm, would you give him compensation for the loss which is occasioned by such removal?—You would try to arrive, certainly, in common fairness, at what you considered the surrender value of what he had put into the farm.

23,210. (*Mr. Channing.*) I think the question is rather whether you would give him any additional compensation for any loss that he suffers owing to removal?—Not if there was a bargain for breaking his lease; but, of course, I would if he was to be removed otherwise. A break means a termination of the lease.

23,211. (*Mr. Lambert.*) Supposing a man were farming from year to year, and farming well, and paying his rent regularly, and the landlord came in, and for some reason or other gave the man notice to quit, would you give him compensation for the loss occasioned by that removal?—I certainly think it ought to be taken into consideration, but I have never been in those circumstances, and have never been connected with a district where a yearly tenancy was the custom, so I could not answer exactly in regard to that. It is a question that never arises with us.

Mr. W. S. Ferguson. 7 June 1894.

23,212. Do you think that manure is often used unnecessarily in growing crops?—Not often now. The majority of farmers are well up to the general principles of manuring. There is very little manure wasted in that way.

23,213. I understood you to say that you used 4*l.* or 5*l.* an acre for roots; would not manure at the rate of 3*l.* an acre produce just as good a crop of roots?—Not for my purpose.

23,214. If you manured them at 3*l.* an acre, and had 2*l.* an acre used on the next crop, would that not be more advantageous than using so much at once?—I work on that principle, as much as possible; but in giving the land so much as that I want to produce a large crop for selling purposes. On my farms further in, where I do not sell, I do not give it so much. Where I do sell I rather risk the extra expense (knowing that, probably, it will not be required for the crop) for the sake of getting a full good-looking crop for selling. It is quite unnecessary to put on a ton of manure of any kind for one particular crop; but where you are marketing, and know that where you use phosphatic manures especially, you will get the benefit of all that is left another year, and you will get a large price for it, you can easily afford to give it more than enough.

Middleman's profits.

23,215. You complained just now that the middleman's profits on the farmer's produce were too large and too frequent?—Undoubtedly.

23,216. Have you thought out any means whereby that could be obviated, and the farmer and the consumer of the farmer's produce brought nearer together?—Not unless we revert back to the old system.

23,217. What was the old system?—The farmers just selling their animals and everything at home, and giving no commissions.

23,218. The consumer does not come to the farm, does he?—No. Of course, we have always one middleman. I do not think it is practicable for farmers to deal directly with consumers; I think it is absolutely necessary to have middlemen in order to carry on the trade.

Loans by auctioneers to farmers.

23,219. (*Mr. Channing.*) You spoke of some farmers being in debt to the auctioneers; can you give us any idea of the rates of interest charged for loans?—No, I cannot.

23,220. Do you know of cases in which very exorbitant rates of interest are charged?—I could not speak to the interest. It is not done by way of the auctioneer wishing to make a profit. The auctioneer does not wish to make a profit out of lending the man the cattle, it is simply done for security so that he will get payment. A farmer requires to buy cattle to put on his grass, and if he has no money to pay for them the auctioneer takes this bond over the cattle, but it is not for the purpose, mark you, of making a profit out of the farmer—it is merely to accommodate him.

23,221. Then you do not represent the farmers as paying exorbitant interest?—No, certainly not.

Leases.

23,222. I think you stated that the Scotch leases now generally have breaks in them?—Yes.

23,223. Is that found to meet the necessity of the times as regards readjustment of rent, or do you go farther?—It has been a benefit in that respect; because when a man has been, I will not call it too high rented, but when produce has been falling in price and land is falling necessarily, it gave him a chance at his break of making a rearrangement, and of getting the land at a lower price.

23,224. Do you think it is thought by men of your class to be a satisfactory arrangement, and to be one that is working satisfactorily?—In a measure.

Restrictions.

23,225. Mr. Hope has stated very strongly that restrictive covenants as to cropping are still very frequent in Scotland?—They are.

23,226. And are enforced rather rigidly in some cases; is that your opinion?—Yes, they are in force; but I have already stated that the enforcing of these restrictions, to my mind, as a practical man knowing the districts where they are enforced, that is, where they have come under my own observation—would not make very much difference; the farmers would not act differently, although they had their own free will.

23,227. You think the covenants are generally according to the practice of the most practical agricul-

Mr. W. S. Ferguson.
7 June 1894.

turists?—Yes, they are the sense of what is the right way, probably, to manage that particular district.

23,228. In practice, taking a dozen farms round yourself, are those farms, when the farmers are capable men and trusted by the landlord and the factor, practically worked as the man chooses or according to the covenants?—According to the covenants; but a covenant is not made with good farmers near a town; there is freedom of sale there.

Reduction in prices.

23,229. (*Captain Owen Thomas.*) What would you say is the average reduction in the prices of farm produce as compared, say, with 15 or 20 years ago?—Wheat is down one-half, and potatoes would be down from one-third to one-half.

23,230. What about the cattle?—That is a very indefinite thing, because at one time cattle may pay well, according to the price of beef, and at another time badly. I would always leave the feeding of cattle and the turnip crop out of the question in making up an estimate of profit and loss, because you never can tell, it depends on what the price of beef may be. For instance, this year I bought cattle in the autumn, and I bought them cheaply enough; but apparently beef has been so cheap that there is not much left to pay for the wintering. Last year it was different; we got a good return last year for cattle bought in the same way.

Reduction of rents.

23,231. What is the average reduction of rents in your district?—I was saying about 20 to 25 per cent. all round.

23,232. That does not represent the reduction in the prices of farm produce, does it?—No, nothing like it.

23,233. Would you say that farmers were making enormous profits previous to this reduction?—They were making good profits or they could not stand the bad times now. If I had not made some money in the good times I could not have stood the bad.

23,234. What per-centage were they making?—That is an indefinite thing; it depended entirely on the management. Some farmers lost their chances in the good times and did not make anything at all, while others made plenty.

23,235. Would you say that farmers are making their present rents on their holdings?—Not one that I know. The only farm that I have that is clearing and paying is a small one, where everything is sold at the Perth market and manure brought back.

23,236. Are there many farmers in arrears with their rent?—That is more a question for factors and landlords. I would not like to answer that. I believe there are a great many, I am afraid so.

23,237. Is the land as well farmed now as it used to be?—Part is as well, and even better, I think, and part has come down where the tenant has got hard up; especially on second-class land the fertility has gone down very much indeed.

23,238. That, of course, would mean a loss to the landlord later on as well as to the tenant?—It will tell on letting off the farm some day.

23,239. It would be better for the letting of the land to save the tenant now by making a reduction, than to allow the tenant to go on taking it out of the land?—Yes, but a great many of these kind of tenants are so hopelessly in the mire that I do not know what is to save them.

23,240. (*Mr. Everett.*) With regard to these bonds which the farmers give to the cattle dealers when the cattle dealers supply them with lean cattle, what is the nature of those documents?—They are printed documents which the farmers sign and the auctioneers hold, saying that until the cattle are paid for they belong to the auctioneer.

Malt tax.

23,241. You expressed an opinion that the repeal of the malt tax has had a prejudicial effect on the price of barley?—Yes.

23,242. You are aware, I have no doubt, that wheat has fallen a great deal more than barley?—Yes.

23,243. That was not owing to the repeal of the malt tax?—No, that was owing to a different cause; but they are both apparent.

23,244. You are aware that wool has fallen a great deal more than barley?—Yes.

23,245. What do you imagine has led to the great fall in wheat and in wool?—Both are due to foreign competition.

23,246. Is there not the same unrestricted foreign competition in barley as there is in wheat and wool?—No; if I understand it correctly they cannot grow barley abroad of the same quality that we can. Barley is one thing, especially of which they cannot grow the fine quality necessary for making the best beer, so I am told. At any rate, I know, for a fact, that they cannot grow the same quality abroad that we can.

Mr. W. S. Ferguson.
7 June 1894.

23,247. Still all the barley that is grown in the world is free to come to our ports just the same as the wheat and the wool?—Yes, but it will not suit the same purpose.

23,248. Does it not look a little unreasonable that while the barley has fallen much less than the other articles, you attribute such fall as has occurred in that to the repeal of the malt tax instead of to foreign competition?—We had in this case the evidence at once. In the other case the fall has been gradual; but we had the evidence of the repeal of the malt tax at once, for the barley came down in a very short time from 40*s.* to 30*s.* Thirteen years ago I remember very distinctly was the first time I had ever to take 30*s.* for Chevalier barley.

23,249. The malt tax was repealed, or rather transferred to the beer, in 1880?—Yes.

23,250. The average price of barley the next year according to the official figures was 31*s* 11*d.*, and it has now fallen, in the last recorded year, to 25*s.* 7*d.*, which is a fall of 6*s.* 4*d.* a quarter. Wheat in 1881 was 45*s.* 4*d.* a quarter, and that has fallen to 26*s.* 4*d.* So that while the barley has fallen 6*s.* 4*d.*, the wheat has fallen 19*s.* What do you say is the reason for that?—That they are due to different causes.

23,251. I cannot see where you get at that. It is true there was never any malt tax on the wheat. It really looks as though such changes as have been made in regard to barley have saved the barley from the same amount of fall as the wheat experienced?—I do not mean to say for one moment, in the face of these bad times, that barley would have kept up to the old price; although we have the direct evidence of the repeal of the malt tax bringing it down at once.

23,252. You will pardon me, but it did not come down for the next several years. It was 31*s.* 11*d.* in 1881, the first year after the repeal of the malt tax; the next year it was 31*s.* 2*d.*; the next year 31*s.* 10*d.*, practically the same price as in 1881; then 30*s.* 8*d.*; and then 30*s.* 1*d.* It was not for some years after that barley declined much, and then it did not decline anything like so much as wheat did?—No, but that will be due to the fact that they cannot grow good barley abroad. We may continue to get a fair price for very good barley always, because we have never seen any barley grown elsewhere which is as good. The alteration in the malt tax mainly affected the price of the best barley, so that the fall in that class of barley is not correctly stated in average returns.

23,253. All I wanted to call your attention to was, whether you are not attributing such fall as has occurred in barley to the wrong cause, inasmuch as other grains which have not had any such cause affecting them have fallen a great deal more than barley. But it is a matter of opinion, perhaps. Can you tell us how much the rates come to per acre on your farms, or on one of them, on a rough average?—Yes, I can tell you in the aggregate. In the aggregate it is between 90*l.* and 100*l.* on 1,030 acres.

Rates.

23,254. Then your rates are very trifling indeed. What would that amount to on the acre; it would be about 1*s.* 6*d.* an acre, or something like that, would it not?—Yes, something like that.

23,255. And the landlord pays an equal amount in rates?—Yes.

Farm repairs

23,256. Who does the repairs of your farms, the tenant or the landlord?—I make my landlord do all repairs of every description, drainage, fencing, and building. I would not hold any landlords' land under any other conditions. The only money I have ever spent on another man's property has been spent in improving my dwelling-house. I spent something on that for my own personal comfort. But I think a man is not doing right who spends under present circumstances his own money on any other body's property.

23,257. Do you pay anything for repairs?—After we get everything done we are supposed to keep it for a certain time in good order. Speaking about repairs, I get everything in first rate condition, and I have to

Mr. W. S. Ferguson.

7 June 1894.

keep it in that condition, bar ordinary tear and wear of course—natural depreciation.

23,258. If you have a wooden building, for instance, does the landlord find you the rough stuff, the wood, and do you find the labour?—We have no wooden buildings; they are all stone and lime.

Income tax.

23,259. You Scotch farmers are assessed to the income tax in this way, are you not; you pay on one-third of your rent?—Yes.

23,260. I was trying to compare the rent of a Scotch farm with that of an English farm. The English farmer pays income tax on half his rent, and the English farmer's rent would exceed yours by the difference in the rates—the English farmer paying the whole of the rates, and you paying only half?—Yes. The way I look at it is this: there is not very much fairness in asking a man to pay income tax if he has no income.

23,261. You have the opportunity of showing your books, have you not, and so can get off paying?—I say I did that. I took the opportunity of doing that. I went to the trouble of getting up all the profits and losses for three years and showing it, and I got it back from the assessors; but it was not worth the candle, and I did not try it again. I might do it well enough just now.

23,262. Do you think, taking the last 20 years, for instance, that charging the Scotch farmer on a third of his rent has been about a fair mode of coming at the income which the farmer had made before the times became so exceptional?—If you put it all in the aggregate it might possibly be so.

23,263. You do not happen to know why the Scotch farmer has only been assessed for income tax on a third of his income, while the English farmer has been assessed on half?—I was not aware of that fact until you told me.

Labour.

23,264. About how much would your labour cost you per acre, do you suppose?—I was counting it roughly that my labour costs me about the same as my rent, that is, from 1,500*l.* to 1,600*l.* I am sorry to say that I did not bring the figures with me: I meant to do so, but I came away hurriedly.

23,265. It costs you about 30*s.* an acre then?—Yes, all round.

23,266. I suppose the best farms that you pay most rent on you probably put most labour on too?—Yes.

Importation of Canadian cattle.

23,267. You referred to Canadian cattle, and I understood you to express the opinion that the agitation for the importation of Canadian cattle does not arise from *bonâ fide* farmers in Scotland, but from those interested in bring the cattle over?—More particularly from that source.

23,268. Still, do you not think that when they were coming over, a farmer could buy in a great deal more for his money of Canadian cattle than he could of home-bred cattle?—I have never found it so, and I have fed Canadians.

23,269. Have you not?—I feed all kinds of cattle. I have always found my home-bred ones far more satisfactory, and that they left me more money than any I have bought.

23,270. (*Mr. Channing.*) Your opinion is based on your experience of feeding both, as I understand?—Yes, on my own experience. If Canadians were coming in to-morrow I would be buying them for certain. I want all kinds of cattle. I cannot breed a third of what I need.

Mr. W. S. Ferguson.

7 June 1894.

23,271. You want them because of the quantity, not because of the cheapness?—That is so. If I could breed all the animals I require I would do it.

23,372. (*Mr. Everett.*) Our experience in Suffolk was that we could buy a great deal more for our money of the Canadian cattle than of all such others as were available to us, and that they paid us better?—But a selling day comes with them unfortunately, when you have to sell them at 30*s.* a cwt. I have no statistics to offer, but there is the natural feeling that a beast of that size eats far more than a little one.

23,273. We compare them with Irish cattle. Our source of supply is from Ireland, and we can get good short-horned cattle from Ireland; but we found with the Canadian cattle that we got more for our money, and that they left the farmer more for his profit on the feeding than the others. But that, I understand, has not been your experience in comparing them with your home-bred cattle?—I would put Canadians and Dublin Irishmen on the same platform; they are both equally bad.

Sale by live weight.

23,274. Where you sell by the live weight —— ?—I do not sell by live weight. I weigh them for my own satisfaction, and I wish it was the custom that we did sell by so much per. cwt. I know by my actual figures what I am getting per cwt. when I do sell, because all my cattle are weighed. I have endeavoured very much to sell by live cwt., but I cannot get the butchers to agree to it.

23,275. About what deduction have you to make from the live weight to get at the dead weight of fat cattle?—It depends on the quality of the animal a great deal.

23,276. (*Viscount Cobham.*) It is a very common thing in Scotland, is it not, to sell by live weight?—No, sale by live weight is not common. We know the live weight, but we do not sell by the live weight; we do not say at the sale, "I want so much per cwt."

23,277. (*Mr. Everett.*) What is the difference between the live weight and the dead weight?—From a little under a third to nearly a half, according to size and quality.

Decreased acreage under barley.

23,278. (*Mr. Channing.*) I want to draw your attention to some figures given by Mr. Hope, according to which the diminution of the acreage of barley in Perthshire is very much greater than the corresponding diminution in the acreage of wheat and of oats. As you have given so much evidence about barley, I should like to ask you why that is?—I see the figures are for 1892. I think, probably, it would be the case that if you look up barley it was cheaper in 1891, and so they sowed more oats. The statistics next year will show a larger acreage of barley and a smaller acreage of wheat.

23,279. You have no other explanation to offer as to the diminution of the area?—No.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock

Forty-third Day.

Friday, 8th June 1894.

PRESENT :

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., } *Assistant*
Freeman Thomas, Esq., } *Secretaries.*

General Sir A. Cotton, K.C.S.I.
8 June 1894.

General Sir Arthur Cotton, K.C.S.I., called and examined.

23,280. (*Chairman.*) You are an officer, lately in the Royal Engineers?—Yes.

23,281. And you were employed for some time in India on the irrigation works in Madras?—Yes, for many years.

23,282. And as a result of that, very large additional revenue was obtained from the works and from the land under your supervision?—Yes.

Increased capacity of production.

23,283. The point which you wish especially to give evidence upon is the capacity of the land to produce far beyond what it is supposed to be capable of producing according to the general opinion on the subject, I believe?—Yes, that is the point.

23,284. Have you yourself conducted experiments with a view to obtaining much greater produce from the soil?—Yes.

23,285. Will you state shortly what experiments you have conducted?—I have only cultivated small plots in the different gardens that I have been in.

23,286. Not on a large scale?—No.

23,287. Will you, please, make a short statement of what you have done?—I have stated in my pamphlet on the subject all that I have got to say as to what I have done.

Process of cultivation and result of experiments.

23,288. The principle which you wish to advocate is the very deep cultivation of the land?—Not merely deep cultivation. The first point is the thorough aeration of it by the complete pulverisation—whether it is 6 inches deep or 3 feet deep, that is the main point I insist upon—the reducing the soil to absolute powder and exposing it several times to the air so as to get it thoroughly aerated.

23,289. Down to what depth?—Any depth—I have cultivated to 3 feet, but I do not insist upon any particular depth.

23,290. Is that with spade cultivation?—Yes.

23,291. Is it coupled with very heavy manuring?—I began with very heavy manuring. I found it was not only unnecessary but absolutely injurious, and now I give about 30 tons to the acre.

23,292. Is that five or six times as much as the ordinary amount of manure?—Yes; reckoning the ordinary amount at 20 tons once in four years it would be five tons, and I am now giving about 30. I do not insist upon the quantity of manure because I have not tried it out fairly.

23,293. And the result of your experiments has been that the produce of the soil has been enormously increased?—Enormously increased even in ordinary years, but last year there was an immense crop where there was none at all on the farms.

23,294. What is the area of ground on which you have tried these experiments?—About a rod and less.

23,295. Has any experiment been made of the same kind upon larger areas of land?—Not that I know of.

23,296. You state the result of your experiments in the pamphlet which is before the Commission?—Yes.

23,297. Do you think that the system is applicable to larger areas of land or not?—I am quite certain it is. There is no possible question about it. What one rod will produce an acre will produce in the same proportion.

23,298. Would that be by spade cultivation or by ploughing?—By plough.

Wheat.

23,299. (*Viscount Cobham.*) At the rate of how many bushels of wheat have you grown per acre?—Up to 130.

23,300. On what character of soil?—Poor soil—25 bushel soil; that is five bushels below the average of wheat.

23,301. What was the character of the subsoil that you turned up?—Silicious sand.

23,302. Have you got a sample of the wheat here?—This is a sample of this year's growth (*producing sample*).

23,303. Cut green?—Yes, cut this morning.

23,304. When was it sown?—The beginning of September.

23,305. How long has the piece of land been treated in your way that has grown this wheat?—It is about seven or eight years that I have cultivated it in this way, but not the same crop on the same land—the rotation is wheat, grass, potatoes, cabbage.

23,306. Has that had 30 tons of manure for this crop?—Yes, for this crop.

23,307. What manure?—Stable manure. After I found the injurious effect of too much manure I stopped it entirely for two years.

23,308. Has the manure been applied to the surface, or has it been thoroughly mixed with the subsoil?—Entirely mixed. That is a question I am not sure of, whether it had not better be all put in at the upper foot, but I have mixed it all through.

23,309. How did you mix it all through?—By digging.

23,310. What has been your experience with potatoes?—Some years ago I planted potatoes in light rich sandy soil at Tunbridge Wells, and the first year it produced at the rate of 30 tons to the acre.

23,311. What has been your experience on the poor Surrey soil?—It has produced from 15 to 25 tons per acre. This land is by no means reduced to the perfect state of pulverisation that it ought to be, so that it is not equal to the Tunbridge Wells land in respect to cultivation.

Rye grass.

23,312. What has been your experience with rye grass?—I have tried two kinds of grasses—English grasses and Italian rye grass. The Italian rye grass has not equalled the English grass. Last year on the 1st of June I cut upwards of 2 lbs. of hay per square yard of English grass, which is equal to 4½ tons of hay per acre, and I had two cuttings afterwards making it up to seven tons, when the produce of the fields around

General Sir A. Cotton, K.C.S.I.
8 June 1894.

General Sir A. Cotton, K.C.S.I.

8 June 1894.

me was nothing at all in the first crop and perhaps half a ton in the autumn.

23,313. Have you had any difficulty with those great weights of produce as regards the falling of the crops?—Yes, they have been liable to fall. I have put in pea sticks here and there which has prevented it.

Cost of process.

23,314. Have you ever estimated the cost of the process on a farm where machinery could be employed?—I have no doubt about it whatever myself—I cannot make an accurate calculation because I have not the materials, but I pay 24*l.* an acre for digging. I have no doubt it could be done for 5*l.* or 10*l.* by steam or horse power. I have no doubt about that. On Lord Tweedale's farm I saw him ploughing 16 inches deep with four horses in one furrow.

23,315. It would not be necessary on a large farm to break it up by hand at all?—No, not at all, it could be done entirely by animal power or steam power.

23,316. I see you put the first cost at 100*l.* per acre?—That was merely my way of doing it.

23,317. I see also that you recommend a 12 share plough; how many horses would that require on stiff land?—I do not know how many. For the first breaking up it might take six or eight horses.

23,318. The return in the account on page 16 of your pamphlet is put in, wheat at 150 bushels per acre, and 10 tons of straw; I suppose that is to be taken on good wheat land?—On good rich land, land now yielding say 40 bushels.

23,319. The cost per acre therefore, charging interest upon the preliminary expenditure, would be 29*l.* and the returns 54*l.* showing a profit of 25*l.*?—Yes.

23,320. That is taking the wheat at 4*s.* 6*d.* a bushel which is a good deal more than you can get now?—Now, but it was the price then. In the first place it was not this year, it was last year; in the next place I allowed a little for quality, the quality is so superior. When I showed a sample to a miller he said, "I never saw such "a sample in my life."

23,321. What subsoils do you consider fit or unfit for this process?—Almost all subsoils are fit for it, except the actual rock.

23,322. What would the character and cost of the cultivation be after the preliminary breaking up?—I should suppose if it was done with horse power that you would have perhaps the upper plough 15 inches or 18 inches, and the subsoil plough of 15 or 18 inches also turning over the subsoil in the trench, and after two or three years bringing the whole up, turning it up entirely, bringing it up to the top by any implements that could be made.

23,323. Would the cultivation be more expensive than the ordinary system of cultivation?—Yes, certainly.

Process of cultivation.

23,324. Would it be necessary to turn the soil up every year by deep ploughing?—I do not know. All those details must be worked out. I cannot give any information about them.

23,325. Is it your belief that continuous corn crops might be grown under this system?—I think there ought to be a variation of crops, as there is now.

23,326. You have not tried continuous corn growing?—No.

23,327. If your theory is correct it is a very wasteful thing to keep land under permanent pasture?—It is a perfectly monstrous waste.

23,328. You refer to Lord Tweedale's experiments of many years ago; why have they been discontinued?—I know nothing about Lord Tweedale's farm since 1854.

23,329. But the inference is that no great profit could have been made or else the deep cultivation would have been continued?—I do not know anything about that.

23,330. Have any bad results occurred from uniting the subsoil with the surface soil?—I think in general it is quite destructive to bring the subsoil up to the top at first before it is aerated. With most soils I think it would be advisable only to mix a few inches at a time. Lord Tweedale told me that he brought up two fresh inches every year and mixed it, and it was four or five years before he mixed the whole 16 inches. But a gentleman told me that he had tried it on his farm and the first year he mixed it all up and it was a complete success.

23,331. Your belief is that an enormous capital may profitably be employed in this new system of agriculture?—Any amount. A thousand millions could be invested next year on the land in England with enormous profits. I am persuaded of that.

General Sir A. Cotton, K.C.S.I.

8 June 1894

Increased employment of capital and labour

23,332. And a corresponding amount of additional labour employed?—Yes, there would be an immense increase of labour.

23,333. The system would be applicable to all parts of the world?—Yes.

23,334. Therefore, should we not be exposed to the same competition that we are exposed to at present?—With this immense advantage that we have the labour and they have not.

23,335. If the process pays, will not machinery be more and more employed?—More and more. The immense advantage of steam machinery is that you can bring an enormous amount of power to bear for two or three months in the autumn and two or three months in the spring, without its costing you anything during the rest of the year. That is the immense advantage of steam power.

23,336. Then perhaps we shall not require so much more labour as you seem to think?—There must still be much more hand labour.

Wheat. Liability to mildew.

23,337. (*Mr. Whitehead.*) Is wheat grown upon this system more liable to mildew than wheat grown upon the other system?—No; less. I am persuaded that wheat or anything else grown in this way, will be so much stronger as to be more able to resist all the evils of bad seasons and everything than it does at present.

23,338. I ask that question because there seems to be a good deal of mildew upon this example produced?—A few leaves are in that state, very few. The great mass of it is perfectly green.

Liability to fall.

23,339. Then with regard to the falling of the wheat, is it more liable to fall than ordinary crops?—I am not sure, but I think it would be.

23,340. I think you proposed to prop it up with rows of pea sticks?—I myself think that the value of the produce would be so great that they could adopt means for supporting it which are not thought of now with the present small produce.

Process of cultivation.

23,341. Upon a field of 50 acres would that be possible?—Perfectly possible; there is nothing to prevent it. That is a photograph of the present crop taken a day or two ago (*producing photograph*).

23,342. (*Mr. Channing.*) I should like to ask whether your process could be carried out with a deep clay subsoil as well as with other subsoils?—Perfectly well.

23,343. (*Captain Owen Thomas.*) If the soil is turned the first year and mixed with a clay subsoil at three feet depth what prospect of a return would there be that year?—I think there would be a double or treble return the first year, although the subsoil was not brought up, if it was well granulated—if it was pulverised tolerably well.

23,344. That would mean turning it over three or four times before you sow the seed?—Yes, I should say that would be advisable.

23,345. (*Mr. Everett.*) What is the largest area to which you have seen this process applied?—Nothing but these little plots. A gentleman has written to me from Salisbury that he is ploughing 10 inches deep and subsoiling 10 inches more and going over it four times, so he is giving it a good trial this year. That is Mr. Harding who is managing a home farm at Salisbury for a member of the House of Lords—I forget his title.

23,346. (*Viscount Cobham.*) Do you find these heavy crops kill out the weeds?—I never allow a weed on the land.

23,347. You get it thoroughly clean first?—In India I have ridden 100 miles without seeing a weed. I never allow a weed on the land. Here is a plant of wheat weighing 4¼ lbs.; taking off the root it is about four pounds of green plant; there are 30,000 plants to the acre as it is planted; that would be 120,000 lbs. of green plant if it was the average; but say the average is about one-sixth less, that would be about 100,000 lbs. to the acre, and allowing four pounds of green to one of straw it would be 11 tons of straw at this moment on that land. That would be equal to 50*l.* an acre at this moment, leaving out the corn altogether.

The witness withdrew.

Mr. W. H. Clarke.

. Mr. WILLIAM HENRY CLARKE called and examined.

Mr. W. H. Clarke.

8 June 1894.

23,348. (*Viscount Cobham.*) I think you are a land agent living near Chatteris, Cambridgeshire?—Yes, I live at Chatteris, and I do business at Chatteris and Wisbeach.

23,349. Are you a valuer as well?—I am not an agricultural valuer.

23,350. Are you exclusively a land agent?—Exclusively.

23,351. Do you farm yourself?—No; I have farmed but only when I have been interested in mortgaged property; I have never farmed voluntarily.

23,352. How much land have you got under your care?—I cannot give you those figures—my business is largely personal and to a great extent in the immediate neighbourhood of Cambridgeshire. You may take it that it is not very large in comparison with those you have had before you previously.

Condition of agriculture.

23,353. What is the condition of agriculture in your district generally?—I think I can call it very bad everywnere. It is not so bad in the fen country as it is in the high land surrounding it.

23,354. Is that owing to the seasons having suited them better?—I think so.

Small holders.

23,355. I believe you wish to speak more particularly about the small holdings in the neighbourhood of Chatteris?—Yes.

23,356. Are there many?—There are a great many small holdings in the immediate neighbourhood of Chatteris.

23,357. How do you define the small holdings?—I should call the largest about 50 acres and the smallest about four.

23,358. Are they rented or owned by the occupiers for the most part?—A few of them are owned by the occupiers but the most part are rented.

System of cultivation.

23,359. What is the system of cultivation of these small holdings?—They are very largely cultivated for roots, carrots, mangel wurtzels, and potatoes. Near Chatteris I suppose we have from 100 to 150 tons a night of these roots going up from these small holdings to Spitalfields market at certain seasons of the year.

23,360. Are the whole of the crops sold off?—Yes.

23,361. Is the land very suitable for root cultivation?—The land is very suitable for root cultivation.

23,362. What are the rents for it?—I can give you an instance on 600 or 700 acres in one portion of the fens.

23,363. Are these small holdings all on the fens?—The whole of the small holdings are on the fens.

23,364. And it is an area of 600 or 700 acres you are going to speak of?—I am going to give you an instance of 600 or 700 acres which are conveniently divided.

23,365. (*Sir Nigel Kingscote.*) Are they entirely arable?—Almost entirely arable. These were originally enclosures appurtenant to commonable houses, they are all about the same size, namely, 3 acres and 3 roods. The 700 acres is divided into lots of that size. These lots are all subject to taxes amounting to 17*s.* 6*d.* an acre payable by the tenant.

Rates and taxes.

23,366. Both rates and taxes?—Tithe, rates, and taxes. We do not come within the four corners of the Tithe Act, and the tenant pays the tithe in our case.

23,367. 17*s.* 6*d.*, I think you say they amount to?—Yes, and sometimes a trifle more. The rent of these lots nearer the town, not a great number of them, but a few of them, comes to 14*l.* a lot; that is 14*l.* for the three acres and three roods.

Rents.

23,368. (*Viscount Cobham.*) Have the rents been reduced?—They have hardly been reduced at all; a few have been reduced and have come down to 7*l.* a lot. Many of these are down a bad road. The road is bad entirely through the fen, and those which are further from the best roads have been reduced to 7*l.* a lot.

23,369. Do you consider that the tenants are able to pay these high rents?—They have been up to the present time. I think these rents have been paid for 20 or 25 years, and paid cheerfully and well. There is great competition for these lots even to-day, but I am afraid the tenants have been losing their capital during the last two years.

23,370. Owing to the seasons or the prices?—Owing to the prices. The price of potatoes last year was a very heavy blow. Their potatoes are all dark and they were almost unsaleable last year.

8 June 1894.

Condition of agriculture.

23,371. Can you not grow early potatoes?—Not so well.

23,372. Still they are having a good turn now in the price of potatoes?—No, fen potatoes will hardly be saleable so late in the season as this; they will get almost black.

23,373. How are the crops doing now?—The crops look wonderfully well this year.

Reductio of rent.

23,374. Have many applications for a reduction of rent been made and refused to your knowledge?—No, for the simple reason I think, that there is still such great competition for the lots, that they will not entertain applications for reductions.

23,375. What buildings are there on these plots?—No buildings whatever.

23,376. No stock kept?—In a few cases they keep stock, but in many cases they do not keep stock.

23,377. What rotation of crops do they adopt?—They have a corn crop and a root crop; sometimes two root crops, and then another corn crop.

23,378. Do you consider that if prices remain at their present level, it will be impossible to pay the same rents and make a profit?—I believe so. I may give a little personal experience if you will allow me, which induces me to think so. I have let several of these lands and have some very good tenants and they have paid up for many years, but they do not ask for a reduction, though I am certain they are suffering very much now and are losing money; they tell me as much as that. The owners of many of these little plots are as poor as the occupiers.

23,379. Then there are small owners as well as small occupiers?—There are; and there are cases where they come under settlements in the hands of mortgagees; it seems almost impossible to regulate the rents at all.

Labour.

23,380. Do these small occupiers employ outside labour to any extent?—No, they assist one another often in ploughing, and so on.

23,381. Do they use ploughs for the most part?—Yes, they plough their land and keep horses; they keep one horse at any rate and, if necessary, borrow another horse.

23,382. They interchange services with each other?—Yes.

23,383. What do you think is the immediate future before these small occupiers if present prices go on?—I am sure they cannot continue at present prices.

Reduction of rent.

23,384. The owners must reduce their rents?—I am sure they must reduce their rents. I think it would be practicable to do something in these cases. This best fen land which is adapted for this kind of cultivation is very frequently only approachable by a bad road. I think in the parish of Chatteris, for 40 years, there has been no improvement of these occupation roads. Many years ago, I am told, there was a movement in that direction, but to-day there is none. I believe if powers were given to county councils, or if we could have some effective way of approaching the question of road making, so as to put more land in the hands of men of this description, rents would of themselves be automatically reduced, and so there would be relief where it was required.

Roads and drainage.

23,385. Are the roads now maintained by the occupiers?—These fen districts are divided into smaller districts, and generally they have an officer, and some of them combine together and an officer keeps the roads up.

23,386. Together with the drains?—They combine together for the purpose of keeping up the roads. Certain officers will also take in hand the question of those droveways and the drains are kept up by an officer of the Internal Drainage District.

23,387. Is there a combined rate for the drainage and the roads?—There is a rate to each one and they contribute to the road making.

23,388. Do you think that a part of that burden ought to be thrown upon the broader shoulders of the

Mr. W. H. Clarke.

8 June 1894.

county?—No, I do not think that; I think that there should be a totally different state of affairs. There are farms some distance down these roads, and the tenants all pay highway rates, but they have no power whatever to make a road to their farms. I suppose they could make a road and go to the justices, but then they would not know whether the road would be adopted by the county until they had made it and the decision would not be given till then. I maintain that these men are entitled to a road to their occupations.

23,389. (*Sir Nigel Kingscote.*) Are the roads hard roads?—I have examined two or three of these men, the occupiers of these lands, and they said that in the middle of last winter it was totally impossible for them to get up with a load of their produce. They are all fen roads, and two horses can hardly pull up an empty cart sometimes.

23,390. (*Viscount Cobham.*) Are there special difficulties in making and maintaining a fen road?—I think not. It is expensive, but I believe the difficulty could be met if a scheme of this sort were devised, if an application could be made to the county council and the county council seeing full cause or sufficient cause for it, had power to order, and to levy a tax, half upon the owners and the other half upon the parish.

23,391. But hitherto the county council have not taken over any occupation roads?—No.

23,392. Only main roads?—That is so. It is almost impossible to put any machinery to work as far as I can see, to get these roads made under the present legislative powers.

23,393. Do you think it would be illegal at present for the county council to take your occupation roads?—I am sure they would not take them over.

23,394. Would you give them additional powers for that purpose?—I would give them additional powers, enabling them to rate a distinct parish for these roads.

23,395. (*Mr. Little.*) Is there not a power under the Middle-level Drainage Act, for a district to make the roads and to charge the lands?—There is.

23,396. But I suppose you think that that would be throwing the cost upon a limited district, and that it should be thrown upon the whole parish?—No, my object in not referring to that power was this:—All the combined districts have to agree if they adopt that Middle-level Act, have they not?

23,397. I thought there was power to limit the area by application to the justices?—I believe not. I believe that all the combined districts in any way affected by it, have to agree, and one dissenting district can entirely stop it. It has been tried, and it has not been found effective, because those who are not quite so much benefitted dissent.

23,398. (*Viscount Cobham.*) Do you say that under the present system both owners and occupiers are too poor to keep up proper roads?—I did not wish to convey that.

23,399. Then why do they not do it?—It is almost impossible in practice to do it. Here is a road entirely composed of fen. It will cost something like 500*l.* a mile to make it a suitable road for its purpose. There are many who should contribute who would evade payment entirely, and it would be only those who take a strong line about it who would have to bear the burden and heat of the whole thing.

23,400. Have you anything further to add with regard to the roads?—I have just made a little note about them, I do not know whether I have conveyed the point to you; I think power is required that upon sufficient cause being shown the county council should order a parish to make such a road into a public highway; the cost might be charged say half on the lands benefited payable by the owners; this money might be borrowed and paid off by a sinking fund; the remainder would be chargeable to the parish. It must be borne in mind that the owners and occupiers of these lands all pay highway rates. This would do away with the jurisdiction of the justices. At present if a road is made the parish may take it or not at the discretion of the justices and their decision is not known until after the road is made.

23,401. Is the road question a very serious matter with these small cultivators?—Yes, it is to those in the farther extremity of the fen; and it is all over the fens; I would not refer to this particular fen only.

23,402. It affects the cost of their getting their produce to market?—It not only increases the cost of getting their produce to market, but it prevents them getting it to market at all at certain seasons of the year.

Mr. W. H. Clarke.

8 June 1894.

23,403. The roads in fact will not carry the weight?—The roads will not carry the weight at all. The principal advocates in this particular instance of some system of getting a road are large occupying owners, who are quite willing to bear their share of the cost.

Copyholds.

23,404. Are many of these properties copyholds?—Yes, a great many of them.

Enfranchisement.

23,405. I see you wish to say something with regard to the present law of the enfranchisement of copyholds; in the first instance do you find that copyholds are a disadvantageous form of land tenure?—I think they are a very disadvantageous form.

23,406. In what way?—We have many, I was going to say, little freeholders, we have many little copyholders, men who have purchased small properties of the description I have just been speaking of, and they have suffered very much in the amount it has cost them and their families at the time of death for taking up. Often they have had to pay on improvements, particularly where they have made any buildings.

23,407–8. Are the fines arbitrary?—Yes, and now it has come to this, that I think people are unduly frightened of copyholds, and you can hardly deal in them in a great many cases. In many cases when people wish to enfranchise I think they get to recognise the disadvantages, and they are all afraid to face the enfranchisement and the many uncertainties that occur respecting it. I should like to instance one case of an enfranchisment, which I think shows the evils thoroughly. I acted as valuer for the tenant. My friend initiated the enfranchisement, and the lord claimed between 90*l.* and 100*l.* I offered him 20*l.* without prejudice in the matter. He refused to have anything to do with it, and we went to an umpire. The two valuers' and the umpire's costs were nearly 25*l.*

23,409–10. Was that under the Board of Agriculture?—This was under the Board of Agriculture. The other costs came to the sum of 15*l.* or 16*l.*, or a little more, and the amount of the award was 9*l.* 5*s.* 5*d.*

23,411. (*Mr. Channing.*) What were the total costs?—I have not got them exactly with me, but the total costs I am prepared to say were over 40*l.*, and a large proportion of those costs were heaped up by the attitude the lord's advisers took in refusing to entertain any fair offer. I offered them 20*l.*; I said, "It is double "any amount you can possibly have," but they knew they were driving us to expense, and they fought it out.

23,412. (*Mr. Whitehead.*) Were the costs divided in that case?—No, the whole of the costs are paid by the party initiating the enfranchisement.

23,413. (*Mr. Little.*) There was no power to divide the costs, was there?—No power whatever.

23,414. (*Viscount Cobham.*) In what year was that?—I should think that would be about three years ago. I have had several cases since, and it always comes in that way, that owing to the costs not being left to the jurisdiction of the umpires, if you initiate the enfranchisement you are always saddled with the costs of an umpire, and it is usual now for the tenant to initiate the enfranchisement, and not for the lord.

23,415. But the lord has to pay for his own valuer, has he not?—No.

23,416. You do not complain of the scale of charges fixed by the Board, do you; they are low?—I complain of one thing; I think that whatever scale of charges may be fixed by the Board, they ought to be adhered to.

23,417. Is that not the case?—That is not so. Valuers simply say, "This scale is for guidance only," and in many cases they do not adhere to it.

23,418. Surely if that was brought before the Board they would tax the costs in accordance with their own table?—I do not say that the charges are very grossly high, but I say that it imports another element of uncertainty into the question.

23,419. The authorised charges are extremely low, are they not?—They are. There is another point I should like to say a word upon and that is the table of compensation. That also is only for guidance and it is

Mr. W. H. Clarke.

8 June 1894.

sometimes difficult to get it taken. There is another evil connected with it. The table is for a two years' fine on alienation either by death or sale. In most of the manors in our district it is a two years' fine for alienation by death, and a year and a half for sale, making the fine interval rather different. But it is very difficult to get that recognised.

23,420. You mean the difference between the one and a half and the two years?—Yes; I maintain that one-eighth ought to be taken off the scale in those circumstances, yet it is extremely difficult to get it recognised, particularly by a lord's valuer.

23,421. But if the enfranchisement is carried through in the office, surely they would exercise some control over those payments?—I am afraid they do not. I had a case which I think will illustrate that. I was enfranchising some property in these circumstances, and I said to the valuer upon the other side, "Will you take off this eighth?" we had agreed as to all the rest. He said, "Certainly not; I have nothing to do with it." I said, "I will agree to your figures if you will allow me to "present the thing to the Board of Agriculture." He said "No, you must let our figures go in as they are." They went, and they were not noticed.

23,422. These charges are lower than the charges in former scales, are they not?—I should think that probably is so, but I am not aware of that.

23,423. I see there is a note calling attention to the fact that the table has been constructed upon the basis of a fine, arbitrary upon two years' annual value?—Yes, I am aware of that.

23,424. So where it is a year and a half the proper deduction ought to be made?—If you go to an umpire to-day you do not know that he will take that view of the case at all. There are no instructions. I know a valuer who is largely employed as an umpire, who does not take that view of the case and will not allow the eighth off.

23,425. You admit, I suppose, that the costs in small enfranchisements are bound to bear a large proportion towards the sum receivable?—Yes, I think that is inevitable.

23,426. Have you any other criticism to make upon the scale?—I have no other criticism to make upon it.

23,427. That concludes the points you have mentioned in your brief—would you like to supplement them?—I would like to say a few words more upon copyholds, and to make a suggestion or two if you consider I might do so.

23,428-9. Do so, please?—On any vacancy in the rolls at the present time the lord must serve notice to the tenant of his willingness to enfranchise, and the tenant can enfranchise or not. If the tenant initiates enfranchisement after that he has to pay the costs. I think that in these cases whichever party initiates the enfranchisement on an appeal to the umpire the costs should be in the jurisdiction of the umpire. Then I think the tenant on the rolls should be able to agree for a sum for enfranchisement, that is to say, should be able to enfranchise, the sum to be payable on his death or on the sale of the property—to be a deferred payment and not an immediate payment. These men clear their property for their lives really when they take it up, and enfranchisement afterwards is a very inequitable thing I think, unless it is done by a deferred payment.

23,430. Has it to be paid in the lump in every case at present?—No, it has not; it is paid sometimes by rent-charges, but they are very undesirable. In practice those rentcharges are about as undesirable as you can possibly have anything. For instance, a landowner enfranchises his property subject to a rentcharge and at his death it is sold. Each of these purchasers has to give and take cross covenants with reference to that rentcharge if he is to be at all secure for the future.

23,431. How would you make the money payable?—I would make it payable in a lump sum. I would make it possible for a man to enfranchise for the payment to be made on his death. I say that to make a man take up his copyhold and to enfranchise too is practically clearing it for his life twice over, and it is very inequitable.

23,432. You discourage the creation of rentcharges?—Yes.

Small holders.

23,433. (*Sir Nigel Kingscote.*) As regards these plots of land, upon what size do you consider a man can live and bring up his family upon, how many acres would you say he would require to do that?—It is a little hard to say. I can give you instances of men who live on I should think about 12 or 14 acres.

Mr. W. H. Clarke.

8 June 1894.

23,434. Freehold?—I am speaking of tenants now. These men so often have small accessories. For instance, they do a little hackney team work, higgling work as they call it; then they grow perhaps a few acres of carrots with a farmer.

23,435. That would not be gaining the whole of their living from the 14 acres?—No; I say it is rather difficult to say how many acres would do. There are a very few of them who do not do something extra.

Cultivation of small holdings.

23,436. It is all pretty good land?—It is all good land.

23,437. How do they get manure on to this land if there is no capital?—They often do not manure it for 15 or 20 years together; some of the land is never manured, some is.

23,438. But it still keeps up its fertility?—I think it does; it still keeps on cropping.

23,439. (*Mr. Little.*) Do some of them use artificial manures?—Yes, several of them use artificial manures with the spring cropping.

23,440. (*Sir Nigel Kingscote.*) I suppose now and then they compete with the early markets and get an extra price for the potatoes and other roots?—No, it is not early enough land.

Roads and drainage.

23,441. Do they have to pay drainage rates as well as road rates?—Yes.

24,442. Are they heavy drainage rates?—The drainage rates on these lands that they pay are 6*s.* 8*d.* to the middle level drainage, and then their internal drainage which comes often to 2*s.* and 3*s.*

23,443. The roads as a matter of fact are generally run upon the top of the banks, are they not?—This is practically a fen that has been cut by dykes into plots of land like allotment plots.

23,444. It is a peculiar plot of land then?—I should not say that it is peculiar for the fens.

23,445. May I ask why more progress has not been made in making roads in this particular parish or district that you are speaking of, as has been done in other cases?—It is very difficult to get them all to agree to do it. Then I think if you take the fen country pure and simple you will find everywhere of late years there has been very little done in the way of road making.

Small holdings.

23,446. (*Mr. Whitehead.*) How large are those small holdings, taking an average?—They vary, as I said before, from about four acres to fifty.

Rents.

23,447. What would be the average rent?—The average rent of the smaller holdings would be about two guineas an acre, plus 17*s.* 6*d.* taxes, which would be 3*l.* an acre for the smaller holdings.

23,448. Up to what acreage would that be?—That would be up to 20 acres.

23,449. And beyond that?—Beyond that I should say about 35*s.* and 17*s.*—about 52*s.* in all.

23,450. Up to 20 acres rent would be two guineas plus the 17*s.* 6*d.*

Rates and taxes.

23,451. Would the tenant pay the rates and other things?—I am putting all the rates and drainage taxes in bulk in the 17*s.* 6*d.*

23,452. Poor rates and all?—Yes.

23,453. What would the cultivation be on the smaller plots; would they be hand dug or ploughed?—All ploughed.

Cultivation of small holdings.

23,454. And manure, you say, is not put on for many years frequently?—Some few of them keep a few pigs and put a little manure on, but many of them are not manured at all.

23,455. Is it ploughed to any extra depth or only the ordinary depth?—Only the ordinary depth.

23,456. Still the fertility is maintained?—Yes.

23,457. What root crops were you speaking of?—Carrots, mangel wurtzels, and potatoes. I have known one of these small occupiers in harvest time, dig his carrots and wash them and send them up to Spitalfields and make between 30*l.* and 40*l.* an acre of them.

23,458. White carrots probably?—No, red carrots.

Mr. W. H. Clarke.
8 June 1894.

23,459. Could they send mangel-wurtzels any distance with profit?—They would principally go to the London market.

23,460. Mangel-wurtzels?—Yes.

23,461. How far from the station would the farmers be generally?—The higher rented ones are pretty close to a station, but those with the lower rent are on the bad roads and some distance from a station—or many of them are.

23,462. Is anything done in the way of smaller vegetables such as lettuces, salads, and so on?—Nothing.

23,463. It is chiefly the bulky root crops?—Yes.

23,464. And potatoes?—Yes.

23,465. Yet there is a profit?—For a generation they have been extremely successful

23,466. Although the railway carriage is not convenient and the roads are bad?—Yes. The roads are not bad for all. Those nearer the town, the heavier rented ones, have no bad roads to contend with.

23,467. (*Mr. Little.*) And they are very good roads in the autumn very often, are they not?—Yes, very good.

23,468. And the produce goes away early?—It often goes away early.

23,469. The most successful men are those who get their produce away early?—That would be so.

23,470. (*Mr. Whitehead.*) What would be about the yield of wheat per acre?—I should think you might call it at from 4½ to 5 quarters an acre.

23,471. And a large yield of straw?—Yes, a fairly large yield of straw.

23,472. Which would be very profitable?—Yes.

23,473. It was profitable last year?—Very profitable.

Owners and occupiers compared.

23,474. Who are the most flourishing in these cases, those who own the small plots or the occupiers of them?—I should say the owners.

23,475. I mean occupying owners of the freehold and occupiers who are tenants?—I have hardly cases enough in mind to reply to that.

23,476. You can hardly say?—I could hardly say.

23,477. I think you told the Chairman that in most cases the small holdings are cultivated by the tenant and his family?—Yes.

23,478. Without any hired labour?—Yes.

Small holders and ordinary farmers compared.

23,479. Compared with other tenants in the neighbourhood—ordinary farming tenants—what would their relative prosperity be?—It is difficult to say. I think that a few of our largest fen farmers have been prosperous during the last ten years, but some of them are of exceptional ability. I think the smaller ones have not been so prosperous.

23,480. Then you can say that these small holders have not been so prosperous as the ordinary farmers?—I think that neither the ordinary farmer nor the small holder has been prosperous these last two years.

23,481. Not even in this favoured district?—Not during the last two years.

23,482. But then they are handicapped by the large rents they pay?—I think they are handicapped very severely by their rents.

Potatoes.

23,483. You mentioned the blackness of the potatoes. Were you alluding to the blackness which comes in the spring from long keeping or the blackness which comes from disease?—Neither; but all potatoes grown on fen land show a little trace of blackness about them; they all cook black or dark.

23,484. Would that be so in the early part of the season?—Not so much then, but they do, I believe, during the whole season more or less.

23,485. Not from disease?—Not from disease.

23,486. Are you aware that there is a new kind of disease which has appeared lately in some potato districts of that same nature, namely, that the potatoes are black inside, which is supposed to be due to a fungus; is that the blackness you are speaking of?—No, it is not that blackness; it is simply a natural blackness owing to the soil.

Copyholds. Enfranchisement.

23,487. Why was not complaint made to the Board of Agriculture that their scale had not been adhered to in the case of the enfranchisement of the copyhold you were speaking of?—Do you mean in the case of the valuers' charges?

Mr. W. H. Clarke.
8 June 1894.

23,488. In all cases where their scale has not been adhered to as you have told us; would it not have been right to have pointed it out to them?—Take the two cases I mentioned; first of all the valuers' charges; I had no specific complaint to make in the case I mentioned, but I thought it was hard upon the tenants when they had no knowledge of what they had to pay in connexion with these things. With regard to adhering to the scale for compensation for the enfranchisement itself it was a special part of my bargain that I should not draw the attention of the Commissioners to it.

23,489. Then it should not have been complained of, should it?—Yes, I think it should, because I only gave it as an illustration that the scale was not recognised, as many men who do not recognise it often are in the position of umpires. I think it ought to be more strictly laid down.

23,490. But in that case it was, in point of fact, contracted out of, as one might say?—Yes.

Rents.

23,491. (*Mr. Clay.*) Who fixes these rents for the small tenants. Do you fix them yourself as land agent?—In some cases.

23,492. Is there no public competition?—None whatever. Many of the small lands in our neighbourhood are owned by little men, men who have just two or three pieces of land as their whole property to live upon, and they let those plots themselves.

23,493. I did not gather from you very clearly what is the average rent of those small holdings?—The average rent of these small holdings of three acres and three roods is 8*l.* 10*s.* That is something like 2*l.* 5*s.* an acre, I think.

23,494. What is the average rent of the land lying alongside, which is farmed by what you would call the larger farmers?—Something like half the money.

23,495. What is the reason for charging what is practically two rents for the small holdings?—In my individual case it is for this reason: that my employers are solicitors who are trustees for a lady who wants every shilling of her money; it was originally a bad mortgage, and she requires the money as much as the tenant does, so I am bound to make the best of it.

23,496. You are squeezing that much extra money out of the small tenant in order to keep the old widow up?—I quite allow that it is wrong, and I have given you my reason for doing it.

23,497. You are a party to it, I mean?—I am a party to it; I am sorry to be.

Cost of arbitration.

23,498. (*Mr. Little.*) You have told us about a case where the amount awarded was very much less than the costs of the arbitration. Do you happen to remember how much of the costs was the umpire's fee?—Yes, I think I do; I know it was less than my own.

23,499. I do not mean that; it was no very large portion of the costs?—No, it was not.

Small holders.

23,500. With regard to the small holders I think they are strictly confined to one description of soil, are they not?—They are.

23,501. You have in the parish two or three different kinds of soil such as clay and gravel on the high land, and then you have this fen soil?—Yes.

23,502. The small holders of whom you are speaking are all upon the fen?—All those that pay heavy rents.

23,503. And they will not touch any other part of the parish?—They will not.

23,504. Therefore the system is one which has grown up in consequence of the soil being particularly suitable for this cultivation?—It is so.

23,505. It does not extend to other parts of the district which are less favourable; it would be very difficult to extend it to the high lands?—You could not extend it to the high lands.

23,506. Not with any success?—No.

25,507. These small divisions of land date from two centuries back, I suppose; the fens were divided then?—I think that these were not laid out quite so long ago as that, but I cannot give you the date.

23,508. Was there not a considerable partition of the fens in the 17th century?—Yes, but I think these were subsequent.

23,509. Some portion of each parish was then laid out in large plots which still remain as large farms?—Yes.

23,510. And some portion was laid out in equal doles to each commonable messuage?—That was so.

23,511. And those still remain divided properties?—Yes.

23,512. There has been very little amalgamation of them?—None.

23,513. There has been very little division of the large farms?—Very little.

23,514. And the large and the small run side by side?—Yes.

23,515. The large farms and the large estates of to-day were large in the 17th century, and the small plots and the small properties of to-day were small in the 17th century?—That is so.

Roads.

23,516. With regard to the roads, these occupation roads are rather extensive in a fen parish, are they not?—They are very extensive with us.

23,517. Particularly where the land is divided into small plots?—Since this development of the root trade they have been very much worse.

23,518. When the whole of the produce is removed the traffic on the roads is very considerable?—Very.

23,519. Thirty tons of mangel wurtzel per acre, I suppose, would be grown frequently?—Yes, and more.

23,520. So 30 tons of mangel wurtzel would be carried along the road and also the whole of the corn crop too is removed up into the town?—Yes.

23,521. The whole of this produce is moved on these roads which become bad in the month of October probably?—They do.

Highway rates.

23,522. These lands all pay highway rates?—Yes.

23,523. They are rated pretty much up to the rent?—They are.

23,524. Therefore they pay a bigger highway rate than many lands which have a road close to them?—That is so.

23,525. That is rather unfair to the occupiers?—It is.

23,526. You desire to see some scheme by which these roads could be improved, and that improvement facilitated by giving the county council power to order the roads to be made partly at the expense of the owners?—Yes.

23,527. And partly at the expense of the ratepayers of the whole parish?—Yes. I quite recognise that if the owners had not to pay a considerable sum for these roads a parish would almost be impoverished by taking steps to remedy the neglect of the past, such a parish as ours for instance would.

23,528. Do you think that if a portion of the money, or the whole of the money were borrowed and the capital sum were repaid in a series of years, the owners should be rated towards that improvement?—That is so.

23,529. The thing would then be practicable without an exorbitant tax upon the occupiers?—That is so.

Owners and occupiers compared.

23,530. As to the comparative success of the occupying owner and the tenant, I suppose where there is a heavy mortgage the occupying owner is, if anything, in a worse position than the tenant?—I should have given a very different answer to Mr. Whitehead's question if I had imagined that it applied to anything but the occupying owner of one of these small lots.

23,531. I am entirely confining this question to the small holdings. You were asked which was the most prosperous, the man who farmed his own land or the man who hired; that depends, does it not, entirely upon whether the man has got a mortgage?—Entirely.

23,532. Most of these small holders, I suppose, would have a mortgage?—Several of them have.

23,533. And the whole thing would turn upon the amount of the mortgage?—Yes.

23,534. (*Mr. Everett.*) What rent would land of similar quality to this that is occupied in the smaller holdings make if it were in grass? I suppose you have some of it in permanent grass?—It would not lay down to permanent grass. The grass would run out in a few years; every year it would get worse really.

Small holders and agricultural labourers compared.

23,535. What is the comparative condition of the people in the villages where these small holdings prevail, as compared with the people in villages in the same district composed of ordinary agricultural labourers; which are the better off do you think—the agricultural labourers working for masters or the small tillers?—I think that these small holders have been better off, because they have been agricultural labourers, many of them, who had got rather forward in the world before they took these plots.

Mr. W. H. Clarke.

8 June 1894.

23,536. But in the last few years they have been going back?—In the last few years they have been like some of the farmers. I think the landlords are exhausting them before they relieve them.

23,537. (*Viscount Cobham.*) Are there families employed upon the land?—Yes, they are employed very much upon the land.

23,538. They do not go away to other occupations?—No.

23,539. (*Mr. Everett.*) Where any of this land is near water carriage, by which the produce can be sent to London, does that add considerably to the value of the land?—Yes.

Water carriage.

23,540. I mean water carriage as compared with railway carriage?—We have some lands upon the other side of the town identical with these in quality, but having water carriage to them they have to go by water to the rail and then to be put on the rail, that prevents them having any carting down bad roads, but it adds a little lighterage to their expenses.

23,541. People cannot send by water the whole way to London then?—No.

23,542. I have been told that part of the fen land which has a good water approach over which it can send its produce direct to the London market by water has not gone down in value at all?—I should not have thought there would have been such fen land. I do not know of any, but it is possible there may be some. This fen land that I have been speaking of in small quantities will sell to-day at a higher price than I ever knew it to sell in my life.

Value of fen land.

23,543. Even now?—To-day. I was interested in three of these lots lately; two were sold by auction and one by private contract. They were less than four acres each, as I said before, and they made 240*l.* each.

23,544. Now—recently?—Yes, one of them I sold certainly in November, and the two others in October.

23,545. Were they bought by people intending to occupy them?—No, they were bought for investment.

23,546. By what class of people?—A butcher bought one and a cattle salesman bought two. They pay over 5 per cent now.

Rural depopulation.

23,547. (*Viscount Cobham.*) Have you any other point you would like to bring before us?—There is one thing I thought might be of some interest. In some of the villages in our neighbourhood depopulation seems to have been going on rather during the last two or three years, although they showed no traces of it previously. There is a village called Mepal, I have practically a large proportion of that land and the cottages there in my charge. It was a most thriving prosperous village apparently, within three or four years, with a great demand for cottages. To-day the cottages are beginning to empty, and the village is showing altogether signs of the depression far more than it had done in the previous eight or nine years.

23,548. Are there small holdings around Mepal?—I wrote to the Rector of Mepal with reference to it, and he has given me some little account. There are some small holdings there, and I had always understood there had been fairly prosperous. He says in his letter: "The farmers principally work at manual labour"—so that they are nearly all now small holders or partaking of that character—"and their sons remain "at home. We have several very small occupations "from 10 to 15 acres, and they try to live upon them, "but I feel sure they are worse off than a good agri-"cultural labourer who can take his wage on Satur-"day." Then he gives me a list of the men. The outcome of it is this: that the land has got entirely out of the hands of the ordinary farmer, or a large proportion of it, and it has got to the labourer, who is a very hard working man. I let a farm there the other day to a man who was a labourer only about 15 years ago. Now he is taking nearly a 100 acres of land, and he paid me a heavy sum on it. He has gradually saved sufficient to enable him to do this. The village in consequence is going down because these men simply employ their own family.

Mr W. H. Clarke. 8 June 1894.

23,549. On about 100 acres?—Yes. The rector says about this one man that on 60 acres—I see it is—he employs one labourer.

23,550. Are the small holdings diminishing in that village?—They have not very suitable land there—nothing like so suitable land as we have. Their land is not so good as ours and they have no rail within three or four miles of them.

23,551. Do you see any signs of depopulation at Chatteris and Wisbech?—No, I think that Chatteris has been a very prosperous village—or small town rather—right through the bad times. *Mr. W. H. Clarke.* 8 June 1894.

23,552. Have you allotments as well as small holdings?—We have a few allotments, but not any large quantity.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Forty-fourth Day.

Thursday, 14th June 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P. (CHAIRMAN).

Viscount COBHAM.
The Right Hon. BARON RENDEL.
The Right Hon. HENRY CHAPLIN, M.P.
Sir NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., *Assistant Secretary.*

Professor HERBERT SOMERTON FOXWELL called and examined.

Prof. H. S. Foxwell. 14 June 1894.

23,553. (*Mr. Chaplin.*) You are, I think, a Fellow of St John's College, Cambridge; Professor of Political Economy in University College, London, and Examiner in Political Economy to the University of London, and the Institute of Bankers?—Yes.

23,554. I believe you have been for many years engaged in studying and teaching political economy?—For 25 years.

Experience in currency and banking.

23,555. Have you also given special attention to questions relating to currency and banking, and will you be prepared to offer evidence upon those points?—My attention was first called to this question of prices about the year 1880 by the late Mr. Jevons, and after that time I dealt more particularly with the question in connexion with a lecture which I gave in Scotland on the causes of irregularity of employment. It was from that time that I began to devote special attention to the question of prices.

23,556. You are aware, I believe, that this Commission has been appointed to inquire in agricultural depression, and that many of the witnesses who have come before us to give evidence have expressed the opinion that the main cause of the depression has been the fall in prices of agricultural produce, and it is on that question that I propose to examine you. I shall do so with the view of enabling you in the first place to put a general sketch of the whole question before the Commission, and then, having done that, I will examine you more in detail upon some of the various questions which no doubt will arise in the course of your examination. The first question I will put to you is this: Do you concur in the opinion which has been expressed that there has been something in the nature of a general fall in prices in recent years, including the prices of agricultural produce; and since when does that date?—Undoubtedly I concur in that opinion, and I should like to lay before the members of the Commission copies of a chart prepared by Mr. Sauerbeck showing the nature and extent of that fall. (*See* Appendix .) I have also prepared a large chart which is now hanging in the room, containing these figures upon a larger scale.

Fall in wholesale prices of commodities.

23,557. You put in this chart I understand with the view of enabling you to show the amount and the general character of this movement?—Yes. *Prof. H. S. Foxwell.* 14 June 1894.

23,558. Will you explain how it does that?—I ought to state, perhaps, in the first place, that the chart is based upon figures as to wholesale prices which have been prepared by Mr. Augustus Sauerbeck. It represents what is sometimes described as an index number. There have been various index numbers, seven or eight, of accredited authority; but after a careful comparison of several of these numbers I have come to the conclusion that Mr. Sauerbeck's is, upon the whole, the most carefully prepared and the one which best represents the general movement of prices.

23,559. (*Mr. Giffen.*) It was prepared, was it not, after the event to some extent, whereas some of the others were prepared before the fall of prices had taken place?—That is true; but I think that we have learnt a little during the discussions which have taken place during the last 25 years as to the principles upon which such index numbers should be constructed, and in particular from the committee of which Mr. Giffen was himself a member. The investigations of that committee have thrown a great deal of light upon the principle of index numbers.

23,560. The chart itself is not Mr. Sauerbeck's, is it?—That chart which is hanging up is not Mr. Sauerbeck's, but this smaller one which I have circulated is; it was published by him in this convenient form at my request.

23,561. (*Mr. Chaplin.*) Is there any material difference?—They are identical so far as I know, except in regard to the letter-press comments.

23,562. And you propose to make use of that chart in order to assist you in explaining to the Commission the effect of what is known as the index numbers?—Yes.

23,563. Upon the whole, you think that probably it is most desirable that we should take Mr. Sauerbeck's index numbers?—I think so; they are the numbers published by the Royal Statistical Society, and they seem to me, on the whole, the best.

Prof. H. S. Foxwell.
14 June 1894.

23,564. The results of the various systems of index numbers are, to a great extent, the same, I believe?—The coincidence is very remarkable.

23,565. But, on the whole, you have selected Mr. Sauerbeck's?—On the whole, yes.

23,566. Will you proceed to explain to the Commission what you desire to convey to them by that chart?—In the first place the percentages are calculated upon a base line taken as 100, which represents the average course of prices for 25 years, the 25 years beginning with 1853 and ending with 1877; that is to say, beginning after the first effect of the Californian discoveries had been produced, and continuing till after the fall had fairly set in, in 1877.

23,567. From 1853 to when?—To 1877 inclusive; that gives you 25 years.

23,568. And the base line represents the average price for those years?—For those years.

23,569. Of how many different articles?—I believe Mr. Sauerbeck has given 45 commodities latterly, but before 1846 there were only 31 commodities so chosen. The explanation of the principle of construction is given, I see, on the smaller chart which I have circulated to the members of the Commission; it is also given more fully in a paper which Mr. Sauerbeck read before the Royal Statistical Society in 1886, and which was published in the Society's journal.

23,570. Could you explain to us very briefly the effect of the chart?—The general course of prices, do you mean?

General course of prices since 1817.

23,571. Yes?—It begins in the year 1817 or 1818, just at the time when the resumption of cash payments was in contemplation. The course of prices before that had been much higher during the Great War; but, starting from that point, we find a general tendency to a fall, slightly checked about the years 1835 to 1840. There is evidently a slight rise there, which is more clearly shown in this copy of the chart that I have myself, upon which Mr. Sauerbeck has drafted an average line. You will see upon the copies which have been circulated, an average line marked by circles connected with dots, but that average line seems to me to be faulty in this respect, that it represents the average of 10 years ending with the year in question upon which the mark is placed. The effect of that is to project the average always, so that when prices are descending the average is a little too high, and when prices are rising the average is a little too low. There is great difficulty in so choosing an average as to get by statistical means a good average representation of a variable course of prices like the one before us. Four or five years ago I consulted several eminent mathematicians on this point. Amongst others the President of the Royal Society was consulted, and he expressed the opinion that there was only one satisfactory way of doing it, namely, by a hand drafted average; and that to avoid the suspicion of bias it was better to get the drafting done by a person who had nothing before him but the simple diagrammatic expression of the curve. I have here an average drafted, I believe, by Mr. Sauerbeck himself, but very fairly drafted, I think, in that way; and I should very much prefer, if I had time, to substitute that for the dotted line which appears on the copies which are circulated. If that average is followed it appears very clearly that there was a slight rise of prices about the years 1835 to 1841; after that the general fall was resumed, and continued until roughly about the year 1850, which marks the time at which the discoveries of gold in California and Australia had become important, and had begun to produce a decided influence upon prices. After the year 1850 we have a very considerable rise—a very remarkable rise, which attracted much attention at the time—up to about the year 1854; after which we see fluctuations due to speculative causes continued at a high level—at a level which I should say was slightly rising. That, again, comes out very clearly in the drafted line. The level is slightly rising for the period from 1853 to 1873, but we have the usual speculative fluctuations during that period. After 1873 it is clear that there is a very marked and continuous fall. What is most remarkable about that fall, I think, apart from its long duration, is its remarkable continuity, the very slight extent to which it is broken by speculative disturbances, otherwise I have only to call attention to its magnitude. The fall is from an extreme point of 111 in 1873—an average point of about 102—down to (when the last annual average was taken) 68. From the latest information that Mr. Sauerbeck has sent me, I find that the index number for May is 64, so that there has been a steady fall during the early part of this year from 68 to 64.

Prof. H. S. Foxwell.
14 June 1894.

23,572. To what do you attribute this general fall, which is indicated by the chart you have put before us?—Perhaps it would be convenient that I should analyse the curve to some extent, and explain what part of the variation I attribute to currency causes.

Different causes of fluctuation in prices.

23,573. Yes; will you state what are the causes to which you attribute the various fluctuations?—I wish to say that for the purpose of analysis, I think it is sufficient to remark upon three different causes of the fluctuations which we see given us in any such curve of prices. In the first place, you have fluctuations which are of a more or less accidental and temporary kind, due to fluctuations in demand and supply of commodities, and so forth, which we may describe as market causes, causing the peculiarly characteristic shape of that curve in particular places. Then it has been pointed out by economists for a long time past that there has been a tendency—at all events, there was a tendency up to the year 1873—to a fluctuation of a longer period, and, generally speaking, cyclic or periodic in its nature—a speculative fluctuation: a rise of prices during one portion of the period, followed by a fall, after the collapse of the speculative prices, and generally speaking occupying a period of some 10 years—or something like 10½ years as the late Professor Jevons thought. I think that that is pretty obvious upon the curve. It is pretty obvious that, besides those peculiar market fluctuations which give it an irregular character, there is a wave, a periodic fluctuation, every 10 years. That is fairly marked until you get to 1873, after which the curve becomes very continuous, I admit. I do not attribute that variation to the causes of which I wish to speak particularly to-day; I attribute that mainly to a speculative movement which seems to recur in that way; it has recurred, at all events, in the past at something like that interval of 10 years. But after setting aside the fluctuation due to market causes, and the fluctuation due to this speculative cycle, as it has been called, this credit cycle, there still remains an underlying movement, a sort of tidal movement, which has been called by the French mathematician and economist Cournot a great secular movement, because it goes on for long periods of time in the same direction. I wish to lay very great stress upon the character which distinguishes that movement: that it is not a movement which, as a rule, tends to correct itself. After the rise of prices owing to the speculative causes, you will probably get a fall. It was put to me once, I remember, by a merchant in Sheffield: "We do not understand "the present state of prices. We are accustomed to "expect four or five good years, and then four or five bad "years, and that we understand and are able to deal "with; but here we have a persistent movement." That persistent movement is in my opinion the underlying currency movement; and if you take the whole period before us here, from 1817 down to 1893 or 1894, you will see that from 1817 to 1850 there was a general currency movement in the direction of a fall of prices—at all events, a general movement which I will attribute as a matter of opinion to currency causes. After 1850 there is again a general movement, quite apart from the speculative movement to which I have referred, in the direction of a rise, terminating in 1873. After 1873 it is equally evident that there is a general movement in the direction of a fall.

23,574. What you mean to convey to us, I think, is this: that in your opinion there are three causes to which you refer these fluctuations in prices?—Yes.

23,575. One cause you describe as a market cause; the second cause you describe as the credit cycle cause?—Yes.

23,576. And those will, I understand, be always more or less liable to cause fluctuations?—Yes.

23,577. But over and above those, or underlying those, there is a greater or more permanent cause which you attribute to currency causes?—Yes.

23,578. (*Mr. Giffen.*) Would you not rather say "monetary" in preference to "currency"?—Yes, I think so. Both terms are rather ambiguous, but I do not object to the term "monetary."

23,579. (*Mr. Chaplin.*) We will deal with that afterwards; for the present it is quite sufficient to say that this permanent rise or fall underlying those other two

Prof. H. S. Foxwell. 14 June 1894.

causes you attribute to monetary causes?—I believe I use the term "monetary causes" in my notes of evidence, and perhaps I might repeat the expression here. The third kind of movement appears to me to be due to the scarcity or excess of the substance which forms the standard of valuation—in England, gold.

23,580. You distinguish between three causes, and it is necessary to do so carefully, I believe, in order to arrive at an understanding of the question?—I think so. I would observe that there has been great confusion on account of the fact that this distinction has not been recognised. Tooke has been referred to several times, I understand, in the course of recent discussions. Tooke, it appears to me, failed to grasp the nature of the third kind of variation. He was immersed in business no doubt, and practised in business, and was accustomed to study and observe market movements, and also the speculative movements; and I think that that, to some extent, disqualified him from seeing the general underlying movement. His mind was occupied with the details, the surface movements, if I may call them so. At any rate, there is no doubt that he did deny to a great extent the fact of the third cause which I have here mentioned.

23,581. (*Mr. Giffen.*) I do not think he quite denied the possibility of it, did he?—His argument appears to me to have been rather of this nature: there are sufficient explanations without taking that consideration into account.

23,582. (*Mr. Chaplin.*) Men engaged in business, I suppose, would be apt to refer all movement in prices, probably to the first opinion?—I think so; I think there is that tendency.

23,583. And you think that Tooke was rather governed by this view also?—I think so.

23,584. Are your views as to Mr. Tooke's opinion upon prices shared by other economists?—I believe so generally. They were certainly shared by Jevons, who, in his investigations of currency and finance, criticised Tooke's view, and said that we must admit the currency variation.

23,585. It has been held, I think, that Tooke's opinions have been rather superseded by those expressed by Jevons?—I believe that Mr. Giffen has held that view, and I certainly should endorse it strongly. Mr. Tooke, I think, was not accustomed very much to broad generalisations; I do not think that he had received that kind of training.

23,586. Shall I express your views if I say this: that although the two first causes you have named, namely, market causes, and credit cycle causes, have not been without their effect on the general course of prices since 1873, yet you consider the fundamental character of the movement in prices is due to monetary causes?—Undoubtedly.

23,587. (*Mr. Giffen.*) Mr. Tooke did not exclude the credit causes that you refer to, did he?—No; he did not exclude the credit cause. I ought to have said, perhaps, when speaking of Mr. Tooke, that Mr. Tooke's views were set aside by Parliament in 1844, when the Bank Act, the principle of which was supposed to have originated with Lord Overstone, was passed. Lord Overstone had always combated that opinion of Tooke's, and had maintained that the quantity of currency, by which he meant principally the quantity of note currency, had an important influence upon prices. I think we ought to recognise the fact that Parliament did set aside the opinion of Tooke in that case, and adopted the contrary opinion of Lord Overstone. Jevons, I think, would now be regarded as the classical authority, perhaps, on questions of the analysis of prices; and he distinctly, in the same way, insists upon the necessity of recognising this underlying cause to which I attach great importance.

23,588. Still it was rather a different point upon which he (Tooke) was overruled by the legislation of 50 years ago?—That was a rather different point; but it implied the same principle of the importance of the quantity of money.

23,589. But still it is the importance of the quantity of currency which we should consider?—Yes.

23,590. More than the quantity of standard money?—Yes, undoubtedly.

Effect of monetary changes of 1872 on prices.

23,591. (*Mr. Chaplin.*) Now, would you explain to us what you mean by the currency cause to which you attribute this fundamental character of the movement?—Are you speaking of the monetary change of 1873, and not of any other change?

Prof. H. S. Foxwell. 14 June 1894.

23,592. Yes?—With regard to the movement of prices in 1873?

23,593. We will deal with that first, please?—It appears to me to be due, no doubt, in the first place, to a scarcity of gold brought about in my opinion mainly by the demonetisation of silver, or what is generally spoken of as the demonetisation of silver, although of course it was not a complete demonetisation—it was a partial demonetisation, commencing in the year or about the year 1872–73. It was followed by a loss of the par between silver and gold, and the general fall of prices to which I have alluded.

23,594. When you speak of the demonetisation of silver, and, as I observe in your brief, of various measures restricting the monetary use of silver, do you refer to the legislation of various countries which resulted in the closing of the mints to silver?—Yes. I refer primarily to the adoption of a gold standard by Germany, the subsequent sales of German silver, the closing of the French mints to silver in 1873, or rather the commencement of the measures which ended in the absolute closing of those mints, and various other demonetisations of silver by other governments. I have a list here.

23,595. Previously to the time of which you speak the mints of France and certain other countries on the Continent were open to the free coinage of silver, I think?—The mints of France and of the Latin Union were; for practical purposes I think, we may say France, because the importance of the French mintage was so much greater than that of the other countries involved.

23,596. That is to say, that all the silver that was found anywhere in the world could be brought to these mints and converted into coin?—Yes.

23,597. And when it was converted into coin, I understand that it became legal tender money, that is to say, money in which debts could be discharged?—Yes. I wish to say that the conversion into coin, though it may have been the most usual way of dealing with the silver that was purchased, was not essentially the necessary way. The essential point of the transaction was that, in return for the metal, there was given back legal tender. Whether the metal was coined, or whether it remained in bars, was from that point of view perfectly indifferent; the essential thing was that the metal became money in unlimited quantities, and that there was a market open for unlimited quantities.

23,598. It became practically legal tender money available for the discharge of debts?—Yes.

23,599. Then silver at that time, if I understand you rightly, was placed in that respect by law in the same position which the law gives to gold now?—In England, quite so.

23,600. Am I right in understanding you to mean this: that all the silver as well as all the gold that could be found at that time was, so to speak, under the existing law in France and these other countries, potential money, and could be made available for that purpose?—Yes.

23,601. As a matter of fact, I suppose, a large quantity was made available, and in this way the volume of legal tender money in the world was steadily increased year after year, partly by silver and partly by gold?—Yes.

23,602. What effect did that have upon prices at that time; was the volume of money sufficient to keep prices steady?—Certainly; it follows from the curve that we have been considering, that the supply of the precious metals up to this time in the shape of money had been sufficient to maintain prices, or at all events, that prices had been maintained.

23,603. In 1873 there was a change; the law was altered and certain measures were carried. Have you the list of those measures?—Yes.

Demonetisation of silver in Europe.

23,604. Can you state the principal ones?—I have taken this list from the report of the United States Mint for 1893, pp. 22–24, and it seems to me to be a convenient list; but there is a more detailed list in Mr. Ottomar Haupt's book, *Arbitrages et Parités*. 8me edn, pp. 77–79. First, there was the adoption of a gold standard by Germany in 1871 and the sales of German silver beginning in 1873 and ceasing, as I understand, in 1879. It is understood that Germany has a considerable

Prof. H. S. Foxwell. 14 June 1894.

amount of silver still unsold—nearly one-half, according to my information. The second case of legislation mentioned is the case of Norway, Sweden and Denmark, who concluded a monetary treaty in 1872, which was ratified by Sweden and Denmark in 1873, and by Norway in 1875, for the adoption of a single gold standard. Then there is the case of Holland. Holland had used silver since 1847. In 1875 she introduced what was nominally a double standard at the ratio of $15\frac{5}{11}$, but the coinage of silver was prohibited; so that for practical purposes she was very much in the position that France is in now. Then, fourthly, the Latin Union by the treaty of January 1, 1874, agreed to limit the amount of five-franc pieces—that is to say, the legal tender silver money—to be coined by any country. Up to that time it had been unlimited, so far as the Convention of the Latin Union was concerned. But France had already begun a restriction on mintage, which produced its first effect in the shape of a delay imposed upon those who brought metal to the mints to be converted into coin.

Closing of the French mints.

23,605. Can you state the date at which the limit was first imposed?—The whole history of the thing is very minutely given by Mr. Hucks Gibbs. I have his tract here; I do not know whether it would be possible to read it entirely. Mr. Hucks Gibbs has described the whole series of restrictions in a tract entitled, "The "fall in the gold price of silver, and the closing of the "French Mint." This tract is founded largely upon information directly received from official sources by Mr. Hucks Gibbs. It appears that up to the date of the 6th of September 1873, there was no legal limit placed upon the coinage of silver in any sense, either as regards the quantity to be received, or as regards the due-dates of the *bons-de-monnaie*, or legal tender warrants which were issued against it. But on the 6th September 1873, a ministerial order directed that the mintage of silver five-franc pieces should be restricted to 200,000 francs per day in Paris, and 80,000 in Bordeaux. This was the first restriction of the free mintage of silver in France. From that period of the 6th of September 1873, owing, I suppose, partly to the agreement of the nations of the Latin Union to which I have referred, there was a continual increase of the delay, or of the time which must expire before the person taking the metal to the mints received back the legal tender money in return. That, of course, had the effect of a seignorage; it was the same thing as imposing a charge upon mintage. This charge steadily increased; but I do not think it is necessary perhaps to mention the various stages by which it was increased.

23,606. I do not know that that is of very great importance; can you state when the mint was closed?—The mint was absolutely closed by the law of the 5th August 1876, to the receipt of silver bullion, but it did not take effect, so far as the issue of coins was concerned, in that year.

23,607. Are you now searching for the exact date of the closing of the mints?—Yes. The law was passed on August 5th, 1876, and no legal tender 5 franc pieces were coined after 1878. I will verify those dates.

Suspension of silver coinage in Austria and Russia.

23,608. The right of free coinage, so to speak, ceased, I think, either in 1873 or 1874?—If by free coinage you mean coinage without any charge other than the ordinary seignorage, certainly that did cease on the 6th September 1873. Then Russia suspended the coinage of silver, except in the case of trade coins for use in China in September 1876. Austria suspended the free coinage of silver in 1879, and adopted a gold standard in 1892. Then we come to the case of the United States, which can hardly be spoken of as a case exactly of demonetisation, because the United States, up to the year 1873, had been practically using inconvertible paper, and very little, if any, coin. In 1873 the gold standard was adopted by the United States in this way—the legal tender silver dollar was slipped out of the list of authorised coins. An Act was introduced regulating the operations of the mint, and the legal tender silver dollar was omitted from that Act, which was equivalent to a demonetisation, the remaining silver coins being merely token or fractional money. Silver was still purchased by the United States after 1873 for trade dollars, for use in the East, and it was also purchased to replace fractional paper currency in the years 1873-75. The Indian Mints were closed on the 26th June 1893. I think that completes the most important measures, at all events, affecting the use of silver as legal tender money.

Adoption of the gold standard by the United States.

Closing of Indian mints.

23,609. (*Mr. Everett.*) You have not named Italy, have you?—No, Italy is not given in this list. Italy adopted the gold standard. [The decree for the resumption of cash payments was issued on 1st March 1883.]

Prof. H. S. Foxwell. 14 June 1894.

Adoption of gold standard by Italy.

23,610. (*Mr. Giffen.*) In 1885 or 1886, was it not that Italy adopted the gold standard?—I think it would be something like that date.

23,611. I know I gave evidence about it in 1887, and I spoke of it as going on at that time?—Yes; it would be about then.

23,612. (*Mr. Chaplin.*) Was Italy one of the countries in the Latin Union?—Italy was one of the countries in the Latin Union.

The Latin Union.

23,613. I think I am right, am I not, in saying that the mints of France, and all the other countries in the Latin Union were closed practically about the same time?—To silver, yes.

23,614. Would you state what are the countries of the Latin Union?—There is a convenient history of the Latin Union given by Mr. Henry Chevassus, which was read before the Institute of Bankers in the year 1886, on October 20th. I have a very short abstract of the paper here. The Union was first proposed to France by Belgium, with a view to the adoption of a gold standard, in 1865, and it ultimately included France, Belgium, Italy, Switzerland, and Greece, which came in later than the others.

23,615. (*Mr. Giffen.*) What time did Greece come in?—I do not know that, but I can give you the date, 1868.

23,616. But there was no agreement amongst them to coin at a ratio?—There was no agreement for free mintage.

23,617. There was an agreement to accept the coins mutually when coined; was not that the nature of it?—I think it went further than that—that they would coin certain specified coins at the ratio of $15\frac{1}{2}$, and at a given standard, a line being drawn, of course, between the legal tender coins and the token coins.

23,618. (*Mr. Chaplin.*) At all events, up to that date of which you are speaking in regard to those countries, that is to say, France and the other countries of the Latin Union, which I think you say included France, Belgium, Switzerland, Italy, and afterwards Greece, silver could be taken by right to the mints of those countries, and they were compelled to take it and deliver legal tender money in its place?—But not under the Latin Union; it was so as a matter of fact by the national regulations of the various countries.

23,619. (*Mr. Giffen.*) That would not apply to Italy, which was a country of inconvertible paper?—There would be no *de facto* coinage there. I have here the Convention summarised, if the Commission would be interested in hearing the exact terms.

23,620. (*Mr. Chaplin.*) The Convention was passed at what date?—In 1865.

Effect of the monetary changes.

23,621. I will ask you about the earlier dates afterwards. What is your opinion as to the main results of these monetary changes which you have been describing?—It appears to me that they necessarily caused a contraction of the monetary basis of the world's prices—what I should call the world's valuation—by, to a very large extent, excluding silver which otherwise would have been presented at the mints and would have been turned into legal tender money, and would have supported prices.

23,622. I understand you, that the first effect then would be this, that there was an increased demand for gold due to the disuse of silver?—Yes, undoubtedly; and that was a demand which Mr. Goschen estimated at 200,000,000*l.* sterling about the year 1879.

23,623. And then, taken in conjunction with the expanding wants of the world, the requirements of the newly opened-up countries would greatly increase the demand for gold?—Necessarily; and, I may add, at a time when the production of gold from the mines was falling off.

23,624. There was no corresponding additional supply of gold at that time, I understand?—No, the supply was diminishing from the highest point reached in 1852.

23,625. Consequently, the value of the metal would naturally rise?—It would necessarily rise, if we take into account the increase of population and the opening up of other countries.

23,626. That would bring about a fall in prices?—It appears so to me.

23,627. Then should I be right in saying that in your view the first result of these monetary changes was to cause what is known as the appreciation of gold?—Yes. Might I put in the figures of the falling off in the supply of gold which might be interesting?

Appreciation of gold.

23,628. If you please?—The supply was exceptionally large in 1852; it is stated to have been 36½ millions; but if we take the next year, 1853, which is more representative, it was 31 millions; in 1874, the supply of gold had fallen as low as 18 millions; and it was just at that time that additional work was thrown upon gold by the partial demonetisation of silver.

Divergence of relative values of gold and silver.

23,629. Then the appreciation of gold having been the first result of these changes, what other effect did they have; did they cause a divergence in the old relative values of the metals?—Yes, the ratio between gold and silver, which, to use Dr. Soetbeer's words, had shown remarkable stability from the year 1687, and had not varied very considerably from the point of 15 to 1 in the 18th century, and 15½ to 1 in the 19th century rapidly—I hardly know whether to say the ratio rose or fell, but the value of silver fell, as shown by a rise in the nominal ratio. The ratio starting at about 15½ to 1 in 1873 has risen to something like 34 to 1 in 1893, with a corresponding fall in the gold value of silver.

23,630. Then these monetary changes were followed at all events in addition to the appreciation of gold by this other consequence; that the relative value of the metals which up till that date had been about 15½ to 1, widened very greatly, till at last it has reached something like 34 to 1 at the present day?—Yes, perhaps 33 now.

23,631. And that process of divergence has been going on pretty nearly continuously since that date, I think?—Very nearly continuously, with the exception of a rise produced by American legislation in 1890.

23,632. In 1890 and 1891 there was a rise, was there not?—Yes. Perhaps I ought to say in reference to that point that I think I used the expression "Fall in "the value of silver:" which was an incorrect expression. The value of silver had been steadily maintained up till the year 1892: it had only fallen in relation to gold. I should have said a fall in the gold value of silver. It is gold which has risen, that is the factor in the situation which has altered; speaking merely of the period down to the beginning of 1893.

23,633. (*Mr. Lambert.*) You mean silver in relation to other commodities?—Silver in relation to other commodities has remained relatively stable; it has not seriously varied.

23,634. (*Mr. Everett.*) The change between the two metals has been a change in the value of the gold?—Yes.

23,635. Not a change in the value of the silver?—That is the way in which I regard it, undoubtedly.

23,636. (*Mr. Channing.*) Is that only down to 1892?—I except the year 1893, because since that time undoubtedly silver has absolutely depreciated in relation to commodities owing to the exceptional legislation of 1893.

23,637. (*Mr. Chaplin.*) By that do you refer to the closing of the mints in India?—Followed by the repeal of the Sherman Act.

23,638. Then may I take it as your general view that a consequence of these monetary changes has been first, the appreciation of gold, and secondly, a very wide divergence in the relative value of the two metals?—Certainly.

Authorities supporting view that gold has appreciated.

23,639. Now I should like to ask you some questions bearing upon each of these two points. First, as to the appreciation of gold. I believe that the fact of the appreciation is still disputed in some quarters, is it not? Can you state any other authorities in support of your view?—I think you could hardly say that it was disputed in very important quarters. There is one economist who has disputed it, namely, Dr. Forsell.

23,640. I am afraid I have heard the present Chancellor of the Exchequer dispute it, and I should regard him as a very important authority. (*Mr. Everett.* And the late Prime Minister.)?—Perhaps I had better put in authorities in the other direction without any further comment.

23,641. (*Mr. Chaplin.*) Can you cite any other authorities in support of your view that gold has appreciated?—I should like to cite in particular Mr. Goschen and Mr. Giffen.

23,642. We have had Mr. Giffen's evidence upon this subject, but we should be glad to hear it again?—The first quotation I have is from a speech of Mr. Goschen in the House of Commons on the 19th February 1883. It is reported in these words: "His point was this—"that as the result of inquiries that were now being "made, it appeared that there was—what could scarcely "be denied—a considerable appreciation in the value "of gold; and that that appreciation in the value of "gold had had a general effect on the prices of almost "all commodities, unless there were very special "counteracting circumstances." The last clause seems a little peculiar. I should have said that the general effect was produced in any case, although in certain cases there might have been counteracting circumstances which neutralised and obscured it.

23,643. (*Mr. Giffen.*) Then he speaks of the appreciation of gold as a cause instead of describing it as the same thing as a general fall of prices?—No doubt he means rather what you have described yourself in another place as a monetary cause when he says it is due to the appreciation of gold. Of course to ascribe the fall of prices to the appreciation of gold is as you say, merely putting the same fact in other words. What Mr. Goschen probably means is that he refers it to a monetary cause; I take it that that is the sense of it.

23,644. The distinction is not always clear to me. Nobody who has disputed the appreciation of gold, to my knowledge, disputes the fact of a general fall of prices?—No, certainly not. Then Mr. Goschen, in 1893, on the occasion of the debate of February 28, says: "I "do not know that the general view that the lowering "of prices is caused by the appreciation of gold could "be seriously questioned." There may be some difficulty in the form of expression, but the meaning, I think, is clear.

23,645. (*Mr. Chaplin.*) What was the date of his first speech?—In 1883, and the second was in 1893. Mr. Giffen, in December 1888, in a paper read at the Statistical Society on "Recent Changes in Prices and Incomes Compared," says: "The fall of prices in such "a way as to amount to what is known as a rise in the "purchasing power of gold is generally, I might almost "say universally, admitted." In the same paper he also says: "The quantity of money in supply and the "demands upon it were certainly assumed to have "some connection with prices, the theory of the connection having never before been disputed to my "knowledge."

23,646. That was in what year?—1888. Mr. Giffen goes a little further in his Essays in Finance, and argues that a fall of prices may be regarded as the normal condition of things, because improvements in the production of the metals, even if they were proportionate to those in the production of the commodities, would only affect the small annual increment of money which is added to the general stock, and would not produce an equivalent increase in the volume of the total stock of money, as they do in the volume of the total stock of commodities.

23,647. (*Mr. Giffen.*) Can you give me a reference?—I am sorry to say that that is a passage to which I have not the reference. I have, I believe, in almost every case, the reference, but for some reason I have not that; I believe I could easily find it. It interested me very much when I read it, which was some years ago, and I put it down at that time, but I was not so careful about my references then. Here is a passage to which I have a reference, in the Essays in Finance, volume 2, page 30, in which the same idea, I think, occurs:—"There is an intrinsic difficulty in the way of an "increase of a standard metal used as money proportionate to the increase of the commodities which "it moves. As the latter"—the commodities—"are "renewed incessantly, an increase of the means of "production increases the whole mass on the market "at any given time. As the precious metals in use, "however, exist in masses enormously greater than "the whole annual production, an increase of the "means of production equal to what takes place in "other commodities only means in the case of gold "an increase of a fraction of the whole mass in use. "There is accordingly a permanent tendency to change "in the relation of commodities to gold." That was

Prof. H. S Foxwell.
14 June 1894.

the passage I had in mind, and I had mislaid my notes. Then Mr. Giffen, in 1888, in the debate on the paper to which I have referred, in reply to Mr. Bourne, pointed out what he has just remarked, that a fall of prices is an appreciation of gold, and that that must be taken to be the meaning of the phrase "Appreciation of gold;" and in that expression of opinion Professor Marshall, and others who were present, concurred.

23,648. That was the view of Professor Jevons, I think?—It was. Then Mr. Giffen goes on—these are my words not his: 'If you ask the further question as 'to the cause of the alteration in the ratio between 'gold and commodities'—this is Mr. Giffen's answer in his own words: "You can say positively that as "between the two periods, 1850-70 and 1870-88, there "is an obvious and palpable change in the movement "of one of the factors, namely, the metal, which you "do not observe in the movement of the other factor" —that would be the commodity; the change, in fact, had been on the side of the money. There are many other passages in Mr. Giffen's well known essays, where he points out the contraction of gold following upon the events of 1873, and foretells that there will be a contraction of prices, a fall of prices corresponding to it. I, perhaps, need not quote those passages.

23,649. (*Mr. Chaplin.*) Then we may take it, I suppose, that in your view the high authority of Mr. Giffen is at one with you with regard to the effect of the appreciation of gold?—I think so.

23,650. That is what you gather from his statements?—I should perhaps like to mention this: Mr. Goschen referred to this point in his speech of February 28th, 1893, when he quoted Mr. Giffen's view to that effect. Unfortunately in the published report of that speech the whole effect of the quotation was altered by the omission of the word "not," and Mr. Giffen was reported to have said, as quoted by Mr. Goschen, that "We cannot know positively that the recent change "from a high to a low level in prices is due to any "change in money"—the fact being that he had said exactly the reverse. I noticed it at the time, because I remembered the passage, and I looked it up, and I found that in the "Times" report the word "not" had been somehow or other inserted, which entirely upset Mr. Goschen's argument. Perhaps I might make one more quotation from Mr. Giffen, if he will excuse my quoting him in this way — that is, that Mr. Giffen went a little further in one of these essays in 1879. He says: "The moral of much that has been said is "clearly this, that if possible the scarcity of gold "which has contributed to the present fall of prices, "and may have further serious effects in future, "should, if it be possible, be mitigated, and should at "any rate not be aggravated by legislative action."

23,651. (*Mr. Giffen.*) That was in 1879, was it not?—That was in a paper on the fall of prices.

23,652. In 1879?—Yes.

23,653. Before a large part of the fall had taken place?—Yes, and before some of these measures of demonetisation, certainly.

23,654. (*Mr. Chaplin.*) Have you any others that you would like to bring before us?—There is just that remark of Mr. Goschen's which has always struck me. He said, I think, at Manchester—I could find the reference,—"The case seems to me to lie in a nutshell..... "You have the decreased production of gold; you "have the increased production of commodities; and "you have the fall in prices which these two factors "ought to produce. It ought to have produced it, and "the fall is there; but, somehow or other, there are "many persons who are furiously angry if people "contend that there is any relation between the cause "and the effect." That represented his view at that time; that the matter was quite clear; that the cause was a monetary contraction. It was in an address to the Manchester Chamber of Commerce in June 1885.

23,655. Have you any other authorities you would like to refer to?—I think I would like to remark that Mr. Giffen observed that this fall of prices might be long continued. He says in December 1888, quoting, I think, a passage written in 1883, if I rightly understand my notes, "We may have a long continued fall "of prices from generation to generation, and this will "probably have very great effects as time goes on. "We may perhaps have what may be called a perma-"nent transition period as far as I can see."

23,656. (*Mr Giffen.*) That is "might have"?—Might have, then.

23,657. A doubtful opinion?—Yes.

Prof. H. S. Foxwell.
14 June 1894.

23,658. And subject to what was going on in the Transvaal, I think?—I do not quote it for much more than this, that I think you pointed out that this is no ordinary periodic or cyclic movement, but might be a continued movement in the same direction unless the causes at work were modified. "All the evidence," Mr. Giffen said at that time, "seems to me to point to "a continuance of of the appreciation. . . . All "these facts point to a continued pressure upon gold." With that view I should entirely concur. I would even say that it seems to me now, looking at the question from the point of view of present facts, that I see no reason to expect, unless there is a change by legislation in the attitude towards silver, that we shall have any considerable recovery of prices; there might be a temporary recovery but nothing permanent.

23,659. (*Mr. Chaplin.*) You mean to say that the opinions you have been quoting from Mr. Giffen's writings some years ago have been born out thoroughly up to now by the results?—Yes.

23,660. And you anticipate no change in the future, but rather that the fall will continue?—There has been a certain change in the circumstances, especially as regards the production of gold, but that change has not seemed to me sufficiently important to neutralise the general effect of the demonetisation and disuse of silver.

23,661. Have you any other authorities that you wish to cite in support of the view that gold has appreciated?—I do not know exactly where to begin with the authorities. I do not think there is very much to be gained by citing them. As far as I know, all the economists practically agree about that. I have a number of names on one of my papers.

23,662. (*Mr. Giffen.*) Not Mr. William Fowler?—No, I was thinking of theoretic or professional economists rather.

23,663. (*Mr. Chaplin.*) It is the fact, I think, that Lord Iddlesleigh's Commission on the Depression in Trade and Agriculture in its majority report expressed a strong opinion as to that?—Yes, I think I have a reference to that.

23,664. (*Mr. Everett.*) It was in an interim report, was it not? They paused in their work and made a special report on that subject?—I have just noted here that that view was accepted by Professor Jevons, by Dr. Soetbeer, a monometallist and perhaps the author of demonetisation as much as that can be referred to one man, by Lord Beaconsfield, by Mr. Balfour, by Mr. Goschen, by all the British economists, so far as I know, and by the Indian Government. These authorities accept the fact of the appreciation of gold, and they go further, all of them, and attribute it distinctly to the demonetisation of silver—even Dr. Soetbeer.

23,665. (*Mr. Chaplin.*) I suppose we may take it, then, to be your opinion that the effect of the appreciation of gold has been clearly established almost beyond dispute?—Yes, that is undoubtedly my opinion.

Views of French economists on bi-metallism.

23,666. (*Mr. Giffen.*) Can you tell us anything of the opinion of French economists?—I have never taken a very great interest in the writings of what may be called the official school of French economy. They seem to me very high and dry; we derive no ideas from them. The science has derived no movement in any way from them. The most active school now in France is the school of Montpellier, and the head of that school, Professor Gide, has accepted the general view of those who are called bi-metallists. As to the official school in Paris, it is, I think, pretty well known that they are inclined to monometallism almost without exception, but I am not aware that they deny these facts of which we are now speaking.

23,667. Has M. Leroy-Beaulieu expressed no opinion?—I do not know of an opinion that he has expressed against the views above stated as to the fact and cause of the fall of prices. He is not in favour of bimetallism; I am aware of that. But I ought to point out that M. Leroy-Beaulieu accepts the view, that the quantity of money is of the greatest possible importance, because, he observes, as Mr. Goschen pointed out in one of the monetary conferences, that the discovery of the precious metals may have been said to have saved France from bankruptcy in the year 1850. That was attaching a very marked importance to the advantage of a rise in prices.

Prof. H. S. Foxwell.

14 June 1894.

Supply of gold from Africa.

23,668. (*Mr. Chaplin.*) Then I think you said that this process of appreciation had hitherto been progressive, and that you expected it still to continue?—I do upon the whole. I think that although we are receiving larger supplies of gold from Africa, there is no reason to apprehend any very considerable supply from Africa. I have consulted on that point the best geological opinion I could find in this country—the opinion of those who are specially petrologists, and interested in rocks and minerals. They hold the view that there is no reason to expect an excessive supply; in fact, it was put to me by Mr. Teall, who is one of the most distinguished of English petrologists, if not the most distinguished, that in regard to the precious metals, it was rather a question, no doubt, of metallurgy than of discovery, whether their quantity was likely to be increased; but that upon the whole there was no reason to apprehend an excessive supply in regard to either metal—either gold or silver; in his opinion the danger and the probability were in the other direction. It is well known that the most eminent Austrian geologist, Suess, is very strongly of that opinion. I have several quotations from him here, in which he says that practically gold mono-metallism is absolutely impossible for the world as a whole.

23,669. (*Mr. Giffen.*) Was Suess acquainted with the condition of things in the Transvaal when he wrote his book first of all?—I have his later book here, written in 1893, and there he goes most minutely into all the conditions of mining in the Transvaal. The other day I consulted the best general geologist I know, as to the reputation of Suess, and I was told that not only was he a specialist upon the mining of the precious metals, but that he was a man of marked intellectual power, who stood head and shoulders above most European geologists. This came to me from a gentleman who knows nothing of the monetary question, and who was judging Suess merely on his geological reputation.

23,670. (*Mr. Chaplin.*) Then I may take it that you see no reasonable prospect at present of gold being discovered in sufficient quantities to have the effect of arresting this process of appreciation?—I do not like to express an opinion upon that point, for really my opinion is worth nothing; it is entirely second-hand; but so far as I have been able to obtain information bearing upon the point, it certainly is the conclusion I have formed.

23,671. Is this not the case: that the important point in connexion with this question is not the amount of the annual output, but the existing mass?—Certainly.

Production of gold since the XVth century.

23,672. Can you tell us at all what the production of gold since the 15th century was estimated at, in the report of the Gold and Silver Commission?—I do not happen to have that figure with me, I think, but I have the figures of the annual production from 1850. It would certainly, I should think, be 20 times the annual production—something in that proportion.

23,673. I will ask you this question: whether you are aware that in section 44 of the first part of the final report of the Gold and Silver Commission it is stated as follows: "Dr. Soetbeer's estimate of the production of gold since the end of the 15th century is 1,553,415,000*l.*"; you are not acquainted with that?—1,500,000,000*l.* millions of gold alone?

23,674. Of gold alone; of the production of gold since the end of the 15th century?—No, I was not prepared to find it quite so large as that.

23,675. Do you know what the annual output at the present moment is?—I have not the annual output for 1893. It will be higher; but in 1892 the output of gold was 26 millions. I believe it is now over 30 millions.

23,676. Even taking it at 30 millions, or more than 30 millions, I apprehend then that if Dr. Soetbeer's estimate is anything like correct, the addition of 30 millions to the existing mass is merely a fractional addition?—Yes.

23,677. And would not have any great effect upon prices one way or the other?—I should like to mention too, that we must expect an increased demand for the use of gold in the arts as the world grows richer, for watch cases and purposes of that kind, which, in the opinion of many persons who have given attention to the subject, will, in itself, soon be sufficient to require the whole annual production. I know that is the opinion of one gentleman for whose opinion I have a great regard in these matters.

23,678. If you are right in your view, then we must look forward to a period of a still further fall in prices?—Yes, on the whole I should expect that.

Prof. H. S. Foxwell.

14 June 1894.

Probable further fall in prices.

23,679. (*Mr. Giffen.*) And an immediate fall of prices would you say? What is going to happen in the next five years?—I am never anxious to prophecy. I should avoid prediction in general, but if I were going to predict I should always object to predict what might happen in a specified year, because we might have one of these market movements, or one of these speculative movements intervening which would entirely upset the general effect of the currency change, but I should say that the general movement in the next 30 years would on the whole probably be downwards. It is always subject to some astonishing discovery of gold which might take place, but which I do not know that there is any particular reason to suppose will take place. My chief reason for qualifying that expression of opinion would be that a very large amount of capital has been sunk in the Transvaal—in the South African fields—by persons who are usually prudent in their investments and who presumably would not have sunk that very large amount of capital unless they had reason to anticipate some return for it. That, I admit, rather goes against the view I have expressed, but still I adhere to that opinion.

23,680. (*Mr. Chaplin.*) Then we must rather be prepared for a further fall in prices?—Yes. I should like to say this too—that the demonetisation of silver is not quite complete, we are not at the end of it, but if nothing is done to reinstate silver as a monetary metal, I apprehend that the demonetisation will be carried out to the bitter end. The introduction of a gold standard in India, for example, would bring about a fall of colossal magnitude. I would also say, and I would set this against a possible increased production of gold from the South African field, that we have a certain diminution of legal tender money in the cessation of coinage under the Sherman Act, which is very considerable. The void caused by that cessation must be filled by gold, and if you take that into account together with the probable increased demand for the arts, I think we may fairly set that off against that probable increased yield from the South African fields.

23,681. (*Mr. Everett.*) By how much would you consider gold has risen now, as compared with 20 years ago?—The exact amount in fact of the fall? I should say that prices have fallen rather more than 33 per cent.—I take that as a round number—not from 1873; the fall is much greater from 1873; but from the average of the 25 years before 1877. If we translate that into its equivalent terms it amounts to this, that gold has appreciated 50 per cent. in those 20 years. In other words, if we say that prices have fallen 33 per cent. it is the same thing as saying that gold has appreciated 50 per cent. I put it this way: You want 66 sovereigns now to buy what 100 sovereigns would have bought, that is two to buy what three would have been required to purchase in 1873; therefore each of those two sovereigns now is worth 1½ times as much as a sovereign was worth in 1873, therefore the value has appreciated 50 per cent. That was a point that I missed myself, I must admit, in writing on the subject two years ago, but I think it is quite clear that that is so.

23,682. (*Mr. Chaplin.*) Then if you are right in your view and if nearly all the witnesses who have given evidence before us are right that the chief cause of agricultural depression is the fall in prices, it follows I think that agriculture is suffering now severely from one of the results of the monetary changes, namely the appreciation of gold?—That is very distinctly my opinion.

Effect on agriculture of divergence in ratio of gold and silver.

23,683. But that is not the only result; you referred to another; you said there was a second result which also affected the agricultural position, namely the divergence which has arisen between the two metals in consequence of the appreciation of gold?—Yes.

23,684. Is agriculture especially affected in any particular way by that divergence?—I think so.

23,685. Is it this divergence, which in your opinion explains the fact that certain countries like India appear to be able to send wheat here at a profit even at the present low price of 19*s.* and 20*s.* a quarter?—Yes, I should certainly say so.

23,686. Will you try to explain that to the Commission?—It appears to me that certain countries using a silver currency have not been subject to the fall of

Prof. H. S. Foxwell
14 June 1894.

prices. The cost in those countries of raising wheat is pretty much the same to-day as it was in 1873 so far as the monetary question is concerned; it is really rather less because of the reduction in freights and the development of railways in India and other causes of that kind. At all events I am safe in saying that they can easily afford to raise their wheat to-day for as much silver—not more at all events—than the silver which it cost them in 1873. That being the case, their wheat could be put in Mark Lane at the same silver price that it was put at in Mark Lane in 1873—at a lower silver price as a matter of fact, but that is still more in favour of my argument. Now, at the present ratio of exchange between silver and gold, the same amount of silver is only worth half as much gold as it was worth in 1873. Hence, as the cost of raising wheat in India, measured in silver, has not increased since 1873, it is evident that the Indian farmer can afford to sell his wheat in 1893 at half the gold price he could accept in 1873. Perhaps I had better put the matter in rupees which makes it a little clearer.

Effect of fall in gold value of rupee on Indian wheat grower.

23,687. Yes, if you will kindly do so?—You were good enough to submit to me some evidence of Messrs. Ralli, laid before this Commission; from this evidence it appears that in 1892 the low sterling price of wheat left the Indian farmers as much profit as it did in 1873, when the sterling price was 100 per cent. higher.

23,688. (*Mr. Giffen.*) That evidence was given before Lord Herschell's committee, was it not—I should like to have the reference exactly?—I think I found it in one of the answers given by one of the witnesses before this Commission. [*See* Q. 4771, &c.]

23,689. (*Mr. Lambert.*) By the low sterling price you mean low gold price?—Yes, that was evidence that the Indian farmer can raise his wheat just as easily at a gold price to-day, which is one half the gold price of 1873. It stands to reason that the English farmer is not able to do that. The adjustments to which reference has been made have not taken place to such an extent that he is able to raise his wheat to the same profit at a price of 24*s.* as at the old price of 56*s.*, or 50*s.*

23,690. (*Mr. Chaplin.*) May I put it to you in this way: Is it not the fact that when the price of wheat was 2*l.* a quarter and the rupee was worth 2*s.*, the Indian grower of wheat at that time got 20 rupees for his quarter, because 20 rupees at that time exchanged for 2*l.*?—Yes.

23,691. Now the price of wheat has dropped to 1*l.* a quarter in England, but the Indian grower still gets 20 rupees, because the rupee has fallen to 1*s.*?—Yes.

23,692. And at that rate the 1*l.* per quarter which he gets for his wheat will exchange for as much as 2*l.* did before?—Yes. I put it in this way, that the Indian grower consequently has a relative advantage. The expression "bounty" which has been used very often in connexion with this has been objected to by some persons, and is not strictly accurate; but it is perfectly clear that there is a relative advantage on the side of the Indian grower, brought about by the price movement.

23,693. The advantage being this, I understand you, that although the price has fallen 50 per cent. in England, the Indian grower is still getting the same number of rupees that he got before?—Yes.

23,694. Will you go a little bit further and answer this question: Is it not the fact that in India up till quite recently, if not up till the present date, the purchasing power of the rupee in India has not fallen at all?—Not appreciably. I think there is a certain discrepancy in the evidence given, but I think we have no distinct evidence that the value of the rupee had fallen appreciably down to the end of the year 1892.

23,695. Are you aware that the 12 members of the Gold and Silver Commission were unanimously of opinion and put their names to a paragraph to the effect that the purchasing power of the rupee up to the time when that Commission concluded its labours had not altered?—Yes, I was aware of that and I agreed with that. It seemed to me that on the whole the purchasing power was a little higher, if anything, at that time.

23,696. Then the position of the Indian grower of wheat, I understand, owing to the divergence of the metals, is this, that he is able to place his wheat—his produce—upon the English market at the present price although that is 50 per cent. less than it was 20 years ago, without any loss to himself?—Yes.

Prof. H. S. Foxwell.
14 June 1894.

23,697. His position remains exactly the same?—Yes.

23,698. And owing to that fact he is able to depress the market price of wheat in other parts of the world?—I am unable to resist that conclusion. I know that it is disputed, but on grounds that I have never been able to follow.

23,699. That is your deliberate opinion?—That is distinctly my opinion.

23,700. Of the position as between the English and the Indian grower of wheat?—Yes.

Effect of appreciation of gold on British wheat grower.

23,701. (*Mr. Lambert.*) Then if gold has appreciated 50 per cent., the British grower of wheat ought to get the benefit of that?—If the adjustments consequent upon the appreciation of gold had been thoroughly carried out to the bitter end, if everything had fallen in England in exactly equal proportions, including all mortgages, all liabilities, all rates and taxes, all railway fares——

23,702. (*Mr. Everett.*) All official salaries?—Quite so.

23,703. (*Mr. Giffen.*) But not the cost of labour?—Yes, I should say the cost of labour too, though wages, owing to the introduction of machinery and other improvements in agriculture, need not have fallen in the same degree as the cost of labour, but I should like to go into that more fully in a separate way; I mean as regards the position of labour I think that is so very important that it almost requires to be discussed separately. In continuation I have only to say this, that these adjustments have not been made; that rates and taxes have not diminished proportionately in their gold value, that mortgages have not been written down necessarily—some may and some may not—that rents may not in all cases have been completely adjusted, in spite of the great reductions, and that in regard to all the investments of capital in the land of course they stand to receive a certain fixed rate of interest, and that has not been written down. Possibly, when all these adjustments have been made the English grower might find himself in the same position; but it is the process of making these adjustments which is the disaster which we wish to avoid.

23,704. (*Mr. Chaplin.*) And it must affect all those who have invested their capital, I understand, in any industrial undertaking?—Certainly; the case of a farmer is not peculiar except in the length of the period of his engagements.

23,705. (*Mr. Lambert.*) But that would somewhat tend to prove that if the adjustments were properly made there would be no need to complain of the monetary causes?—There I ought, perhaps, to draw the distinction, that if prices were to stop where they are now we should get accustomed to that position of prices in this generation, and the next generation would start afresh upon a perfectly independent footing, upon as favourable terms as during the time of high prices, I thoroughly and entirely agree. But if we are to look forward to a continuous fall, this disturbance to which I have referred, and which is practically a tax upon the productive industry of the country, will be continuing year by year.

Fall in prices due to appreciation of gold and divergence in ratio of gold and silver.

23,706. (*Mr. Chaplin.*) Then may I take it that this is your conclusion as far as the question of prices is concerned due to these monetary changes—that we are suffering agriculturally from two things, first from the appreciation of gold, which means a general fall in prices; and secondly from the divergence in the value of the metals, which means an additional and further fall in the case of articles which are the subject of competition in silver-using countries?—Yes. Might I first mention a passage which I have extracted from one of the leading papers bearing upon this bounty or advantage to the grower in countries where the currency has not appreciated. I merely mention it as showing that the view which I have adopted myself is one which prevails in commercial circles. It is a statement in relation to the condition of the wheat market. It refers to the supplies from the Argentine Republic, which is, of course, not a silver country, but a country with a currency which certainly is not appreciating—it is moving in a very remarkable way but, generally speaking, in the direction of depreciation, prices, that is to say, are not falling there, but on the whole rising in the local currency. The statement is this:—"After "a slight rally at the beginning of last week the

Prof. H. S. Foxwell. 14 June 1894.

"wheat market settled down into a deplorable state of "collapse once more, one alleged reason being the "advance of the gold premium in the Argentine "Republic to 316 per cent., or 44 per cent. higher than "it was a month before. The rise, according to Beer-"bohm, is equivalent to about 1*s.* 6*d.* a quarter in "favour of the Argentine shipper, which just covers "the decline in the price during the period. Argentine "wheat has been sold here at 20*s.* a quarter off coast. "and one cargo, it is said, as low as 19*s.*, a price never "touched before." That shows that the view is taken amongst business men that this variation between the movement of the currencies does affect the price of wheat.

23,707. (*Mr. Giffen.*) At the moment of transaction—at the moment of change?—Yes, but it is not exactly a moment; it is, as you say, a whole period of transition, a normal condition of transition. We have been engaged in the process ever since 1873.

Remonetisation of silver.

23,708. (*Mr. Chaplin.*) The result of the monetary changes having, in your opinion, been so injurious to agriculture, is it your view that the re-monetisation of silver would benefit the farming interest?—Yes, the conclusion seems to me inevitable.

Effect on silver.

23,709. (*Mr. Lambert.*) Will you allow me to ask the distinction. Do you take the agricultural interest or the tenant farmer pure and simple?—I had in view rather all the classes connected with agriculture as a whole, but no doubt, in theory, it would concern more directly and more immediately the employer, the farmer, the man who sets industry in motion. It would apply to the producer in all industries, and especially, I think, to the producer in agriculture. It applies mainly, no doubt, to the farmer.

23,710. (*Mr. Chaplin.*) Are you of opinion that it would have the effect of arresting this progressive and continuous fall in prices?—I think it would have some effect in that direction. Whether it would be sufficient altogether to maintain prices stable or not is a more difficult question, but it would certainly lessen the tendency to a fall. There can be no question whatever about that. My own impression is that it would give us a slight rise of prices.

23,711. Whatever the tendency to fall may be at present, and whatever the evil may be or the consequences of that progressive tendency to fall, the remonetisation of silver would at all events minimise it and lessen it?—Certainly, and the degree to which it would lessen it would depend very much upon the ratio selected—that is the value assigned to silver in terms of gold.

23,712. You are of opinion then that if there was a change it would probably be rather in the direction of a rise than of a further fall?—I should expect that, not only on account of the substantial effect of the remonetisation, but also on account of the moral effect in giving tone to business and causing a revival of business, which in itself would bring about inevitably a rise in prices. Anything which would relieve the present stagnation must inevitably bring about a rise to some extent.

23,713. If that view which you have just put before us is correct then it would have the effect of getting rid of what has been so repeatedly placed before us as the chief cause of agricultural depression, namely, the progressive fall in prices?—It would certainly lessen that effect. I ought, perhaps, to say that the fall of prices in agriculture is not only due to the currency disturbance. It is also partly due, of course, to certain circumstances that I have mentioned in the brief that I have put in relating to the competition of other countries which have recently been opened up.

Effect on agriculture of grants of free lots.

23,714. Would you like to say anything upon those points?—There is one of those circumstances I think rather important, and that is the artificial stimulus which has been given to farming by the grants of free lands in different countries. I do not know how long that is to continue. There will probably be some considerable check in that taking up of new lands, if only on account of the limitation of the land to be taken up. But I imagine that that offer of an independent means of living, which must necessarily be an agricultural means, has undoubtedly drawn many persons into farming who might have otherwise taken up other occupations. It is a substantial offer of a piece of property which they can only get in that particular way. That would have a tendency to diminish prices in England.

23,715. (*Mr. Giffen.*) But you cannot specify any countries at present where that is in operation to any extent?—I am not fully aware of the extent, but I should suppose it was going on in the western part of Canada, and to some extent in the Western States.

Prof. H. S Foxwell 14 June 1894.

23,716. I believe not in the United States now?—I remember a scramble for taking up a new territory some time ago, which was described in the papers.

23,717. (*Mr. Chaplin.*) That is one cause which, in your opinion, may also to a certain extent have affected the agricultural situation?—Yes.

Cheapening of freights and increased transport facilities.

23,718. What have you to say upon the question of the cheapening of freights, and the greater facilities of transport?—Undoubtedly that would have an effect in the same way, but it is evidently inadequate to account for the general agricultural depression prevailing in the world, because it ought to have improved the condition of the countries that send us wheat, whereas in America there have been complaints almost as loud as the complaints in England as to the depression of the farming interest. America should have profited by the cheapening of freights exactly as we no doubt have been injured.

23,719. So that the cheapening of freights would not be sufficient in itself to account for it?—No.

Agricultural depression confined to gold standard countries.

23,720. (*Mr. Everett.*) When you spoke of the general depression of agriculture through the world should you not have said with the exception of the Argentine Republic, and of the silver standard countries?—Yes, I should have said so certainly.

23,721. There is no agricultural depression there?—No; I meant, of course, simply in those countries whose currencies have been subject to the general fall of prices.

23,722. The gold standard countries?—The gold standard countries.

Remonetisation of silver.

23,723. (*Mr. Chaplin.*) Now, with regard to the remonetisation of silver I understand that you would be prepared to advocate that as one means and a very important means of remedying the agricultural depression?—Yes.

23,724. You are aware that there are people who contend, when you speak of a ratio, that the relative value cannot be maintained between the metals by law?—Yes.

23,725. You have put before us up to now that, in your opinion, the monetary changes that you have referred to have been very greatly the cause of agricultural depression, and you have given us your reasons for thinking so; have you any remedy to suggest or to propose?—The remedy would be naturally to return as soon as was practicable to the remonetisation of silver, that is to say, to the use of silver by international agreement as legal tender money at a fixed ratio to the mintage price of gold.

23,726. And you believe that to be a practicable proposal?—I have no doubt that it would be practicable if it were adopted upon a sufficiently wide basis. When I say practicable I mean that it would be comparatively permanent if adopted upon a sufficiently wide basis.

23,727. You are aware that some people still contend that it cannot be done?—Yes.

23,728. Is it not a fact that the members of the Gold and Silver Commission who examined into this question for something like three years unanimously reported that it could be done?—Yes, it was so, with, I think, a slight reservation on the part of two members.

23,729. (*Mr. Lambert.*) Who were those two?—Sir John Lubbock and Mr. Birch.

23,730. (*Mr. Chaplin.*) That reservation being what?—That they had some doubts as to whether the effect would be permanent. Their general statement was in these terms:—"We think that in any conditions fairly "to be contemplated in the future, so far as we can "forecast them from the experience of the past, a "stable ratio might be maintained if the nations we "have alluded to"—they were the United Kingdom, Germany, the United States, and the Latin Union,—"were to accept and strictly adhere to bimetallism at "the suggested ratio."

23,731. (*Mr. Giffen.*) What ratio was that?—It was a ratio, I believe, not very different from the market value.

23,732. The market ratio at the time?—The market ratio, I suppose, at that time—I do not know whether it means at the time when bimetallism was adopted.

Prof. H. S. Foxwell.
14 June 1894.

23,733. (*Mr. Chaplin.*) I think it means any ratio that was suggested?—I think the reference is here: "It appears to us that it should only be on the basis "of a ratio between silver and gold approximating to "the present market ratio of the two metals. It would "not, of course, be practicable for obvious reasons to "adopt as the basis of the arrangement what happened "to be the market ratio at the date fixed for its coming "into operation. It would probably be thought "desirable to take the average ratio of two or three "years." I should wish to offer an opinion upon that question if it is to be discussed.

23,734. I do not think we will enter upon that?—Dissent appears to have been expressed from that report, generally including, I suppose, that clause, by Sir John Lubbock and Mr. Birch. I think the important passage is this: "We feel also grave doubt as to section "107 of the foregoing report." That is the one I have quoted. Then some statements are made in regard to the cessation of coinage by the Latin Union, and then this sentence occurs: "No doubt the adhesion of "England, Germany, and the United States would be "a very important addition of strength, and we do "not deny that such a combination might for a considerable time be able to maintain the ratio adopted. "Having regard, however, to the great uncertainty as "to the probable future production of the mines, the "large use of the precious metals in the arts, and to "the number of countries which would still remain "outside the combination we doubt whether any given "ratio could be permanently maintained." It seems to be rather a question of time.

23,735. (*Mr. Everett.*) That is the opinion of the dissentient two?—Yes, and then Sir Thomas Farrer has a slight note: "I wish to add, for the sake—not of "dissent, but of distinctness, that I do not believe that "the change in the relations between gold and silver "currencies has lowered English prices"—that is another matter.

23,736. (*Mr. Chaplin.*) Subject to those explanations all the members of the Commission unanimously signed the paragraph expressing the opinion that a ratio can be maintained?—Yes.

23,737. (*Mr. Lambert.*) How many members were there?—There were 12, and there were two reports, each signed by six members, but the 12 members agreed upon signing certain other portions of the report.

23,738. (*Mr. Chaplin.*) I believe it is the case that they expressed very different opinions as to the expediency of adopting that proposal?—Yes.

23,739. But they all came to the conclusion that it was practicable?—That is how I read the report.

23,740. (*Mr. Giffen.*) They did not explain in detail in what sense it was practicable?—As to the period of time for which it would be practicable?

23,741. No; of the kind of practicability it would have; what would happen under it?—I am not aware that that was expressed in detail, but I think the inference may be fairly drawn that they thought it would relieve the fall of prices, because that was the point which was submitted to them for consideration.

23,742. (*Mr. Chaplin.*) Is it not the case that the point submitted to them and to which that decision referred was this: whether it was possible by international agreement to maintain a stable ratio between the metals?—I do not know whether that was in the original reference to the Commissioners.

23,743. Is that not the point to which the paragraph you have quoted referred?—That is undoubtedly the point to which the paragraph referred.

23,744. (*Mr. Lambert.*) Did they differ as to the method of bringing this object into force?—No, I am not aware that there was any difference at all; I do not think that the question of method was very closely considered—it was spoken of as free coinage, and so forth.

23,745. (*Mr. Giffen.*) Was it considered at all?—I do not know that I go quite so far as that, but it might have been considered further undoubtedly.

23,746. (*Mr. Chaplin.*) The general result of the report of those 12 gentlemen who were appointed to sit upon this question and to examine into it was this, that subject to the qualifications you have mentioned, on the part of two of them they all expressed the opinion unanimously that it was practicable by legislation and international agreement to maintain a stable relation of value between the two metals?—Certainly.

Prof. H. S. Foxwell.
14 June 1894.

23,747. Independently of arguments or the opinions by which they arrived at that conclusion?—That is so.

23,748. (*Mr. Lambert.*) Did they arrive at that conclusion by different arguments and different opinions?—I do not think there is any indication of that.

Free mintage of gold and silver

23,749. (*Mr. Chaplin.*) Putting aside the question of past experience, by which I mean the fact that for a great number of years during which a stable ratio was practically maintained, putting that aside, will you state your own reasons for believing that it could be done?—That would naturally include the explanation of the system by which we propose to effect it. What would be proposed would be the free admission—the free purchase perhaps I should rather put it—of either gold or silver bullion in unlimited quantities by the mints of the contracting countries, or by banks acting as agents for the mints, paying in return legal tender money, presumably I think of the nature of paper money.

23,750. (*Mr. Giffen.*) Not in the same metal that they give?—No.

23,751. You have a different idea?—I am not speaking of the question of free coinage particularly; I am rather speaking of what Mr. Dana Horton has called the free purchase of bullion, and I think we might perhaps, by a slight extension of the ordinary meaning of the word, call it "free mintage." The essence of the operation as I understand it is this, that in return for quantities of bullion of either metal the person tendering the bullion receives legal tender—not necessarily coin, that would be a pure matter of convenience and a question of small change. He might perhaps obtain coin by application at the bank if he required small change; but in general I take it the operation would be one of the purchase of bars either of gold or of silver bullion. The proposal was made in almost identical terms by Mr. Alexander Baring in 1819, when we were about to resume cash payments.

23,752. What would the paper say—what would be the promise to pay on the paper?—The promise to pay would be in gold or silver bars at the option of the Bank or Mint—the Government agency—which would be the Treasury probably in the United States, and in England the Bank of England.

Effect of free mintage of gold and silver.

23,753. (*Mr. Chaplin.*) Then will you state what the effect of that would be in maintaining the relative value between the two?—The effect it seems to me would be this, that neither metal could in the outside general markets fall below the price which would be thus offered for it freely at the mints in indefinite quantities. It is not easy to see how any owner of silver would ever sell it for any other purpose, in the arts or otherwise, for less than the price which he could obtain at the mints in legal tender money, money which would discharge all debts and serve all the ordinary purposes of money. The effect would be brought about in this way: if we suppose, for example, that gold became extremely plentiful owing to the South African discoveries, and that there was any tendency to lower the value of gold in the outside markets as compared with silver, that tendency would inevitably be checked by the fact that there was a permanent market as it were for gold open at the mints of the agreeing nations who stood bound to buy unlimited quantities of that gold at a fixed price. Therefore, I take it that the price of gold in the legal tender currencies of the contracting countries could never fall below the mint price.

23,754. (*Mr. Giffen.*) You speak of it as a purchase?—Yes; an exchange perhaps—well, a purchase, because the bullion would remain in the possession of the governments in exchange for which the legal tender money would remain in possession of the persons tendering the bullion.

23,755. (*Mr. Chaplin.*) Either metal under those circumstances, if I understand you, would be legal tender for the discharge of debts?—Yes.

23,756. Then if either metal were to fall below its legal tender—to use that term—there would be an immediate demand upon it, I suppose, by debtors for the purpose of paying their debts?—I do not like to put it myself as a question between debtors and creditors, because it would wholly be a question with bullion merchants. The debtor would pay exactly as he pays to-day by cheques and notes or instruments of that

Prof. H. S. Foxwell.

14 June 1894.

kind, which are based upon reserves in the banks, but the debtor would never consider what his note or cheque was based upon, whether upon silver or upon gold, any more than he does in France at the present day. If he draws a draft on the Bank of France he does not know whether that draft stands against silver or gold. It is not a question so much of the debtor selecting the metal, but it is rather a question of the bullion merchant dealing in bullion who would take his metal at once to the Mint whenever the difference between the Mint price and the market price offered him a sufficient inducement to move the metal to the Mint. That is the way in which I prefer to put it.

Influence of French bimetallic mints on stability of the rates.

23,757. Then your view as to the practicability of maintaining the stable relation between the metals by these proposals is borne out, is it not, by the actual experience of the past; is it not the case that during the years prior to 1873 there were very much greater variations in the production of the two metals than there ever have been since that time?—The history of the matter appears to me most remarkable in that respect, as showing a power which we could hardly have presumed beforehand, if we consider that there was only one country at that time effectively bimetallic, and offering this indefinite power of purchase to the holder of either metal.

23,758. That country being France?—That country being practically France. I think the steadiness of the ratio is very remarkable. I should like to call attention to the fact that when the contrary is sometimes stated (any variation whatever could only be alleged within very narrow limits) even the variations thus alleged are not variations, of course, of the prices in Paris adjacent to the bimetallic mints, but they are variations in the London price of silver or the Hamburg price. Those prices we quote are generally London prices.

23,759. (*Mr. Giffen.*) Is that so?—Yes, I think so; Pixley and Abell's prices are so.

23,760. To the best of my belief I gave a lot of quotations of the prices of gold in Paris a good many years ago?—I should like to see those prices.

23,761. The premium on gold, which you will find in my book on bimetallism, was the premium on gold in Paris, the figures being those which were given to the Bankers' Institute?—May I ask where the quotation was found for the premium on gold?

23,762. It was found in blue books, it was taken from contributions by the Bank of England to former bullion committees?—I am sorry to say that I have not noticed that myself, but it does not affect the validity of the argument which I propose to offer to the Commission. I think that if you take the London prices as your basis for the market price of gold and silver, as has generally been the case, and as Pixley and Abell's prices have been taken from 1833 at all events, then Mr. Hucks Gibbs has shown, in my opinion, quite conclusively that those London prices did not differ from the prices at the Paris Mint, more than was sufficient to cover the expense of moving silver from London to the Paris Mint, taking account of the then state of exchange.

23,763. But that argument would not apply to prices which I gave, which were the Paris prices?—No, but I am not prepared to go into that now. It does show, however, this, that the London prices never varied from the Paris Mint price, more than the cost of carriage to the French Mint. London prices are very important from the point of view of silver. I should think there might be some circumstances explaining the discrepancy, if there is a discrepancy, between the Paris market price and the Paris Mint price.

23,764. You have not investigated the matter to see what the Paris prices were?—I have not, but we know the seigniorage was changed very frequently at the Paris Mint,

23,765. Were not the Paris prices much quoted?—I do not know exactly what you mean by the Paris prices being much quoted, because the London prices are the prices which appear in Soetbeer's list, and which are also accepted by the American Government, and which were put before our own Commission; I think they have not been very much quoted, at all events.

23,766. I am referring to the other prices which it seems to have been convenient to have overlooked?—Not at all, they have not been intentionally overlooked. I should be very glad to see them. The witness subsequently wrote—"I had misunderstood the "line of examination. I had seen the quotation of agio "on gold in Paris. But these do not give a market "value of one metal in terms of the other, but of each "as bullion in terms of currency. *Both* metals were "at an agio over almost the whole period, 1821–72 "inclusive."

Prof. H. S. Foxwell.

14 June 1894.

23,767. (*Mr. Chaplin.*) London prices are usually quoted, are they not, for everything?—I understand they are as a rule. I wish it to be clearly understood, that what I have said is, that the metals in the market do not sell below the Mint price. I have not said that there might not be an agio on the metals either one or both, and very likely that may explain some of the differences.

23,768. (*Mr. Giffen.*) Surely if there was an agio on one, then that does alter the mint price?—No.

23,769. As regards the two metals?—It alters the market ratio, but it does not alter the mint price.

23,770. That is to say, the mint will only take them at the ratio?—Yes.

23,771. But the ratio between the two metals is different from the price of the mint?—I admit that fully, but at the same time the price can never fall below what the mint is willing to give, that is quite clear.

23,772. The price is below according to the statement of the market price?—Pardon me, I am afraid I do not follow that argument. You get legal tender money, which is the standard of price, from the mint at a certain rate, and you can never get less than that.

23,773. (*Mr. Chaplin*) Your contention is, that the price obtained for the metals at the mint does not vary?—That is so; and that the market price does not vary by more than the cost of the carriage to the mints below that price, but above that price it may vary for this reason which I wish to point out—that under a system of bimetallism, such as has hitherto existed (and it would probably be the same in future), the mint or the bank acting as a debtor, of course, exercises its right of option, and pays in whatever metal it pleases. Further, it has usually in the past paid in coin, though I think in the future it will probably pay in bar. The consequence of that is, that those who wish bars for export, and who wish to make their option of the particular metal for export, say, gold for England, or silver for India, would have to pay for the right of choice which was not open to them under the system. They would have, in fact, to pay an agio, or a slight premium in that way. It would not be a very considerable sum; but the curious fact is, that that agio has existed on both metals at the same time. It was so in 1856, and it was so, I believe, in 1873—I have the details here; and, therefore, it must not be taken that the mere fact of an agio on one of the metals necessarily upsets the ratio between them.

23,774. (*Mr. Giffen.*) Have you looked minutely into the question?—I have read what Newmarch says about it in 1856.

23,775. I am sorry to say that the difficulty of stating what is the real premium on gold and silver respectively in France is simply enormous?—That is why I asked you where you got the quotation; it seemed to me that it would naturally be a very difficult thing to find out. It would almost be a matter of private arrangement, in many cases, between the bank and the individual requiring money. I was not aware that it was regularly quoted, but it is certainly stated by Newmarch as having occurred in 1856, that there was at the same time an agio on both metals. If we take the yearly average agios, as given by Mr. Hucks Gibbs, it would appear that on the average both metals were generally at an agio; but I have no details of weekly or daily quotations. I wish to say this too, that it is not altogether a question of mono-metallism or bimetallism, because the agio exists in England under mono-metallism. The mint price of gold in bars at the Bank, acting for the Mint is 3*l.* 17*s.* 9*d.*, but more than once in the last two or three years—I have the exact dates—the actual price of gold bars has been as high as 3*l.* 18*s.* 2*d.*, so that there has been an agio of 5*d.* on the ounce in England with gold mono-metallism. The explanation is simply that the exporter wanted bars, which are convenient for export; the bank was not inclined to facilitate the export of gold, and insisted upon its legal right of giving coin, which is a right under our system, and the exporter consequently was willing to pay 5*d.* on the ounce to get the more convenient article of bars; and that was charged by the Bank.

Prof. H. S. Foxwell.
14 June 1894.

23,776. (*Mr. Chaplin.*) And you argue from that, that the fact of there being an agio, as it is termed, upon either metal at any given time, does not for any practical purpose, invalidate the soundness of your theory, that the practical ratio between the metals can be maintained?—I think it does not; at any rate my view contemplates the possibility of such an agio.

Relative production of gold and silver before and after 1873.

23,777. Is it the fact that the variations in the relative productions of the metals, prior to 1873, were greater than they have been since that period?—They were very remarkable indeed. The production of gold was 5,400,000*l.* sterling in the year 1849, according to the figures I have, and it rose to 36,600,000*l.*, according to those same figures. There is a little difference of opinion about the exact amount of the maximum yield; other estimates make it as low as 30,000,000*l.*

23,778. However, it rose very largely?—Yes.

23,779. By many millions?—Yes. It rose, I think one may safely say, five times in four years. I know nothing else like it in the whole history of money.

23,780. What happened at the same time in the production of silver?—It remained very much the same.

23,781. In spite of this very remarkable increase of gold, and of the fact of the production of silver remaining the same, the ratio practically did not alter?—It altered very slightly, within something like 3 per cent.

23,782. Whereas since 1873, with nothing like the same variation in the production of the metals, it has diverged from 15½ to 1 to 30 to 1?—To 34, I think we may say. In a single year the movement was from 24 to 1, to 34 to 1, within the year 1893.

Production of silver.

23,783. Is there any apprehension if your system was adopted, of the world being flooded with great masses of silver?—That is, of course, a point dependent partly on the future yield of silver, and therefore wholly problematical; but I have taken the best opinion I can obtain from geologists on that point, and the answer is distinctly that there is no danger of our being flooded in that way. I should like to point out that so far from there being any very excessive production of silver of late, as is sometimes alleged, the increase in the production of silver has only been 140 per cent. in the last 20 years, whereas in the case I have just given to you there was an increase of 500 per cent. in the production of gold in the three years. There has been no very extraordinary increase in the production of silver; and I think that this ought to be remembered, that if, in consequence of the remonetisation of silver, prices generally are raised, that so far will be a fall in the value of both metals, gold and silver, and will so far tend to retard the production of both gold and silver, and must be set against the undoubted stimulus to the production of silver which will result from the higher gold price given to silver by the remonetisation.

23,784. I observe that in the final report of the Gold and Silver Commission, Part 1, paragraph 22, it is stated as follows: "The value of the silver produced "in the world from the end of the fifteenth century to "the present time is estimated by Dr. Soetbeer at "upwards of 1,951,000,000*l.*" Were you aware of that statement?—I should not have expected it to be so large, but I am quite willing to accept it as the best possible figure.

Annual production of silver in recent years.

23,785. Do you know what the annual production is now, or what has been the average production, we will say, for the last five years?—I do not think I have it in the form of an average, but I can easily give it to you. Do you wish the coinage value, or the commercial value of silver?

23,786. We will take the coinage value, if you have it, because that is, I suppose, what was estimated in this report?—The coinage value in 1892 was 39·3 millions, getting on towards 40 millions; the commercial value being 26 5 millions.

23,787. What is it for the present year?—I have not the return for 1893. We usually get those returns from the United States, and the report is not out.

23,788. Even supposing that the annual production of silver was doubled or trebled, which would be a very high estimate, the addition to the existing mass would be comparatively insignificant?—Yes; that is of course always the case with the precious metals.

23,789. Then, practically, do I understand from you that the fears of being flooded with great masses of silver are really unfounded as far as their effect would be?—I have not been able to see that they have any justification. I should like to ask exactly what is meant by being flooded with silver. Does it mean that prices would rise to an undesirable extent, or does it mean that silver would take the place of gold? Because if it only means that silver would take the place of gold to some extent in the bank reserves, I see no possible objection to that. If it means that the joint effect would be that we should have too large a supply of metallic money, and that prices would rise in an injurious degree, that appears to me not to be proved or supported by such evidence as I have been able to see.

Prof. H. S. Foxwell.
14 June 1894.

Effects of appreciation of gold.

23,790. I began my examination by telling you that I would ask you to lay a general sketch of your views before the Commission, and that then I would ask you questions upon any details upon which you might desire to state anything further to the Commission. Do you wish to say anything further upon the question of the appreciation of gold?—Upon the effects of it?

23,791. Upon its meaning and its effects; or have you stated as much as you desire to put before the Commission?—I do not know that I have said anything about the effects. I entirely concur with Mr. Giffen as regards the meaning of the phrase. I think it is very convenient that we should understand by the appreciation of gold simply the rise in the purchasing power of gold measured in wholesale commodities. That is the sense in which I have always tried to use the expression. As to the effects of that, I have no doubt that on the whole they have been disadvantageous. I should like, perhaps, to insist upon one or two of those effects, if I may.

23,792. Yes, if you please?—Perhaps I might quote first the opinion of the Commission of 1885-86, which was appointed to inquire into the Depression in Trade and Industry.

23,793. Will you at the same time say anything that you desire to say with regard to labour and wages?—Yes, but that would come later. "We expressed in our "third report," the Commission said, "the opinion "that the fall in prices so far as it has been caused by "an appreciation of the standard of value was a matter "deserving of the most serious independent inquiry, "and we do not therefore think it necessary to investigate at length the causes which have brought it "about, but we desire to give it a leading place in the "enumeration of the influences which have tended to "produce the present depression."

23,794. That was the Commission presided over by Lord Iddesleigh, I think?—Yes.

23,795. Then they laid it down clearly that one of the causes of the great depression in trade, into which they were instructed to inquire, was the appreciation of the standard of value?—Yes.

23,796. (*Mr. Everett.*) "A leading cause," did you say?—"A leading place." That was the report signed by 18 out of the 23 Commissioners—the final majority report. That conclusion of the Commissioners was arrived at after an examination of the actual effects of the depression of trade, and it seems to me that the way in which the appreciation of gold produces those effects is pretty clear. Mr. Giffen himself has said that "an appreciation of the money of a country "forced on by a Government is simply a measure for "disabling the productive powers of the people and making them poorer than they otherwise would be, while "it is of course liable to all the objections that exist "to any measure that changes the contracts between "individuals." It appears to me to be particularly injurious to the productive interest, because upon the whole the productive interest, the producers of the country, are borrowers. They are the people who employ the savings of the country; they are in the position of having to pay interest upon capital; they are in the position of having to pay many other fixed charges, or relatively fixed charges. They find foreign tariffs are fixed, and Customs duties; they find that railway rates are very difficult to move; they find it extremely difficult to bring down money wages, no matter what the purchasing power of the money is. They find therefore that practically they have to deal with a large number of charges which are fixed, or quasi-fixed charges. On the other hand they find that the value of their produce has fallen considerably in the markets. It must be clear that the margin of profit is diminished in that way. Now, if that is so, and if

Prof. H. S. Foxwell.

14 June 1894.

the question whether industry shall be extended or not, whether enterprise shall be undertaken or not, depends mainly upon the interests of these men, the employers of labour; the persons who receive profit or whose object is to receive profit; it seems to me to follow that an appreciation of gold will, on the whole, tend to put a drag upon production. That is the view I take of it; that while, of course, it is not able to stop the production of the country, it distinctly lessens the incentives to an expansion of enterprise; it makes men, to say the least, very cautious, which alone would bring about a considerable contraction of the production of the country. But I think it goes further than that. It in many cases destroys profit altogether, and turns profit into loss, and causes consequently contraction in production. Nearly all that I should have to say about the bad effects of the appreciation of gold would be based upon that point. If production is contracted, or to put it in a less objectionable form, perhaps—a form to which less objection can be taken—if the natural expansion of production is in any way arrested or checked, there would be a positive loss of wealth, and a diminution in prosperity which in the long run would probably be shared by all classes. That falls in the first place upon the employer, who acts as a buffer and suffers the larger portion of the loss in the shape of loss of profits, but ultimately no doubt transmits it to his men in the shape of a gradually lowered wage; and even before the rate of wages has thus been lowered the wage-receiving class will generally have felt the pinch, in the shape either of a positive contraction of employment, or of a diminution of employment below the point which it otherwise would have reached in the natural course of events.

23,797. (*Mr. Chaplin.*) What you want to put before us, I think, is this, is it not, to summarise what you have said, that in a period of falling prices, that is to say, while the appreciation of gold continues, people are afraid of investing their capital in productive industries because the returns are so uncertain, and that ultimately re-acts upon those who are employed and injures the labourers?—Yes, I think that exactly conveys my opinion.

Effects of appreciation of gold on debtors and creditors compared.

23,798. What is the effect upon debtors?—I have assumed that the effect would be to injure the debtor; that it would be adverse to the debtor; the reason being this: the debtor stands bound to pay a fixed sum in sterling value in terms of money, but the money which he is thus under an obligation to pay, although of the same nominal value, has an increased value estimated in the commodities which he produces. The American farmer, whose farm is often mortgaged to the extent of at least 20 per cent., finds himself in this position, that he has to give at least twice as much of the products he raises to pay the interest upon the mortgage. In the same way, the English farmer would find himself paying twice as much if his rent were as fixed, which it is not, as the rate of interest on the American mortgage.

23,799. The effect on the creditor is precisely the opposite,—he gains, I presume, *pro tanto* by the appreciation of gold?—Certainly. I should like to say about the creditor, though, that I am not at all prepared to admit that in the long run, and taking a long series of years, the appreciation of gold will be to the advantage of the creditor or of a creditor country, because the tendency is to ruin the debtor, and the bankruptcy of the debtor is not a matter upon which the creditor can congratulate himself in the long run.

23,800. In fact, if the appreciation of gold continues, the creditor,—the person who has lent his capital, is in danger of losing the whole of it, because of the bankruptcy of his debtor?—I think so. I should like to quote a rather remarkable prediction of Mr. Giffen's upon that point. I think, if Mr. Giffen will excuse my saying so, it really is rather remarkable, in view of the events which have actually occurred. He said in 1888, in the paper to which I have already referred several times:—"Where the debts increase fast, and where "* * * there is no rapid increase of population the "problems involved in the appreciation of money may "at any time become serious. I should look for "troublous times, for instance, both for some of our "Australasian Colonies and for a country like the "Argentine Republic even if the appreciation does not "grow more serious than it has been." We all know how soon that forecast was verified.

23,801. (*Mr. Giffen.*) In speaking of debtors and creditors, I presume you have been speaking of debts contracted for long periods, and not of the ordinary mercantile contracts where debts run off quickly?—It certainly would not affect very much a three months' bill. I have been speaking of the long period debts, which, I understand, are very large in amount.

Prof. H. S. Foxwell.

14 June 1894

23,802. (*Mr. Gilmour.*) It would affect farm leases of 19 years very considerably, I suppose?—Very much indeed. Farmers were recommended, I believe, in the period of rising prices, always to take such leases if they could get them, but in the present time it would be very unwise of them, I think, to accept them.

Effect of appreciation of gold on labour

23,803. (*Mr. Chaplin.*) Do you wish to say anything with regard to the future outlook upon this question more than you have said already?—I should like just to say a word, if I might, as to the effect upon labour.

23,804. If you please. We should very much like to hear it?—I might say first that the passage that I quoted from Mr. Giffen will be found in the proceedings of the Royal Statistical Society, volume 51, pages 761 to 762. I should like to say a word about labour, because it was in connexion with the question of labour that I first felt the importance of this movement of prices, which I had regarded before as an interesting example of theoretical principles, but not more seriously. Mr. Jevons introduced it to me in that light as a very interesting example of the theory of value which he had done so much to perfect and develope. But looking at the question of irregularity of employment it struck me that it had a very important bearing upon the position of labour, and from that time I regarded the question more seriously. It seems to me, as I have pointed out, that although at first, during a period of falling prices, the labourer will gain as long as he maintains his position of employment—as long as he maintains his nominal wage—commodities will cheapen and he will undoubtedly find himself in a better position,—yet in the long run if the movement is carried so far as to destroy the profits of business or seriously to diminish the profits of business, there will be a contraction of industry from which he must suffer, if for no other reason, because the total product of the industry of the world—what Professor Marshall calls the National dividend—becomes less, the amount to be divided is less; and although the labourer, I assume, may gain slightly at the expense of interest—may gain slightly at the expense of rent, and may gain slightly at the expense of profits, yet it has been the opinion of the best economists, and notably of General Walker, as expressed in his book on the wages question, that no substantial gain to labour can be expected from such sources as these; that, in the long run, if the position of labour is to be improved, it must be by an increase in the production of industry, and very largely by an increase in the efficiency of labour itself. It is pretty generally recognised now that the old view which regarded an increase of wages as a thing to be obtained at the expense of profits, or at the expense of some other class, is, on the whole, although not absolutely incorrect, not the view we would put before anyone as in the main the practical substantial view, the ground upon which you might substantially expect to improve the condition of labour. That improved condition, I think, will depend mainly upon the improved efficiency of industry, which seems to me to be checked by this movement of prices. But then the objection is raised that to object to falling prices is to object to cheapness, and that cheapness must be for the advantage not only of the labourer, but of all other classes. On that point, I would like to say that it seems to me that cheapness does not essentially mean low prices. It means increased purchasing power. I am almost ashamed again to refer to Mr. Giffen, but I am bound, as a mere matter of justice, to say that Mr. Giffen has put this most clearly. He put it in a way which impressed me very much at the time, and I do not know that I can improve on his expression. In any case, I feel bound to give him the credit of the distinction.

23,805. I am sure we shall be very glad to hear it?—The passage is this: "When the expressions are "analysed it will be found that 'dearness' and 'cheap-"ness' can have really nothing to do with money "prices; that real 'dearness,' that is a high price in "relation to income, and real 'cheapness,' that is a low "price in relation to income, are the things really "intended"—it is a question of purchasing power—"Things may become cheap in this sense when money "prices rise and dear when money prices fall." Then I have another passage from the French economist

Prof. H. S. Foxwell. 14 June 1894.

Chevalier, which puts the thing, I think, very clearly. He says: "We are not to conclude because commodities "rise in price that people are worse off. If wages and "incomes in general expressed in money rise in proportion, nobody suffers from a rise in prices. If they "rise more than proportionally everyone will be better "instead of worse off. Thus all prices rose after the "discovery of America"—he is speaking of the 15th and 16th centuries—"But people were not worse off; "but just the reverse." There are two kinds of cheapness in fact, and we had one kind in the period from 1850 to 1873. That was a period which the working classes found cheap. Their position was enormously improved in 1873, as compared with what it was in 1850, yet it was a period of rising prices throughout. But the point was that their wages rose more than the prices of commodities. On the other hand, although prices have fallen very much since 1873, I do not say that their real wages have not risen, because I think they have, but they have not risen so rapidly in my opinion, and I think they would have risen still more rapidly if we had been living under a *régime* of rising prices, because industry would have expanded more freely.

23,806. (*Mr. Giffen.*) Do you think the improvement was more before 1873 than it has been since?—More in proportion if you compare it with the period of 1848, when we were on the verge of social revolution.

23,807. (*Mr. Little.*) Are you speaking of labourers generally, or of agricultural labourers?—I was not speaking of agricultural labourers particularly.

23,808. Not now?—No; I was speaking generally of wage-receivers, and perhaps I should have used the term "wage-receivers."

23,809. (*Mr. Chaplin.*) Your contention is that the position of the wage-receiver as regards real wages, improved more before 1873 in proportion than it has done between 1873 and 1893?—I think so, if you take account of all kinds of wages.

23,810. (*Mr. Giffen.*) But you cannot go into the details of that?—No. Of course I do not insist upon my opinion, I merely express it. Then I should like to say that I am rather apprehensive myself that we may have social troubles arising from a fall of prices, and in this way—that although those who have given any attention to the question will see at once that if the shilling which the workman receives in payment of his wage has its purchasing power increased his position is not necessarily injured by a fall of money wages, yet it is extremely hard to get the working man to see that. I observe that he is inclined to set up the doctrine of "a living wage," by which he means apparently a fixed number of shillings. Now that will be a source of very serious danger, I apprehend, because it will be extremely difficult to explain to him that he has to put up with a smaller number of shillings because these shillings have greater purchasing power. I should be very sorry myself to have to undertake such a task. I should probably be met by the retort that if a shilling bought any more so much the better, why should he be deprived of his luck, or something to that effect. But more probably what would be said would be that the shilling had not increased in purchasing power; because as a rule when the purchasing power of money increases our wants increase in at least equal proportion, and the sense of complete satisfaction is not in any way increased but rather diminished, perhaps. The man is not conscious of being better off than he was before and it would be extremely difficult to prove to him that he is better off. The consequence is that he will be inclined to insist, come what may, on at least a fixed money wage. He will probably want a rising money wage; and it would be increasingly difficult to give him that if we are to live under a *régime* of falling prices. That is a point which I think it is very important to hold in view in regard to the question whether falling prices are or are not beneficial.

23,811. (*Mr. Chaplin.*) I suppose the recent coal strike would rather illustrate the argument that you have been using to us?—It was that, as a matter of fact, which suggested the argument to me; which suggested the consideration of the question perhaps more than anything else that has occurred. But it did occur to me in 1888, when Mr. Giffen was reading that paper, and I mentioned at the time in the debate that I thought, although from the economist's point of view it was just the same thing whether a man had more shillings and less purchasing power for each shilling or fewer shillings and more purchasing power for each shilling, yet it made all the difference in the world from the political and social point of view in dealing with the workman himself.

Prof. H. S. Foxwell. 14 June 1894.

23,812. I suppose we may regard the recent coal strike as one of the most important and serious things that has happened in recent days; but do you go so far as to say that the appreciation of gold lay at the root of that?—No, I would not of course say that there were not a great many other influences operating, such as the general labour movement, the new unionism movement, and so forth; but I say that it increases the difficulty of bringing about a compromise or a reasonable adjustment on the question of wages.

23,813. Is there anything further you wish to say on this point?—I do not think I would like to detain the Commission more. There was the other point you raised about the future outlook—whether the fall was likely to be continuous, but that again has already been referred to, and I do not know that I need refer to it again.

23,814. Are there any other matters you would like to bring before us?—There are one or two objections to what I have been stating upon the question of the appreciation of money, that I should like to say a word about if there is time.

Prices of labour and commodities as tests of appreciation of money.

23,815. Will you say what you think on that?—Of late years there has been a tendency to deny the appreciation of money in one or two directions, and one I would like to make an observation about. It has been said that the proper test is not commodities, but labour. Now, it is quite clear to my mind at least, that you cannot take both as the test, because they move in different directions. The tendency of material civilisation is for incomes to increase, measured in commodities. We get more and more power over commodities; that is what material civilisation means. The question is which of these are we to take as the unit when we measure the appreciation of our money? Are we to take the incomes which on the whole are going to rise and have risen, or are we to take the commodities? Now, it has been suggested by Mr. Courtney lately, and by other important writers, that we ought to consider labour as the standard, or rather, I suppose, what is really meant is that we should take incomes generally as the standard. No doubt if you were to make a curve of that kind based upon incomes instead of upon commodities you would get a totally different result. You would, perhaps, have no fall after 1873. But it appears to me that that is an impossible standard for several reasons; first of all because it is an extremely vague one, and in all matters concerned with the regulation of money it appears desirable to have a very definite standard. I can form no definite conception of a unit of labour. I have tried and I have read what has been written about it, but I can find nothing that is exact, nothing that would be at all possible. Secondly, and this is perhaps more important practically, such a unit would not enable us to measure the disturbing effects of currency changes upon business, which seems to me the important point. Business is injured when the prices of commodities fall. It is nothing to a business man to tell him that, notwithstanding that, the value of incomes remains constant. That does not affect the management or the manipulation of his business affairs in the least degree. What depresses trade is a falling in commodities. What you have to aim at therefore is stability in the price of commodities, not stability in the value of incomes, which is not a matter that affects trade at all. I go further than that, and I say it is most desirable that incomes should not be stable in their money value, but should rise. If as a matter of fact they are really rising, if we are every day getting more comforts, a larger control of the commodities and conveniences of life, is it not desirable that that should be indicated in the rise of the money value of the income—that the workman, if he really is getting an improved wage, should see that he is getting more shillings. That appears to me to be very desirable. Then, thirdly, I think it would be grossly unjust, because—and I wish to insist upon this—it amounts to giving the whole advantage of the progress of civilisation to the creditor, and I fail to see on what ground we should do this. If you fix your money by incomes and allow the prices of commodities to fall it comes to this—that the creditor gets the whole advantage of the fall in the prices of commodities, to which, as creditor, he has contributed nothing. The fall in the prices of commodities may be due to the increased efficiency of labour; it may be

Prof. H. S. Foxwell.

14 June 1894.

due to invention; it may be due to the better management of business, to the opening up of different districts in the world—to a hundred things—to none of which the creditor, who is as such a passive person, has contributed. The man who has probably contributed most to this movement of general improvement is the borrower of money, the debtor. But he loses the whole advantage, which, on this system of the labour standard, would be handed over absolutely to the creditor. Now, it appears to me that that cannot be justified; that if we are to give the whole advantage to anyone it should be to the active person, the man who is employing all the capital, who is making the improvements from which the relative fall in the value of commodities results. Then I should just like to say that Jevons agrees on that point—he is a very high authority. He says: "I hold labour to be essentially variable, so that "its value must be determined by the value of the "produce, not the value of the produce by that of the "labour." Mr. Giffen says: "Viewing a long period "dynamically it is beyond all question that commodi- "ties are comparatively steady, and only the money "changes." The commodities are our fixed point in these investigations, it seems to me. Then I pass to another point. We are told that there has not been a fall of prices, because otherwise all prices would have fallen; that is really rather a trifling fallacy; but it has been put forward by very distinguished persons, practical men of business, in this country, and by the financier, Forsell in Sweden. He says you have some prices which, on the whole, tend to rise notwithstanding the general fall. If the fall of prices were due to any such general cause as money, all prices should have fallen. Now, that has been very aptly answered, I think, by Professor Nicholson. He says it is exactly the same thing as if you were to say, watching a number of yachts sailing up and down a river or a stream, that there was no such general fact as the current of the stream, because some of those yachts were going up stream and some going down. If the stream had any current in it, they would all be going down. That is an exact parallel to an argument which is put forward in this country in a great many quarters again and again. Jevons has disposed of it absolutely in his *Investigations*, but they are not always read by the persons who hold this view.

Effect of extension of credit on appreciation of gold.

23,816. (*Mr. Chaplin.*) The argument I understand being this, that because the prices of some particular articles have risen owing to some particular cause, therefore, there cannot have been an appreciation of gold?—Yes; of course the answer would be that the appreciation of gold has had its effect everywhere, and that these commodities would have risen more in the absence of the appreciation of gold. Then it is said that the whole question of the metals is of no importance in modern times because we use so much credit. That is an argument which Sir John Lubbock has used on more than one occasion. He says, "looking "at the money which passes over my counter I find "that only half per cent. of it is gold." That of course is an excessively small per-centage, which would only be found in the case of a City business, but we may take it for purposes of argument as a basis for argument. He argues that, therefore, the quantity of metal can make very little difference to prices. But the conclusion I should draw from the fact, which I admit so far as that case is concerned, would be exactly the opposite. It comes to this, that upon every sovereign is built, according to that estimate, 200 sovereigns of credit: you have 200*l.* worth of other forms of money that are in circulation, and you have only this one sovereign of actual coin. If that is so, it seems to me to emphasise the importance of the coin. Of course, the case given is extreme. Taking the whole of the circulation of the country, one might say that the proportion of credit to coin is, perhaps, 40 to 1. I should not like to put it much higher than that, that the liabilities as compared with the actual metallic available reserves are something like 40 to 1.

Proportion of credit to coin.

23,817. (*Mr. Giffen.*) I do not quite follow. What is the proportion?—That the total banking liabilities, say, 700 millions, compared with the amount of available cash reserves against them, is something like 40 to 1.

23,818. Forty to 1?—When Mr. Jevons made the calculation in 1876 he put it at 20 to 1, but the process of economy—the extension of credit—has gone very much further since that time; and when Mr. Cobb wrote his book, "Threadneedle Street," two or three years ago, he estimated that the available reserves were only about 2½ per cent. of the total liabilities standing against them. In that estimate he excluded the till money of the banks as not being really an available reserve, and I think he was right from his point of view, and that I am right from this point of view in rather taking that view of it. It comes to this:—That every sovereign not only means a sovereign, but it means 40*l.* of credit which rests on the top of it; the extent, therefore, of its scarcity, or of its redundancy, in my opinion, becomes of more, and not of less, importance. There is an illustration of Professor Nicholson's in regard to that, which is very neat and very apt, I think, which I should just like to read. He says "it is as if two architects were disputing as to the best "foundation for a palace; one advocates granite and "the other concrete." He refers in that to the monometallists and the bimetallists. "Well, the defender of "the single-stone foundation gets the worst of the "argument, and he turns upon the defender of the "concrete" and says, "After all, it is of no conse- "quence, because all the important parts of the build- "ing are supported not by the foundations, but by the "first storey. That is the kind of delusion of those who "think that prices depend on credit only, and until "they explain what is the foundation of credit, and "start a bank on this new foundation, we may leave "them in the first storey of their castle in the air." Of course, the point is that the credit rests upon the gold, and increases the importance of the gold rather than diminishes it. I do not know that I wish to detain the Commission any longer, but there is much more that might be said.

23,819. (*Mr. Chaplin.*) What you mean is, that however great and widespread the system of credit may be the foundation of all credit is the metal itself?—Yes.

23,820. And as the metal expands or contracts, credit, I assume, will expand or contract with it?—It is admirably put by Jevons. He says that credit gives a certain latitude to prices without interfering with their ultimate dependence upon metallic money, that "credit gives a certain latitude without rendering prices "ultimately independent of gold." That is the way in which Jevons sums up his investigations on that point. Prices may temporarily rise or fall independently of the quantity of gold in the country, but in the long run they must be governed by this quantity. Credit gives a certain latitude without rendering prices entirely independent. That is a view in which I should entirely concur.

Bi-metallism in England in the 18th century

23,821. Have you other points that you would like to say anything to the Commission upon?—I should like to have said something about the 18th century which has been before the Commission in one form or another; but, perhaps, that is rather ancient history.

23,822. It is with regard to the ancient history?—It is mainly on two points. The first point is that it is frequently said that the ratio varied during the 18th century, and yet we claim that bi-metallism was in existence in that century; and if the ratio varied then, why not under the form of bi-metallism which we propose? I want to point out what I do not think has always been recognised, namely, that even the very imperfect bi-metallism which then existed was hampered in two most important and vital ways.

23,823. Are you speaking of bi-metallism in England during the 18th century?—Yes, it has very frequently been observed that the system was a national one, and that instead of attempting to approximate the ratios of the different nations, there was an attempt to use them as instruments of conflict, just as the tariffs were used at the same period. The idea was to induce the movement of money into a particular country, and for that purpose the ratio was from time to time manipulated, with reference to the ratios in other countries, so as to induce a movement of the metals as required. Newton pointed that out in 1717, and recommended that we should try to observe a parity, to observe a uniformity with the ratios of other countries, and not hostility. However, it is notorious that that is the system which prevailed, and that it was not an international system. But that is not the point I wish to raise now. It was pointed out in 1819, before the Commission on the resumption of cash payments, that during the 18th century there was no real free mintage of the metals, because the mintage was under the control of the Bank of England. Mr. Robert Mushett, who was an officer of the mint, makes this statement: He says "It is notorious that the Bank "of England practically controlled the mintage at that

Prof. H. S. Foxwell.

14 June 1894.

"time, that people were often unable to get their "money minted when they wanted to have their "money minted." That was the first obstruction to the working of the system. The second was by means of the laws of the country at that time, for certainly by the law of England the exportation of the coin of the country—the coin of the realm—was prohibited.

23,824. Do I understand that at the time when these observations were offered by the gentleman whom you have named, the mint then was bound by law to take silver in unlimited quantities?—Yes; it was under the law of 1666, the law of Charles II., which was only repealed I believe, quite recently by Mr. Lowe. Under that law it was bound to coin both metals gratuitously, but practically, I suppose, the Bank was the agent in doing it—I am not quite aware of the exact system—but at any rate it is said most distinctly and it is given in evidence that the Bank did control and obstruct this mintage. Secondly, what was equally important, it was not lawful to export the coin of the realm. As a matter of fact the coin of the realm was often melted down and sworn to as foreign coin, the operation having cost about four or five per cent., which appears to have been the cost of hard swearing at that time. That would account for an agio to that extent, in certain cases where under a properly managed bi-metallic system there would naturally have been an export of coin.

23,825. (*Mr. Giffen.*) As a matter of fact hardly any silver was coined?—That is a very striking thing again. I have the figures of the coinage, and they are almost incredible. Only something like 62,000*l.* sterling, I believe, was the amount coined from 1760 to the Committee of 1819. It seems incredible.

23,826. It was a very small figure, I believe?—That is another point on which I wished to offer an observation. It is sometimes said that that was on account of a strong preference in this country for gold, but in the course of reading in the old pamphlets of that period, to which I have been rather addicted, I have found abundant evidence that the scarcity of silver was loudly complained of during the period, and was the source of the greatest possible inconvenience. All the writers agree that it was due to the over-rating of gold. When Newton was at the mint in 1717 the guinea was rated at 21*s.* 6*d.* He pointed out that that rate was far too high, and in accordance with his recommendation it was reduced to 21*s.*; but it should have been reduced to 20*s.* 6*d.* at least, or something of that kind. The consequence was that throughout the 18th century gold was over valued here in comparison with its rating on the Continent, and no silver was brought to England. The silver was exported to the Continent, and gold came in in large quantities. The effect was that we were *de facto* a gold using country, owing to the over valuation.

23,827. How did it happen, if there were such loud complaints, that they did not alter the law so as to bring in silver?—That is a point I do not understand. I do not know what interests were involved. Probably there were influential persons who did not desire the abolition of the law.

23,828. (*Mr. Little.*) What was the circulating medium for small change,—copper tokens?—There was an immense mass of token money issued, and there were a very large number of small bank notes. Adam Smith mentions bank notes of 1*s.* even; and, what was very striking, at one time they were obliged to coin quarter sovereigns, or rather quarter guineas, worth 5*s.* 3*d.*, so great was the scarcity. Then I wish to point out that in 1774 there was a re-coinage of the gold coin, which was put upon a perfectly sound basis. It was then enacted that the silver coin (which had not been re-coined) should not be legal tender by tale for more than a sum of 25*l.*, but silver might be tendered by weight to an unlimited extent. This, however, of course operated as a check upon the use of silver to a still further degree. So far as I can gather it was not intended to check the circulation of silver. It was based merely upon the then state of the silver coins, which were worn and light as compared with the gold coins which had been newly re-coined; but it had the effect of discouraging the use of silver. That Act continued till 1783, and it then expired, but it was renewed in still more stringent form by the Act of 1798, which enacted that silver was not to be legal tender at all, and silver was not to be coined at all, for it prohibited the coinage of silver altogether.

Prof. H. S. Foxwell.

14 June 1894.

23,829. (*Mr. Everett.*) The Act of 1798 did not affect the legal tender, did it—it only dealt with the coinage?—I believe you are right; I have the Act here and I believe it is so. These things appear to me to be important as bearing on the question whether the adoption of gold was deliberate or not in the 18th century. I do not see any sign that it was deliberate, though there may have been persons who desired it.

23,830. (*Mr. Giffen.*) Still they were giving their minds to it when they re-coined gold in 1774, and took no steps about the silver; surely they were giving their minds to it then?—It possibly does point in that direction; but then in 1696 they in the same way re-coined the silver and did nothing with the gold.

23,831. Was there not a general opinion last century to the effect that you could not have a stable ratio between the metals?—I have not met with that opinion myself, until we come to the discussion in 1819, when it certainly appeared; Ricardo brought it forward very strongly.

23,832. I mean in the pamphlets of last century—I have met with it in them?—Yes, but that was based upon the fact that there were many different ratios prevailing in other countries, and that we had no control over those ratios. It does not appear to me to militate against the arguments for an international ratio at all. I have brought with me a list of the ratios, which were most various.

23,833. I should like to have a list of the ratios?—There is a list of the ratios put in before the committee of 1819, giving the ratios at that time; then there is another list made in 1869 by Ernest Seyd.

23,834. Giving the ratios of the different European countries?—In the different countries. I am afraid it is a little difficult to put my finger on these papers; but I could get them perhaps by to-morrow, and it might be better to do that rather than to detain the Commission now.

[The witness subsequently furnished the following statements]:—

Prof. H. S. Foxwell. 14 June 1894.

The RELATIVE VALUE of GOLD to SILVER in the principal Trading Places of the World, computed from the Proportional Quantity of Pure Metal in their principal Coins, and the Legal or Current Price of those Coins respectively.*

Prof. H. S. Foxwell. 14 June 1894.

——	By Mint Regulations.	By Assays.	Names of the Coins from which the Proportions are taken.
England:			
By old coinage	15 $\frac{2096}{10000}$ to 1.	Proved correct by the Trials of the Pix.	Per guinea and old shilling.
By new coinage	14 $\frac{2778}{10000}$ to 1.		Per sovereign and new shilling.
Amsterdam	14 $\frac{86}{100}$ to 1.	14 $\frac{63}{100}$ to 1.	Per ducat, reckoned at 5$\frac{1}{4}$ flor., and the Rix-dollar.
Hamburgh	15 to 1 nearly.	14 $\frac{83}{100}$ to 1.	Per ducat, reckoned 6 Marcs Banco, and the Rix-dollar.
Paris	15 $\frac{5}{10}$ to 1.	15 $\frac{5}{10}$ to 1.	Per 20 franc piece and 5 franc piece.
Madrid	16 to 1.	$\left\{\begin{matrix}15\frac{85}{100}\\16\frac{42}{100}\end{matrix}\right\}$ to 1.	Per doubloon and dollar of different coinages.
Lisbon	13 $\frac{65}{100}$ to 1.	13 $\frac{33}{100}$ to 1.	Per Joanese and New Crusado.
Leghorn	14 $\frac{65}{100}$ to 1.	14 $\frac{92}{100}$ to 1.	Per Ruspono and Franciscone.
Genoa	15 $\frac{54}{100}$ to 1.	15 $\frac{35}{100}$ to 1.	Per Genovina and Scudo.
Naples	15 $\frac{21}{100}$ to 1.	- - -	Per oncetta and ducat (coinage of 1818).
Venice	15 to 1 nearly.	14 $\frac{35}{100}$ to 1.	Per sequin and ducat.
Petersburgh	15 to 1 nearly.	15 $\frac{25}{100}$ to 1.	Per ducat and rouble.
United States	15 to 1.	15 $\frac{04}{100}$ to 1.	Per eagle and dollar.
Bengal	14 $\frac{857}{1000}$ to 1.	14 $\frac{857}{1000}$ to 1.	Per gold Mohur and Sicca rupee.
Madras	13 $\frac{878}{1000}$ to 1.	13 $\frac{857}{1000}$ to 1.	Per Star Pagoda and current rupee.
Bombay	15 to 1.	15 to 1.	Per gold rupee and silver rupee.
China	14$\frac{1}{4}$ to 1.	- - -	Per tale of gold, and the average price of Spanish dollars.

*Delivered in by Dr. KELLY, April 7, 1819.

[From the LORDS REPORT on the RESUMPTION of CASH PAYMENTS, 7 May 1819, p. 366, Appendix, C. 9. *See also* Appendix, C. 4.]

STATEMENT of the VARIOUS RATIOS in Force in 1869. [From *The Depreciation of Labour and Property which would follow the Demonetisation of Silver.* By ERNEST SEYD. London, 1869, p. 37.]

Single Gold Valuation.

Great Britain	1 to 14$\frac{1}{2}$	The limit of tender to which silver is restricted may generally be taken as 2*l.*
Portugal	1 to 14$\frac{3}{40}$	
Turkey	1 to 15$\frac{1}{10}$	
Chili	1 to 15	
Brazil	1 to 14$\frac{3}{10}$	
Australia	1 to 14$\frac{1}{2}$	

Double Gold and Silver Valuation.

France	1 to 15$\frac{1}{2}$	Payments are legal in either gold or silver. In France, Belgium, United States, &c., the lower silver coins are now debased, and are limited tender.
Belgium	1 to 15$\frac{1}{2}$	
Italy	1 to 15$\frac{1}{2}$	
Switzerland	1 to 15$\frac{1}{2}$	
Spain	1 to 15·477	
Greece	1 to 15$\frac{1}{2}$	
United States	1 to 16	
New Grenada	1 to 15$\frac{1}{2}$	
Ecuador	1 to 15$\frac{1}{2}$	
Peru	1 to 15$\frac{1}{2}$	

Silver Valuation.

North Germany	1 to 15$\frac{1}{2}$	These proportions are only approximate, as gold coin varies in price.
South Germany	1 to 15$\frac{1}{2}$	
Hamburg	1 to 15$\frac{1}{2}$	
Austria	1 to 15$\frac{1}{2}$	
Holland	1 to 15$\frac{1}{2}$	
Sweden	1 to 15$\frac{1}{2}$	
Norway	1	
Denmark	1 to 15$\frac{1}{2}$	
Russia	1 to 15$\frac{3}{7}$	The half Imperial fixed at 5$\frac{3}{20}$ roubles.
Mexico	1 to 15$\frac{11}{20}$	Gold coin of uncertain fineness.
Central America	1 to 15$\frac{11}{20}$	
India	1 to 15	The mohur = 15 rupees.
China		Gold coin not used.
Japan	1 to 15$\frac{1}{2}$	By the recent reduction of the gold cobang.*

* Before this the proportion was 1 to 4$\frac{1}{2}$.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Forty-fifth Day.

Friday, 15th June 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Baron Rendel.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., *Assistant Secretary.*

Professor Herbert Somerton Foxwell recalled and further examined.

Prof. H. S. Foxwell.
15 June 1894.
Consumption of silver before and since 1873.

23,835. (*Mr. Chaplin.*) In your evidence yesterday you explained to us how a fall in prices had followed upon the great monetary changes which you described. It has been urged before us in evidence upon that point that the consumption of silver since 1873 has been greater than it was before that period and some statements of Professor Lexis upon that point were put before the Commission; have you anything to say upon that subject?—I have gone through the statements of Professor Lexis. I am not prepared to dispute any of those statements, but I should like to make one or two remarks that bear upon them: first of all that it is very doubtful whether he has sufficiently distinguished re-coinages from what are really net coinages and additions to the stock of silver in actual monetary use; secondly that a great part of that silver was token silver which would not, in my opinion, have the same effect in supporting prices as standard legal tender silver; and thirdly that a part of that silver was coined at the low valuation at which silver is now current in the market—at the present market valuation; only a part of it—a considerable part I admit—passing at a higher rate, that is at what is sometimes called the nominal rate of either 16 to 1 in the States or at 15½ to 1 in the countries still holding that ratio. But admitting that a very large amount of silver has undoubtedly been used since 1873, it seems to me quite clear that more would have been used if the mints had remained open, and that the closing of the mints therefore may be regarded as an efficient cause in the contraction of the currency to the extent that the closing of the mints has prevented silver from being brought to the mints, which otherwise would have come there. Probably a great deal of silver has been used in the Arts, owing to the low price of silver, which would not have been used in the arts had the price continued to bear the ratio of 15½ to 1 as compared with gold. I cannot concur in Professor Lexis's conclusion, which is that his figures show clearly that the increased production of silver is the probable cause of the fall. It is of course a contributing cause, but what seems to me quite clear is that, had the mints been open, the increased production of silver to which he refers, about 140 per cent., would not have caused the fall in the relative gold value of silver. I see no reason why it should have caused that fall any more than why the 500 per cent. increase in gold should have caused a fall in 1850, provided a system of free mintage on the principle which I have described had been maintained over the period. It is open of course to anyone to say that the system could not have been maintained, but I should differ there. So long as it was maintained it appears to me clear that the gold value of silver could not have fallen; in spite of what Professor Lexis points out—an increased production, not of a very alarming or remarkable kind.

23,836. (*Mr. Giffen.*) Still you do not dispute the fact that more silver has been used in the last 20 years in the bimetallic area than what was used before?—No, I should not dispute that.

Prof. H. S. Foxwell.
15 June 1894.

23,837. (*Mr. Chaplin.*) You have also shown us I think pretty clearly that the fall in prices has been progressive for some years, and you have expressed the opinion that it is likely to continue. I understand that you advocate the adoption of bimetallism for the purpose of arresting that fall in the future and because you hold that there would be more stability in the standard under that system than is the case at present; is that so?—That is my view certainly.

Reasons for advocating bimetallism.

23,838. Would you give us your reasons for holding that view?—That view would rest partly upon the general presumption that where you have two sources of supply each equally likely to fluctuate in quantity, the joint supply would be more stable than either of the separate sources. That is the principle upon which you would go in choosing to select for a water supply two sources rather than to leave yourself dependent upon one, provided there was no reasonable presumption beforehand that both sources of supply would follow exactly the same variations. In the case of the metals we have found as a matter of past history that when silver has been plentifully supplied gold has frequently been scarce; but on the other hand when gold has been plentifully supplied there has sometimes been a comparative scarcity of silver; and there is reason on that general ground to assume that a joint supply of gold and silver will probably be more stable than a supply of either metal separately. I should go beyond that, and I should entirely agree with Ricardo in 1816 that if we were perfectly free to consider which metal we should prefer as a standard, I should prefer silver on the ground that its supply is more likely to be equable than that of gold. The reason I take it is this, and there is very strong evidence to this effect given by geological specialists; I may refer especially to a collection of the opinions of geologists published in a report by Mr. Edward Atkinson on Bimetallism in Europe.—U.S. Consular Reports, No. 87, December 1887; it is to the effect that the supply of silver is very sensitive to variations in the value of silver; in other words if there were a scarcity of silver and the price of silver were to rise it is absolutely certain that the production of silver would increase, —I will not say absolutely certain, but it is very highly probable that the production of silver would increase. That is not the case with gold. We have had a considerable rise in the value of gold over a considerable period, say for instance from 1873 to 1883, during which there was no important increase in the production of that metal. The fact is that the production of gold is a much more precarious matter, depending much more upon accident and much less upon commercial considerations. It appears to me desirable to select for a currency rather a metal whose supply does depend upon commercial considerations and which is sensitive to a rise in price. The great danger, it appears to me, with regard to the currency, is that we may have a scarcity of it. That danger is not so much to be apprehended in the case of a metal like silver as in the case of a

Prof. H. S. Foxwell.

15 June 1894.

metal like gold. Consequently I should hold on both grounds that the joint supply of gold and silver was likely to be more equable and more steady than the supply of gold singly. Perhaps I may say that Ricardo in 1819 altered that view expressed in 1816, but I should like to state his reason, which seems to me a very remarkable reason, which I hardly think the members of the Commission would endorse. He said, giving evidence before the Lords' Committee of 1819: "My only reason for preferring one metal to the other "is its being less variable in value; I had at one "time thought silver would be less variable; but "having heard" (he puts it in a very vague way) "that machinery is particularly applicable to the work-"ing of silver mines, and cannot be applied to increase "the quantity of gold, I now think that gold is the "more invariable metal." I think probably what Ricardo had in his mind was this: he had seen machinery applied to the production of cotton and other fabrics of that kind with a most astonishing result on the price. If the same thing is going to happen to silver, who can say what will be the value of silver? That argument has no force to-day, because machinery is applied equally to the production of both metals, and the devices of metallurgy are applied most freely to the production of both metals, and, therefore, that argument falls to the ground. In any case, it does not appear to me to be a very strong argument, because it rather tends to show that we should have an abundant supply of silver; and as Mr. Giffen says we are to apprehend rather a fall of prices than a rise, what we should require is rather an abundant supply of the monetary metal than a contraction of it.

Stability of ratio between gold and silver.

23,839. Are you of the opinion which is generally shared, I apprehend, that perfect stability in the standard is unattainable but that it is desirable to aim at the greatest stability possible: and is that not one of the main objects which bimetallists have in view?—Certainly. I think it may be said of the English bimetallists, at all events, that they have always put in the forefront the general stability of prices as their main object. I admitted in explaining the causes of fluctuations in price that there are some that we do not expect to eliminate, such as the speculative causes and the market causes; but we think that we can make some advance towards eliminating those causes of variation which arise from the variations in the supply of the monetary metal.

23,840. The fluctuations which arise, so to speak, from monetary causes might be mitigated in your view to a great extent by the adoption of bimetallism?—Yes.

23,841. It has been urged before us in evidence here that there is no experience to show that governments can do anything to mitigate the difficulties of exchange or to fix the ratio between the metals?—I have a very strong opinion that nothing can be more clear than the evidence that governments have had a power in adjusting the ratio. I think it can hardly be disputed. I think for instance, that we had in 1893 a very striking example of the effect of the power which legislation has in affecting the ratio when the ratio was suddenly lowered from 24 to 1 to 34 to 1, within 12 months, by the closing of the Indian Mints, and the subsequent repeal of the Sherman Act. My view is that Governments can affect the ratio because they can very largely control the demand for the metal.

Absolute fixity of ratio impossible.

23,842. (*Mr. Giffen.*) That is a very different thing from saying that they can fix the ratio?—I beg your pardon, the point is the absolute fixing, am I to understand?

23,843. The evidence to which I referred is this: there is no experience to show that governments can do anything to mitigate the difficulties of exchange, or to fix the ratio; although I suppose you would admit that absolute fixity of the ratio probably is impossible, but that fixity for all practicable purposes, can be attained by the action of governments?—There I should wish to draw a distinction. There can be absolute fixity of the mint ratio. Baron Alphonse de Rothschild brought out that point in his evidence before the French Enquête in 1869–70; he said there has never been any variation of the ratio between the metals as money; and he made a very strong point of that; the variation such as it has been, has been in the market ratio between the metals as bullion. He observed that people spoke of the variation in the ratio between the metals, but that that variation had never existed between the metals used as money; in other words the 20-franc piece I presume he meant was never worth more than 20 silver francs, four 5-franc pieces, and *vice versa*. There was no variation in value between the metals as money. The variation, he said, had been between the metals as commodities, as bullion, outside the monetary system. I should not admit that, regarded as money, at all events for domestic purposes, there had been any variation in the ratio, but when you come to international transactions, you use the word money in a slightly different sense. There no doubt there would be a variation, but I should say that the variation had been very slight; and I should like to mention this which was once remarked to me at Manchester, which I think illustrates the amount of the variation which prevailed before the year 1873. A Manchester merchant said to me: "We "never heard of this silver question before 1873; "whatever variations there were they were so slight "that they did not interfere with business, but since "1873," he said, "the first question asked in Manchester "before any business can be done is, what is the price "of silver." That marked a complete change in all the conditions of business transactions in Manchester after the year 1873.

Prof. H. S. Foxwell.

15 June 1894.

23,844. (*Mr. Chaplin.*) Before that period such a question never was asked I understand you to say?—It never seems to have occurred to them to ask it.

Relative production of gold and silver since 1840.

23,845. Have you got any chart which would show the immense change there has been in silver since the period you speak of?—Yes, I have a chart here prepared by Sir Guilford Molesworth, I am afraid it is a very small one, I had hoped that a larger one would have been here. It is a chart which consists of two portions. In the lower portion the relative production of the precious metals is shown in percentages. The percentage of gold produced in relation to silver is marked by *this* varying line. It will be seen that at the beginning of the century the percentage of gold produced in proportion to silver was something like, as far as I can judge by the eye, 35 per cent.

23,846. (*Mr. Giffen.*) Of weight?—Of value at 15½ to 1; it is put in that form; it brings out the same ratios. About the year 1840 the proportion of gold was nearly equal to that of silver, very nearly cent. per cent.; it was about 110 per cent. as compared with silver at 15½ to 1. In 1850 it suddenly rises until it is more than 300 per cent. as much as the quantity of silver—always taken at that valuation. After 1850 it falls until during the period 1873 to 1890, it averages almost exactly 100 per cent. at 15½ to 1. I want to make one remark upon that point which is rather curious. It is rather curious that that period, 1873 to 1890, was the period during which the ratio showed the greatest variation; it was also the period during which the production of the metals followed almost exactly the formerly established mint ratio of 15½ to 1.

23,847. (*Mr. Chaplin.*) During that period the ratio showed the greatest stability you say?—No, if the production of the metals were the matter essentially determining the ratio, then the ratio from 1873 to 1890 ought to be 15½ to 1. The production of the metals followed exactly that. I do not say that would be the cause, but supposing that were the cause, the ratio should remain stable; on the contrary we know that that was the time during which the ratio moved most violently.

Effect of relative production of the metals on the ratio.

23,848. (*Mr. Giffen.*) Of course there is no reason to believe that the proportion of the production of the two things to each other regulates the price?—In my opinion none whatever.

23,849. Then what was the use of mentioning it?—It is an argument constantly put forward—every day it is being put forward in the papers, even in the City papers, dealing with the subject.

23,850. I think it is constantly put forward in bimetallic literature, but I have never seen it in anybody else's writings?—Pardon me, it goes exactly against our principle, which is that the production has nothing to do with it if you have a fixed ratio free mintage.

23,851. I have certainly seen such statements?—I am very much surprised. I cannot conceive how such statements can be put forward by bimetallists. Then there is another point in this Chart to which I should like to call your attention, and that is that during the period in which there was a most remarkable change in the production and supply of the metals, at 1850, the ratio remained very nearly stable. If you look at the chart above, which shows the fluctuations in the ratio,

Prof. H. S. Foxwell.
15 June 1894.

you will require almost a magnifying glass to see those fluctuations; they are only something like 3 per cent. At the time when the production is most steady at about the relative quantities of 15½ to 1 the ratio fluctuates most violently. I have only put in this chart as showing that the ratio was quite independent of extreme fluctuations in the production of the metals during the years 1848 to 1852, whereas after the year 1873 when there were no such remarkable fluctuations, such as might have caused a variation in the ratio, the ratio nevertheless falls away in the most remarkable degree; in a degree which is, I may say, quite unparalleled in the whole monetary history of the world. There is no period in the whole monetary history of the world, so far as I know, when you have a change in the ratio between gold and silver at all corresponding to the change between 1873 and the end of 1893. I put that chart forward to show that the mintage arrangements of France and other countries undoubtedly did have some effect in controlling the variations of the ratio, because directly they were suspended the ratio broke away in a manner unparalleled in previous history.

23,852. (*Mr. Chaplin.*) And this I understand you regard as evidence that is almost irresistible that Governments can do and have done something to mitigate the fluctuations in the ratio between the metals?—It appears to me obvious.

Probable effect of adoption of bimetallism.

23,853. It was suggested in evidence before us that if this system which you recommend was adopted the result would be to create a tremendous panic and a panic which would probably be followed by the calling in of vast sums of money in London; have you any apprehensions of that kind?—No. I have never been able to understand the grounds upon which those apprehensions were held. It is very difficult to answer a suggestion of that kind unless we are informed of the commercial motives which would be likely to lead to such a panic, and I have never seen any such statement. I have seen indeed a statement of this kind that apprehending a premium upon gold people might be inclined to withdraw their gold from the banks and to hold it with a view to some future commercial advantage, but I have been unable to follow out that line of reasoning. In the first place I should say that it seems to me extremely improbable that the bimetallic system would be adopted until there was a general feeling amongst the highest authorities in the financial world that it was a system which might reasonably be expected to be both beneficial and comparatively permanent; that is, permanent for practical purposes. That being the case it is difficult for me to understand how the apprehension should arise.

23,854. (*Mr. Giffen.*) So that until you convert the City there is no chance of bimetallism?—Well, you are better able to gather that, perhaps, than I am.

23,855. (*Mr. Chaplin.*) Perhaps you will be of the opinion that that conversion is in process already?—I should be very glad to think that that was the only obstacle; for if that is the only obstacle I think we should very soon be able to deal with it. But I presume that it would be agreed that a change of that kind would not be entered upon without a reasonable belief on the part of responsible persons that it would probably be a beneficial change, and that being the case I do not see why the apprehension should arise. But then the suggestion appears to be that gold would be withdrawn from the banks in order to buy silver and so to make a profit.

23,856. (*Mr. Giffen.*) I think not?—I have seen that suggestion.

23,857. There is no suggestion of that kind that I know?—I remember seeing such a suggestion in the *Times* and writing a letter in answer to it.

23,858. That was not the suggestion?—I must have misunderstood it, I suppose; but would Mr. Giffen explain to me what the suggestion is? Then perhaps we could deal with it.

23,859. I thought I had explained myself sufficiently before?—Then perhaps it will be sufficient for me to say that I have seen no reasons alleged which appear to me to be reasonable, and to assume the ordinary commercial motives of self-interest; and although people may under extreme circumstances do very foolish things, I do not think in discussing a monetary system we need assume the existence of any but the ordinary motives of self-interest.

23,860. (*Mr. Chaplin.*) There is no object to be gained that you can perceive which would induce people to take such a foolish course as to call in money that is outstanding?—No.

Prof. H. S. Foxwell.
15 June 1894.

23,861. There is another point I should like to ask you a question upon with regard to the evidence which has been given. It has been urged that the fall of prices is only normal, and is another form of cheapness; you would dispute that I apprehend?—I believe I did offer evidence on that point. I certainly should dispute it; I should say that cheapness was not necessarily evidenced by a fall of prices.

Cheapness and fall in prices.

Influence of the bimetallic rates on prices.

23,862. It has sometimes been urged that bimetallism could not assist agriculture unless the ratio were raised to the old par of 15½ to one. Do you agree with that?—Upon that I should say that even if bimetallism did no more than arrest the fall of prices that must be regarded as a relief to agriculture, which is now exposed to a continuous fall; but I think that it would do more than that probably. It would probably almost inevitably bring about some reaction of prices; the degree of that reaction would in my opinion depend mainly upon the ratio which was chosen, upon the precise ratio that is selected between gold and silver.

23,863. (*Mr. Giffen.*) Is there any question of any other ratio being established except that of 15½ to one?—I think that there is a very great question indeed. In fact, I do not know that I need go into details on that point, but I have certainly not heard 15½ to one mentioned very much of late years.

23,864. You did not see a letter of M. Cernuschi in the *Times*?—Yes, I saw that.

23,865. He is the very greatest authority on the subject, is he not?—I should say certainly not the very greatest authority on the subject. He is one of the most enthusiastic advocates, but perhaps for that very reason not the greatest authority. The relief to agriculture would not be solely a question of the rise in general prices produced by the introduction of bimetallism, because agriculture might be specially relieved by an alteration in the price of wheat. I can conceive an alteration in general prices caused by raising the ratio of silver—raising the relative value of silver in terms of gold; but according to my view the alteration which would be produced in general prices by raising the gold value of silver—by raising the ratio in that sense—would not be so great as the special alteration that would be produced upon the prices of commodities imported from silver countries. We might, for example, by raising the ratio 20 per cent., bring about a 20 per cent. rise in the prices of imports from silver countries, but the total effect upon general prices might be only 5 per cent. according to the way in which I look at the question. Therefore, to put it in another way, a very small re-action in general prices might be accompanied by a considerable rise in the wheat price or the price of any import from a silver country; and so the relief to agriculture might be more than proportionate to the general relief caused by a general rise of prices.

23,866. (*Mr. Chaplin.*) What you mean, I think, is this,—and if I recollect aright you have stated that already in evidence,—that the fall in prices is due to two different causes?—Yes.

23,867. The first of them being the appreciation of gold?—Yes.

23,868. Which affects the prices of all commodities alike?—Quite so.

23,869. And that then, in addition to that, a further fall in prices is occasioned with regard to those articles which are the subject of competition with silver-using countries?—Yes, that is exactly the view.

23,870. Thus causing a divergence between the two?—Yes.

Paper-currency countries and bimetallism.

23,871. One witness that we have had before us here gave some evidence with regard to the countries with depreciated paper currency, and it was urged that even if the difficulties of exchange with silver countries were mitigated or removed, agriculture would still be open to all the disadvantages arising from the competition with countries with a depreciated paper currency; have you any observations to make upon that point?—It appears to me that the countries to which you have referred are countries which, in natural and settled monetary conditions, would be using silver; and that the principal reason why they are not using silver is because it is impossible to use silver under the present conditions, the value of silver being so variable, being left entirely to the caprice of the market. If, on the contrary, the position of silver were re-established, if

Prof. H. S. Foxwell. 15 June 1894

some certainty were given to the future of silver, it seems to me highly probable that these countries might return to cash payments upon the basis either of silver alone or of the two metals jointly (it would make very little difference which) if there were a strong bimetallic system in operation. That opinion is, I know, felt and expressed; it has been expressed at all events privately, by many who are not entirely in sympathy with the views of bimetallists, but who think that that is one of the very greatest advantages which the introduction of bimetallism would hold out, namely, that it would facilitate the countries of the world getting upon a solid cash basis, these more backward countries in particular.

23,872. One effect then of the adoption of this system you think might be this: the giving up of the paper currency and the substitution of silver as the basis of the currency instead?—I think it would have a marked effect in that direction, how far of course I cannot say.

Causes of the cessation of French mintage of silver.

23,873. It has been urged also against the adoption of this system that it broke down in the year 1873, and that therefore it might be expected, whenever it was re-adopted, to come to a similar termination again. What is your view upon that point?—I have looked into that question of the actual history of the cessation of French mintage pretty closely. It seems to me that the history of it is quite clear, and is what has been described by M. Emile de Laveleye. M. Emile de Laveleye was in a specially good position for forming an opinion upon this question. I remember to have heard Mr. Gladstone describe him as the greatest publicist in Europe; and he was particularly well acquainted with the history of opinion in European countries. He attributed it undoubtedly to the movement which took place in 1865 or thereabouts, which came at all events very much to the front in 1865, for bringing about an international uniformity of coinage. The prominent idea in the minds of those men was not valuation, it was not the idea of prices; it was not the idea of the general valuation of the money of the world; but it was the idea of uniformity of coins; it was entirely a coinage question with the men of that time. In this country one of the most prominent advocates was Mr. Hendriks, in France M. de Parieu and afterwards M. Chevalier, and there were others in other countries whose names for the moment I forget. With Dr. Soetbeer too it was very much a question of coins; even to his last moments, in the last memorandum he issued, the question was always with him one of coins and coinage. Now it seems to me that in their attempts to bring about a uniformity of coinage, which was in itself a very desirable thing, no doubt, they overlooked the question of the valuation, of the movement of prices that would be caused by the abandonment of silver, which was a far more important question. That was certainly not brought forward very prominently in the debates at that time, and I very much doubt whether more than half a dozen men had clearly in view the effect that would be brought about on the valuations.

23,874. (*Mr. Giffen.*) Was it not rather assumed that gold was sufficiently plentiful?—That was M. Chevalier's opinion. He was always a little dazed, I might say, by the Australian gold discoveries, and I do not think his judgment was very stable. He recommended France to demonetise gold at one time, and afterwards with just the same light heart he recommended France to demonetise silver, within a period of about 15 years.

23,875. (*Mr. Chaplin.*) At the time of the gold discoveries, when gold was being produced in great quantities, he recommended that gold should be demonetised?—Yes.

23,876. In exactly the same way that he recommended afterwards that silver should be demonetised?—Yes. I have been very much struck with the evidence which was given before a French inquiry, perhaps we might call it a departmental inquiry, held in 1869–70. It was entitled an Inquiry on the Monetary Question before the Superior Council of Commerce. It was important, I think, as showing that the really practical men at that time, the men of business and the men of affairs had no desire to give up their system. The matter was brought forward on the part of the Government of the Emperor in connexion with the movement for a uniformity of coinage. A very remarkable Treasury Despatch was sent to the French Government on the 29th of July 1869, in which the Treasury practically said in a very summary way that they refused altogether to consider the question of the uniformity of coinage in which the French and others were interesting themselves, unless the French would first adopt a gold standard. In view of what has happened afterwards, and of the injury to England by the suspension of the silver coinage, it seems to me a very remarkable letter; it is very remarkable to see that the pressure came from this country. This subject was then remitted for consideration to this Committee by the Emperor's Government, and M. de Parieu, who was representing the Government, spoke in very strong terms on the matter. I do not think I am going too far in saying that he hectored the witnesses, especially Baron Alphonse de Rothschild, and treated him with what I should consider a very considerable want of courtesy in attempting to drive him into accepting this view, that France ought to go on a gold standard and ought to have a uniformity of coins. Some of the reasons put forward by the Government may be mentioned here, perhaps. "The great development of wealth and com-
"merce in our time makes gold most fit to be the stan-
"dard," which was the very reason why it was the more necessary to have an ample supply of money. Here the standard is evidently confused, as it so often is, with the medium of circulation. The scarcer metal, gold, was convenient for pocket money, but it was very necessary to have a broader basis for the valuation. Therefore the growth of commerce was really an argument for an increase of money, not for demonetising half the world's money. I beg your pardon, this quotation is from the despatch of our Treasury, though it does express the views which the French Government afterwards adopted. The despatch goes on to say that the Treasury will not negotiate for international coins until France abandons bimetallism, or, as they call it, the double standard. The movement then was rather one of theoretical doctrinaire persons, official economists like Chevalier, or academic students of statistics like Soetbeer, or enthusiasts for metric reform like Professor Jevons in England, and Mr. Hendriks at that time; and it was opposed by the practical business men of France and particularly by the Bank of France who were unanimous on the question, three of the representatives giving evidence and the fourth concurring, and by a large number of other bankers and practical men at the time. I should like to read one sentence from the evidence of the Governor of the bank. First of all I will refer to M. André, who was a banker in Paris. His evidence is remarkable mainly as showing the state of public opinion amongst business men. He remarks that there is a widely spread opinion that the inquiry is not very sympathetically received by men of business. He explains that when people are invited to consider a modification of the *status quo*, their attention is naturally directed to its inconveniences rather than to its advantages; but that the general opinion outside is that the public sees no danger in bimetallism. It prefers the *status quo* to the pursuit of a unification which would seem to be put forward as a foregone conclusion. This is as close a translation as I can give of M. André's remarks. Business, he goes on to say, has been very active and prosperous; why enter upon a profound revolution which existing circumstances do not render necessary and the business of the world does not demand? Then M. Rouland, the governor of the bank, challenges the opponents to show that there is any appreciable inconvenience either to merchants or bankers. These are his words, "The few incon-
"veniences of the law of 1803, do they destroy the
"necessity of the co-existence of both metals as money?
"People speak of these inconveniences as if they had
"profoundly disturbed the country, had profoundly
"compromised its development. It is very much to
"be doubted if people in general have ever heard of
"them. Show us, then, at any epoch, commerce, in-
"dustry, banking, anticipating ruin or difficulty. As
"a matter of fact these inconveniences are extremely
"trifling," *bien faibles*. He goes on to point out that England suffered far greater inconvenience in the greater sharpness of her commercial crises due to her monometallism. Then M. Alphonse de Rothschild also gave evidence. There is one passage which has been put in already, I see, by Mr. Everett, in which he said that in his opinion demonetisation would be ruin. He says in another place, "I cannot enter upon a hypo-
"thetical discussion, I can only argue upon the facts.
"Personally I am entirely for the system of the two
"standards as it exists in France; I think that the
"simultaneous use of both metals is advantageous
"from every point of view; they serve the purposes
"of business jointly, and they permit of the passage

Prof. H. S. Foxwell.
15 June 1894.

"from one money to another according as one or the "other enters more abundantly into circulation. If I "had to choose a system with the experience we now "have, I should not hesitate to decide for the double "standard. The two precious metals in combination "—I cannot sufficiently insist on this point—serve as "the basis of the circulation; the more abundant they "are the more easily is business carried on. I prefer "the abundance of the metals, whether they be gold "or silver, to their scarcity." That opinion was expressed in 1870.

23,877. By Baron Alphonse de Rothschild?—Then one of the directors of the bank.

23,878. Is that the present Baron Alphonse——it must be?—I am not quite certain as to that.

23,879. Then I am to understand from what you have told us that the bimetallic system in France was abandoned against the wish and the representations and the opinion of all these distinguished men of business, whose opinions you have given to us?—I ought to say that they were not all on one side, but certainly there are no names comparable with these, and these represent the Bank of France. Some of the Chambers of Commerce were on the other side, not all the Chambers of Commerce, for they were about equally divided, and some of those which dealt mostly with England were rather in favour of a gold standard, but there was no sign that those men had considered the question of valuation. In their evidence they speak simply of the cost of the exchange, whereas Baron Alphonse de Rothschild raises the question of valuation. I should like to add that M. de Parieu's comment on the evidence from Baron Alphonse de Rothschild is very curious, and shows the tone and the state of the question at that time. He insinuates that the Baron was acting in the English interests, and that the employés at the bank had prepared his evidence. He even goes so far as this. He says: "You and I occupy different points "of view. I take the economic and above all the legis- "lative view of the question, you are taking the busi- "ness view." He was, in fact, practically told that he ought to adopt the principle of the gold standard because it was the view of the Government.

23,880. Do you mean to say that it was a political thing?—I do not mean to say that it had become political then. I think it became political after the German demonetisation; but at that time it was, I think, rather one of the Emperor's many movements in the direction of English policy.

23,881. (*Mr. Giffen.*) Then there was, in fact, a strong party against bimetallism before 1870 in France?—A Governmental party; I do not see any sign that it was a national party, or that it represented any of the general interests of France. But there was a movement on the part of the Government which I think was stimulated by that Treasury despatch.

23,882. (*Mr. Chaplin.*) The argument of those who were opposed to it at that time I understand being this, that business was active and prosperous, and they saw no reason for desiring a change?—That was the argument of the more simple men, if I may say so, like M. André, but the more far-seeing men like Baron Alphonse de Rothschild went further, and they saw a very great disadvantage arising from the disturbance of the valuation.

23,883. I suppose you would say it is because business is generally inactive and unprosperous at the present time that the more simple men in this country desire a change now in the other direction?—I think that is probably the case.

Adoption of gold standard in England in 1816.

23,884. The change to a gold standard in this country, I think, was made in 1816, was it not?—The sovereign was adopted at that time; the change was in process, but it was not completed till 1821 or thereabouts.

23,885. It was made under the Act of 1816?—Yes.

23,886. Under the auspices of Lord Liverpool, I think?—The second Lord Liverpool, following on the advice of his father.

23,887. Is there any reason to suppose that Lord Liverpool at that time at all foresaw the probability of the example of England being followed by other countries, or that he had the least idea of the consequences to the metals which would follow if his example were adopted?—I am not able to say very accurately what the second Lord Liverpool's opinion was, but he acted upon the advice of his father, and it was his father's opinion which was usually quoted. In his father's book, the Treatise on the Coins of the Realm, I see no proof whatever of any consideration of this question of the valuation and the general effect on prices; nor do I see any reference to the policy of foreign countries; no reference whatever, for example, to the enactment of the 15½ ratio in France in 1803, although a number of the most trivial details are inserted with regard to the history of our own coins. It was with the first Lord Liverpool, I think, mainly a question of coinage, of a convenient accurate standard in the sense of a coinage standard, and the broader questions were certainly not discussed.

Prof. H. S. Foxwell.
15 June 1894.

23,888. Is there anything else you would like to state to the Commission in your evidence-in-chief?—I hardly remember what has been stated, because the order of my brief has not been exactly followed, and, therefore, there may be one or two matters untouched, but I do not wish to insist upon them—the examination has been so very long.

Effect of fall in prices on production.

23,889. (*Mr. Giffen.*) I should like to ask you one or two questions to begin with as to the effect of falling prices on production. I should agree that the effect is serious as far as the distribution of wealth is concerned at the time the change takes place, but I gathered from you that you rather thought the effect of a period of falling prices is to diminish the production of the community as compared with a period of rising prices?—Distinctly, as compared with a period of rising prices.

23,890. You said, I think, that you had no particular evidence to give us of facts that you had observed that would confirm you in that conclusion?—I think it is impossible to put in any evidence for this reason; that the general increase of production is due to so many causes many of which are equally continuous under rising and falling prices, but I hold that so far as the movement of prices has any effect a falling movement would, on the whole, discourage production.

23,891. But is it not rather a strong opinion to express without any facts which you have observed to confirm it?—No, because I think it is perfectly clear how the thing works, and it is almost the unanimous opinion, so far as I have been able to gather it, and I have heard a good deal of the business opinion lately of those who are engaged in production.

23,892. Is not the effect of a period of inflation to cause a great deal of waste?—Yes, I admit that incidentally; that is an incidental disadvantage, especially if the rise is sudden, but it depends very largely on the degree of the rise.

23,893. If you have a period of falling prices the effect is rather to check that disposition to inflate and to waste the means of a country in that manner?—Yes.

23,894. And so you have a check to bad production in that manner?—I fully admit that, and I think the curve of prices shows very clearly that there has not been so much speculative inflation.

23,895. So there would be a good deal to say on the other side, that the effect of a régime of falling prices might rather be to make people diligent and persevering and to prevent them indulging in those wasteful measures which they are sometimes apt to indulge in when everything is glowing and prosperous in appearance?—If I may quote a remark that I have printed upon the subject I have said that it is very much like rowing against a stream; the man who rows against a stream has to be on the alert, he has to exert himself, and no doubt does put forth very great energy, but it would be better on the whole to have the current in his favour, especially if his traffic was of much importance.

23,896. Have you never heard of such an opinion as this, which I have frequently heard in the City, that the time of the greatest real prosperity as a rule is the time when prices are falling and when everybody is complaining?—Well, I could not admit that, unless it were that people at that time were looking forward to—and had reason for their expectation—a subsequent recovery of prices.

23,897. That was the undoubted City opinion which I have quoted to you, which I consider a very good opinion, that the real prosperity is greater, probably, at a time like the present, than it is at a time when prices are rising and everybody is confident and happy?—I could not admit that, except in the case of a very extreme rise of prices.

23,898. I merely wish to get it on record that there is a contrary opinion to yours held by people who are

Prof. H. S. Foxwell. 15 June 1894.

in business, and that you have no facts to support your opinion?—Well, of course, I do not know on what facts you established the contrary opinion.

23,899. You have stated no facts to support your opinion?—Quite so.

23,900. That being so, I simply wish to get on record that there is a strong business opinion, in my judgment, the other way?—I should like to ask whether that business opinion is to be found in the productive centres, or amongst what might be called the middlemen in the city?

23,901. It is more a banking opinion than any other opinion?—Then I do not call it in question at all, but I am not speaking of bankers or middlemen in any respect; I am speaking of producers, whether they are in a cotton district or in an agricultural district.

23,902. Still, bankers are connected with many different kinds of business, and know how things go on?—I have had some very remarkable reports from bankers as to the way things are going on in the North of England. A banker in the North of England wrote to me the other day and said it was extremely critical; a man engaged in a position in Liverpool particularly favourable to observation, writes to me that he has never known in 25 years the state of business so critical in Liverpool as it is now. I may say that he has no views upon the currency question at all, and he wrote to me as an old schoolfellow.

23,903. That refers more to the possibility of failures than to the question of the amount of production, I suppose?—I will not pretend to say exactly what it applied to. That was the statement made, that in 25 years he had never known things so critical as they are now.

23,904. Have you looked over the statistics of production and the movements of commerce over a long period of time, say, from the beginning of the century, as regards the quantities and not the values?—Yes.

23,905. Did you not observe that the quantities are much more steady than the values all the way through?—I perfectly admit that. I do not know that I have made it quite clear; I have never stated that the effect of the fall of prices was sufficient to check all the other causes which make things improve. I merely say it has a depressing effect; but invention is proceeding, the opening up of new countries is proceeding, the efficiency of industry is growing, and it would be extraordinary if there were not some advance.

23,906. As a matter of fact, if you look at statistics, you can find no sufficient evidence that there is a much greater production and prosperity, as a rule, in times of high prices than in times of low prices?—I remember being very much struck with some evidence you yourself brought forward at Manchester, at the meeting of the British Association. You had been investigating, I think, the rate of increase of the national capital, and you said you had been struck with the fact that although there was a positive increase, yet everywhere the rate of increase had fallen off after 1873.

23,907. I think if I remember correctly that was a discussion of the recent rate of material progress in England?—Yes, it was.

23,908. In which I referred to certain indications or apparent indications of a falling off in the rate of progress?—Yes.

23,909. But I came to the conclusion that there was in point of fact no falling off?—I am very sorry I have not the paper before me. Certainly that was not the impression left on my mind that you wished to convey.

23,910. That was the impression that I wished to convey by the paper and I may say that since then it has been rather confirmed by further looking into the facts which have occurred since I read the paper at Manchester and since I dealt with the subject. But you have no facts on the subject to contribute yourself?—I have already said that I do not think any facts could be conclusive because they could only show what the actual rate of progress had been and not the particular effect due to the monetary change.

Bimetallism and prices.

23,911. To go on to the other points, I suppose you do not contend that the return to bimetallism, or the introduction of it would prevent a fall of prices in the future?—Not absolutely; it is conceivable that the supplies of the metals might cease, for example, altogether.

Prof. H. S. Foxwell. 15 June 1894.

23,912. Do we not perceive in the table before us that between 1820 and 1850 you had as great a fall of prices as what has happened since 1873?—That was due to very special causes outside the supply of the precious metals, I think.

Fall in prices in 1820–50.

23,913. It does not matter from what cause. It seems a case in point in which you had a fall of prices with both precious metals in use, and with the bimetallic par existing?—I have admitted that that is possible, but do you wish me to go into the explanation of that fall of prices of 1820? It seems to have been mainly due to the contraction of the excessive paper money and banking credit which was expanded during the period of 1790 to 1820.

23,914. Still it occurs with the bimetallic par existing?—Certainly.

23,915. And we know very little what the circumstances of the future will be and we do not know at all but what the same thing might happen again; there is nothing in the nature of bimetallism, is there, to prevent a repetition of this fall of prices?—Of course you might have bad banking again, but I do not think it is reasonable and probable at this time of day that we are going to have the banking of 1810 or 1820 or even of 1780; in fact it is impossible by law, to some extent, because at that time the country bankers put out notes in the most reckless and profuse manner.

Bimetallism and a fall in prices.

23,916. But looking forward to the future can you say that with bimetallism there would be no fall of prices?—I have never said that, but it seems to me extremely probable that the tendency to a fall of prices would be very much mitigated. It is a question of estimate, I quite admit.

23,917. You would not admit that the recent fall of prices has been the result to some extent of the return to specie payments after the use of inconvertible paper?—It would have been less of course if that had not taken place.

Fall in prices since 1873.

23,918. In fact the circumstances of the last twenty years are not unlike those that existed in 1820?—I think so. I think they are very unlike. I do not think there was ever that extravagant banking in the United States for instance—there was nothing comparable to the banking that went on in England in 1780.

23,919. But would you not say in the United States there was inconvertible paper?—Yes, there was inconvertible paper.

23,920. Prior to 1878?—Yes.

23,921. And that there great disturbance had been produced in consequence?—Yes.

Panic of 1873.

23,922. Do you recollect the panic of 1873?—I am not very well acquainted with the details; of course I remember it in a general way.

23,923. Was there ever a greater panic in any country at any time than what happened in the United States in 1873?—I think we had as sharp a panic in 1866, perhaps sharper and more decisive. You may measure the severity of a panic in several ways—by its duration or intensity—but for sharpness and decisiveness I do not remember myself a panic comparable to that in 1866.

23,924. Not even in the United States when no bank stood at all, when in fact they had to pool their money and make special arrangements for the payment of gold and silver?—That seems to me not a very extreme circumstance. In the United States that has been done lately, in fact it has been done two or three times within my recollection.

23,925. It was more extreme in 1873 than lately was it not?—Yes, it was distinctly.

23,926. So that your argument rather is that bimetallism if it had been continued you think might have prevented or mitigated the particular fall of prices which has occurred since 1873?—Yes.

Bimetallism and a fall in prices.

23,927. But you do not put it forward as preventing a future fall of prices when circumstances occur to cause a fall?—I could not assent to a question put in those terms. It seems to me highly probable that with the present supply of silver it would for any period to which we might reasonably look forward—but it is very difficult to look very far forward in these matters—prevent any fall; in fact I ought to say that the strongest objections which I have heard recently brought against bimetallism, and coming from the

Prof. H. S. Foxwell.
15 June 1894.

ablest quarters, have been brought against it precisely on the ground that it would inevitably bring about an inflation of prices. I think the truth lies between the two.

23,928. We cannot very well foresee very far ahead, and we do not know but what after we have introduced bimetallism in 10 years, or 15 years, or 20 years, you will not have circumstances arising which would bring about a fall of prices comparable to what you see now?—Then I should like to ask what would happen if you had not bimetallism in those circumstances—you would have a fall of at least double intensity.

23,929. I do not know what the circumstances will be—I do not profess to know; that is one of the reasons why I think we should be very careful in regulating the future action of the State as to circumstances which we cannot foresee?—I quite allow that; but it seems to me that if the circumstance is a scarcity of money it is likely to have more pernicious effects when you depend merely upon one metal than when you depend upon two.

23,930. Still we do not know very well?—I admit there are uncertainties.

Effect of abandonment of bimetallism on contraction of gold.

23,931. I should like now to ask you some questions about the contraction of gold which took place about 1873 or shortly after, and which you ascribe to the abandonment of bimetallism?—Yes.

23,932. I should like to ask you how far the abandonment of bimetallism really contributed to the contraction of gold; you admit that the questions are quite different?—I quite admit that.

23,933. Then in the list of measures which you referred to you mentioned the suspension of the coinage of silver by Russia and by Austria?—Yes.

23,934. This was part of the demonetisation of silver that went on?—Yes.

23,935. Did these measures contribute in any way to the contraction of gold?—I think that they have incidentally contributed, because the Russian Government has accumulated a very large gold reserve.

Suspension of silver coinage by Russia.

23,936. But Russia was a country of inconvertible paper before 1876?—Yes.

23,937. Which I think was the date of the suspension of coinage; and it has been a country of inconvertible paper since?—Yes.

23,938. In what way could the suspension of the silver coinage in Russia produce a contraction of gold?—I should like to say first that I have found it very difficult to understand what is the real policy of the Russian Government, and I have made some attempts to ascertain in quarters that ought to be well informed, but it appears to be not easy to find out what is being done there. My view would be this: that the large gold reserve which has been accumulated there might very well have been a silver reserve had bimetallism been maintained: but the principal reason why the Russian Government has been obliged to accumulate gold, which it says it holds against this paper, and which it may hold for military purposes possibly also or altogether——

23,939. Do you not think that the military purposes are the main explanation?—Personally I should have been inclined to take that view, if the direct negative had not been asserted by Russia's financial agent in a very strong way.

23,940. As a matter of fact in the military history of Russia they have always given a considerable amount of attention to the accumulation of gold for war purposes—that we do know?—Before 1873?

23,941. I am acquainted with a reference to the subject of Russian accumulation of gold for military purposes at the time of the contest with Poland in 1832 or 1833?—Yes, but I should like to draw a distinction there; no doubt gold would have been desired for military purposes in the 18th century because the difficulties of transit on the part of the precious metals were so enormous.

23,942. But this was the present century?—Yes, but it applies equally to both centuries up to a certain time. When the difficulties of transit were great there might have been an advantage in having gold. At the present time I see no advantage, because the difficulties of transit are practically the same for each.

23,943. But military governments do not seem to think so?—According to my view they are unwilling to rest their war chest upon silver because silver is discredited, and it is impossible to state what the value is, and it is not at the present time readily acceptable for business purposes.

Prof. H. S. Foxwell.
15 June 1894.

23,244. Is that not always the case that the military people go for gold and not for silver as a matter of fact?—I do not know myself any evidence of that.

23,945. Then you are not aware of that evidence which was given by a Rothschild of the time before a Committee of the Bank of England in 1832 or 1833?—I have not seen it.

33,946. In which he referred to the imperative demands of Russia for military purposes for gold?—No doubt that would be correct.

23,947. Was there not a demand for gold at the time of the outbreak of the Russo-Turkish war in 1877–1878?—That was after the demonetisation.

23,948. I am giving you cases before as well as after?—As regards the cases before I was not aware of them.

23,949. Was there not a great demand for gold especially by Wellington in Spain and Portugal at the time of the conduct of the war there—especially for gold?—I am not prepared to say; I have not gone into this matter of military expenditure.

23,950. Of course gold is much more easily carried about in a military chest with an army than silver?—Yes, but I am not aware that the German Government for example in its war operations required any considerable amount of gold.

23,951. As a matter of fact in 1870 or thereabouts the German Government changed its military chest from silver to gold?—After the war.

23,952. After the war?—Yes, but not in order to carry on those operations.

23,953. I think they accumulated a good deal of gold and were most particular about it for their operations?—It seems to me that the principle of requisitions rather puts that on one side; it is a simpler principle.

23,954. I think that this is taking us into a very interesting line of argument but I should rather wish to bring out the fact that the military people attach a great deal of importance to gold as distinguished from silver in their military chests?—Perhaps I ought not to go further in reply to that than to say that the preference for gold has naturally been very much increased by the demonetisation of silver which has discredited that metal and would probably be much less strong if silver were reinstated.

23,955. That particular measure of Russia that you are speaking of, the suspension of the coinage of silver in 1876, caused no immediate contraction of gold at that moment, did it?—No.

23,956. And the same with Austria in 1879?—No, they were only signs of the tendency of European opinion against silver, and were very important from that point of view.

Suspension of silver coinage by Austria, Scandinavia, and Holland.

23,957. Still Austria was a country of inconvertible paper before 1879, and the suspension of the coinage stopped something that was competing with paper and not with gold?—Yes.

23,958. Then were the Scandinavian countries such that the change there, whatever it was, caused no serious demand for gold?—No, not relatively to the other changes.

23,959. It was a small matter?—It was a small matter.

23,960. And the same in Holland?—I should think Holland was the more important of the two.

23,961. It is a very small amount, is it not?—It is relatively a small amount compared with England and France.

23,962. It is a very small amount really because they had some gold before?—Yes.

23,963. And the demand for Italy never became an effective demand, for she rather lost the gold which she took?—Afterwards, yes.

23,964. So that the only important countries in the question which you have referred to, I may say were Germany, France, and the United States?—Yes, practically.

Demonetisation of silver by Germany.

23,965. In the case of Germany the change was not the abandonment of bimetallism, but a change from silver to gold?—Yes, but that was the cause of the

Prof. H. S. Foxwell. 15 June 1894.

abandonment of bimetallism and the beginning of the whole disturbance.

23,966. Still it was not the abandonment of bimetallism by Germany, but a change from silver to gold?—But surely it arose out of the general movement against silver.

23,967. No, the question which it leads up to is this: what you desire is a restoration or a return to bimetallism?—Yes.

23,968. But I am pointing out that what you really wish is something much beyond that?—If you mean something much beyond the old Latin Union system, I of course agree.

23,969. You do mean something much beyond that?—I mean an international bimetallism, and I speak of it in no other sense.

23,970. How much was the demonetisation of silver by Germany—how much silver was actually parted with?—I have the figures; I believe Germany parted with half the total amount which was something like 26 millions.

23,971. What was parted with, about 13 millions?—No, more than that.

23,972. Or 26 millions?—26 millions was something like what they parted with, if I remember rightly. Their sales continued till about the year 1879 when they terminated, and I believe at that time about half their silver was undisposed of; what has happened since I do not know. *The witness subsequently wrote*—Germany sold 28,356,989*l.* worth of demonetised silver up to May 31, 1879. It is supposed that the total surplus silver coin available for sale was about 54,000,000*l.* worth.

23,973. They did not abandon silver altogether, they continued the use of the silver that they had?—Yes.

23,974. And they also made arrangements for coining a considerable quantity of token silver?—Yes.

23,975. That was the extent of the demonetisation of silver by Germany?—Yes, quite so.

23,976. And a certain part of the demand for gold was occasioned not by the change from silver to gold, but by the change from paper to gold?—Yes, in the States, undoubtedly.

23,977. They gave up the notes of small denominations and they made room for a certain amount of gold?—Yes, but then you are assuming that these changes from paper, if they had been made under a bimetallic régime, would necessarily be made to gold.

23,978. The belief is, I believe, that they are necessarily in gold because the amounts are too large for silver?—I do not follow that. The amounts of French trade were very large, but they were very largely based on silver, and they are now based upon it to the extent of 50 millions sterling.

23,979. I am speaking of the actual handling of coin. You want coin of a certain kind to handle?—Yes.

23,980. And the only coin suitable for handling is gold and not silver?—Surely that was not done in the United States, for example, where they still use paper. I have travelled there, and have not seen any gold coin at all.

23,981. If they were to give up the paper, then for certain monetary purposes in daily use they would have to take gold and not silver, because silver would not be suitable?—It seems to me that two questions are raised in your question practically—the abandonment of an *inconvertible* paper currency, which is one thing, and the giving up a paper currency altogether, which I do not admit the United States ever did.

23,982. I am not saying they gave up paper currency altogether?—Therefore they did not require gold for coinage purposes; they merely required it for a reserve.

23,983. Still, if they were to give up certain kinds of paper they would require to use coin for certain purposes, and it would be gold and not silver?—That is a hypothetical question, because they have not done so.

23,984. It arises out of the practical question of what happened in Germany. Germany gave up small denominations about 1871 or 1872?—Yes.

23,985. And that made a certain demand for gold?—Yes.

23,986. Which was not merely a change from silver to gold, but a change from paper to gold?—That is true, but that was not a case of inconvertible paper, but of convertible paper.

Prof. H. S. Foxwell. 15 June 1894.

23,987. No, it was a case of convertible paper?—There was no necessity for the change.

23,988. Still it was done?—Yes.

23,989. And it is a kind of change that might happen with any Government exercising its free right of action in these matters?—It might happen, but the tendency seems to me the other way, rather—in the direction of giving up coin for paper.

23,990. (*Mr. Chaplin.*) For convertible paper?—Yes, for convertible paper; that has been the tendency in the Anglo-Saxon countries.

23,991. (*Mr. Giffen.*) I am discussing the actual history in the past; you describe the contraction of gold as due to the abandonment of bimetallism, and I am mentioning these as causes of the contraction of gold, which were not due to the abandonment of bimetallism at all?—If that argument is to be used I think I ought to make one more remark. There would not necessarily have been a general contraction of prices owing to this adoption of gold by Germany, if silver had been available to take the place of the gold which Germany drew from other countries. That silver would have been available under a bimetallic system, but it was not available after the suspension.

23,992. Perhaps we shall come to that later on, but I am merely getting out the facts that, as a matter of fact, the contraction of gold which we are dealing with was not due to the abandonment of bimetallism directly?—I want to know what the contraction of gold means; does it mean the increase in the value of gold?

23,993. That there was a greater demand for it?—As to that I admit it.

23,994. And a greater employment of it?—If the contraction of gold means a rise in the value of gold——

23,995. I am merely speaking of the actual fact of the greater demand, of the greater employment for gold?—Yes, undoubtedly; I admit that.

Effect of cessation of French mintage of silver on demand for gold.

23,996. With regard to France, did the change that France made about 1873 and 1874 cause a very great extra demand for gold in France than what would otherwise have arisen?—I think so, undoubtedly. This appears to have happened in France during the last 10 or 15 years, if I may judge from the reports of the Governor of the Bank, there has been a very considerable tendency on the part of the people to exchange their metallic money for notes of the Bank of France, and in consequence the Bank of France has now an enormous metallic reserve, of which perhaps 68 millions are gold and 50 millions silver. If France had still been bimetallic and if the value of silver had been maintained all over Europe in the old way, if the fixed ratio had been preserved, I see no reason why France should require to hold 70 millions of gold.

23,997. The French people might have preferred to have gold either in the Bank of France or passing from hand to hand?—I doubt whether it could have got into the Bank of France. How could it have got in? If it had been more in request in Germany for example——

23,998. Perhaps there has been no very great excess of imports of gold into France since 1870?—Yes, I think I have the figures of the reserve here, but surely the gold reserve was not as much as 70 millions? I think they are given in Mr. Hucks Gibbs' book. I see that does give the amount of gold and silver held by the Bank of France at various dates, from 1811 to 1885——

23,999. I am not disputing at all that there is more gold in the bank of France, but how much more gold has France taken from the rest of the world than it would otherwise have taken?—It seems to me that under the circumstances you have supposed—the demand of Germany for gold, for example, and the demand of some other countries, possibly of America—there would have been a tendency to an agio upon gold for those purposes.

24,000. I am speaking of what the demand for France would have been?—Yes, but if there had been an agio on gold for those countries silver would have been taken by preference to the French mint.

24,001. You say that the stoppage of the coinage of silver in France and the abandonment of the bimetallic

Prof. H. S. Foxwell.
15 June 1894.

standard raised a demand for gold in France, but I should like to know how much gold has France taken which it would not otherwise have taken?—It causes a demand in this way, that you cannot bring silver to the mint in France now. The only money which you can bring is gold money.

24,002. But how much?—How much?

24,003. It is a question of degree; you say that this action on the part of France caused a great contraction of gold, and to my mind it is a question of degree?—You mean can I estimate roughly what I think is the excess of gold caused in that way.

24,004. What has France taken that it would not otherwise have taken?—I think probably in the natural course of things, if bimetallism had not been abolished the greater part of the French reserve at this time would have been silver; I think we might fairly say it would have consisted mainly of silver with at least 30 millions of gold less than it holds at present.

24,005. How much?—30 millions.

Monetary changes in the United States.

24,006. Then to come to the case of the United States, that was not a case again of the abandonment of bimetallism, but it was a return to specie payments from inconvertible paper?—Well, I am not prepared to admit that altogether; it is a complicated matter to state.

24,007. As a matter of fact down to 1878 the United States was a country of inconvertible paper?—It was.

24,008. And the change there was from inconvertible paper to gold, not from silver to gold?—As a matter of actual circulation certainly it was so. The actual circulation you mean was not silver at that time?

22,009. The actual circulation was not silver?—No, it was not.

24,010. Therefore, so far as the United States was concerned, the change was from paper to gold?—Yes.

24,011. And the contraction of gold was due to the change from paper to gold?—Yes.

Demand for gold caused by abandonment of bimetallism.

24,012. As far as you have told us then the total demand for gold, which has arisen on account of the abandonment of bimetallism, is that 30 millions of gold that you speak of as having been demanded by France, and all the other changes are certainly changes in the direction of the contraction of gold, but not connected with the abandonment of bimetallism?—We are arguing all through upon different meanings of the term "contraction of gold." You mean that that has been the only positive additional monetary demand for gold in the sense that that is the only additional quantity of gold that has been actually added; but then there has been an increased demand for money in general all over this period.

24,013. Well, can you give us any details of that demand?—The increase of commerce and the increase of population——

24,014. Has there been any increased demand for gold in England?—I think so, undoubtedly.

24,015. Is it not the case rather that there has been a smaller consumption of gold in England than there used to be?—That is exactly the point that I want to bring out. Are we to say that because there has been a smaller consumption there has, therefore, been a smaller demand. The intensity of the demand is not marked by the quantity consumed.

24,016. Then the demand has not been effective unless it has taken the form of consumption?—It has taken the form of raising the price of one metal, namely, gold.

Demand for gold caused by increase of population and commerce.

24,017. You say there has been a great addition to the demand for gold in consequence of the increase of population and matters of that kind?—Yes.

24,018. And in consequence of the demonetising of silver, as a matter of fact, in the countries of Europe and of the bimetallic area generally, whatever demand there has been has been independent of the demonetising of silver, has it not?—I should put it exactly the opposite.

24,019. I mean independent of the abandonment of bimetallism?—I should put it this way: That there has been a very considerably increased demand for money in consequence of the general advance of commerce and the general increase of population, and the general development of new countries; and that in consequence of the demonetising of silver that demand has not been able to be supplied by silver. You say it has only been supplied to a very small extent by gold—30 millions sterling. I admit that. The consequence is the rise in the price of gold, which is really the kind of contraction that I am speaking of all through.

Prof. H. S. Foxwell.
15 June 1894.

Demand for gold caused by abandonment of bimetallism.

24,020. I am also trying to get out of you the extent to which the abandonment of bimetallism has actually led to the demand for gold?—It seems to me that in answering that question you wish me to say how much the extra supply of gold for currency purposes has been, which is a very different thing from the demand for it, I may grant that actually only 30 millions more has been put into circulation in direct displacement of silver.

24,021. Surely the supply of gold in the last 20 years has been very much more than 30 millions sterling?—But not the available supply for monetary purposes. The arts demand has been increasing steadily

24,022. But still, as a matter of fact, the abandonment of bimetallism has caused a comparatively smaller portion of that demand for gold which has taken place?—It appears to me that we allege a scarcity of gold; you reply that very little gold has been added to the circulation; and it follows from our position that very little has been added; but we say very much has been wanted.

24,023. No; my question is, you say that the abandonment of bimetallism causes the demand for gold. I say that the demand has arisen in other ways and not by the abandonment of bimetallism?—If you like to put it in that way I do not object. It might have been supplied in other ways than by gold; but for the abandonment of bimetallism it would have been supplied by silver.

24,024. You cannot show that it would have been supplied by silver?—Yes, as long as the mint law of France remained it must have been supplied by silver, because there was nothing to prevent any man minting unlimited quantities of silver at that mint.

24,025. But a country does not mint unlimited quantities of the metal which is its standard because the metal is there, it only takes the quantity which it thinks is proper?—I do not admit that; it is not a question of what the country thinks proper. It is what the person who possesses the bullion thinks proper, whether he thinks proper to sell to the Bank of England or to the Bank of France—there is absolutely no limit to the sale at either place, or there was none before 1873 in France; and there is none in England now; it is not a question of how much gold we want. We never close our doors to any amount of gold.

24,026. Surely there is such a difference made by the disposition of people as to whether they would accept the metal or not, whether they want it or not for any particular use?—Is not that a question of coinage that we are coming to now—that, of course, I admit.

24,027. I think not?—The quantity of sovereigns is limited.

24,028. For instance, anybody may take gold to the English Mint?—Yes.

24,029. But you know as a matter of fact that there is less gold used in England in proportion to business than in any other country?—But as soon as ever a demand for a monetary metal had asserted itself, and I think we both agree that in the nature of things that demand must have increased owing to the increase of population and of commerce, that demand might have been supplied in two ways under the whole system, and I take it that as soon as gold became scarce on account of the Russian demand for a war chest or whatever the cause may have been, or the American adoption of gold, so far as it did actually adopt gold, then the supply would have been met by silver, and there would have been absolutely nothing to check a silver miner from taking mountains of silver to the French Mint and getting legal tender in exchange for it.

24,030. That would not apply to the case I am taking?—No, but as long as the French Mint keeps open—I do not think it would have remained open permanently—but as long as it did, there was an absolute demand for any amount of silver produced, and therefore the whole valuation of Europe and of the world rested upon this mass of silver which was all available for monetary purposes.

24,031. I do not think you can say that there was an absolute demand for any amount that can be produced, because surely all experience tells us that even when the mint is open a country does not take an unlimited quantity of the metal that is produced. Is there any

Prof. H. S. Foxwell. 15 June 1894.

evidence of a country taking an unlimited quantity?—I have no evidence of a country refusing to take any under the law of free mintage.

24,032. But they must give something for it surely?—They must give legal tender for it of some sort.

24,033. They must give something for it?—They may either give the money back again or they may give legal tender.

24,034. But although you give back the coin for the deposit of the metal at the mint, a country does not make more use of the metal than what it requires for its purposes, and therefore there is no unlimited demand by what takes place at the mint?—That depends very much upon whether the metal is coined or not, in my opinion.

24,035. How much could France afford to take of the precious metal brought to it in that way; what goods would France give? It would not give goods to an unlimited extent for silver which it does not want. (*Mr. Chaplin.*) Is not the fact in point of law this: that the person who finds the bullion has the right of taking it to the mint and requiring it to be coined, and that the metal which has been coined is handed back to the person and he puts it into circulation?—That is one form, but that is not the American form, and not the form recommended by Ricardo, which I think would be better. But still I am prepared to take it on that ground; and I apprehend that you could always have bought wine from the French producers by offering as legal tender French francs. There was never a double price for wine; a gold price and a silver price.

24,036. (*Mr. Giffen.*) That is to say the French people would take as much of the silver as they thought proper—as they required for their purposes—but that they would not take an unlimited quantity of silver any more than an unlimited quantity of diamonds?—Do you mean to say that a Frenchman would refuse a legal tender; I cannot realise the situation of a man who says, "I will not have money."

24,037. I am merely speaking of the actual practice. I am giving you the case of England; anybody may bring gold to the Mint of England?—Yes.

24,038. But as a matter of fact we use less gold than almost any other country in the world according to our habits and customs?—Yes, that is so.

24,039. Is it not the case with other countries as well?—But still there is no restriction. The whole of the African gold can be brought here and can be minted here.

24,040. Yes, but if people pass it away as soon as they get it, and only take what they mean to use, that is not an unlimited demand?—I think it is an unlimited demand for the metal; I think it is an open market.

24,041. The mint is only a machine for turning a certain quantity of gold into coins?—But it is more than that in England.

24,042. And that is not an unlimited demand in any shape or form?—I should say in answer to that in the first place that that is not the actual state of the law here. The purchase is made by the Bank in return for notes. That is the ordinary form, and that makes a slight difference in dealing with it.

24,043. That is only for convenience; the exacting three halfpence makes no difference?—Pardon me; I think it makes this difference. A man might not care to carry coin from the mint; still he will carry about Bank of England notes which are much more convenient. Practically he pays them into his account and gets the power of drawing cheques against the reserve, which is the vital thing. I cannot imagine a man having the power to draw cheques against a reserve held by the National Bank, and yet that those cheques would be refused as a tender for goods.

24,044. You cannot show any evidence as to the nature and habits of the French people which would seem to show that they would have taken silver instead of gold, even if bimetallism had continued in operation?—Yes; I think I can point to this, that there were never two prices inland for silver and gold. If they had been disposed to refuse all silver no doubt that would have gone to a discount. There were not two prices but one. There was not a price in silver francs and a price in gold. I am not aware of any such double valuation; double pricing.

24,045. Is it not always the case that the business is done in the one and not in the two?—I am informed that business is usually done in notes of the Bank of France. It is impossible to say upon what these notes rest. They rest upon the joint reserve of both gold and silver.

24,046. At present they rest upon a joint reserve of gold and silver coins?—Partly, and partly bar.

24,047. But the silver coins are not freely coined at present?—No.

24,048. Then you cannot say how much of the production of gold since 1873 has been used up in consequence of the abandonment of bimetallism about that time, which would not otherwise have been used?—How much has been withdrawn from the Arts for example?

24,049. How much has been used in consequence of the abandonment of bimetallism that would not otherwise have been used?—That is not my argument at all. I do not quite follow the question. I admit, of course, that very little has been used. The whole point of my argument has been that very little money has been used. We should have used silver in addition to the gold which has actually been used.

24,050. You say the abandonment of bimetallism has caused the contraction of gold?—Yes.

24,051. Or contributed to the contraction of gold; and I wish to know how much gold has had to be employed which would not otherwise have been employed in consequence of that abandonment of bimetallism?—The point is that the gold which has been employed has been employed at a higher value because it has had to do double work. My point is not that more gold has been used.

24,052. Let me point out to you that, as a matter of fact, out of about 450 millions of gold which has been produced since 1873, the extra demands of every kind which have arisen have been far more important than any demand which has arisen in consequence of the abandonment of bimetallism. Can you still maintain your belief that it is the abandonment of bimetallism which has caused the contraction of gold with which we are dealing?—I should like to have that phrase of the contraction of gold put into an unambiguous form. When I speak of the contraction of gold I am speaking of an increased demand for gold which has caused a rise in its value. Of course, the quantity would depend on the supply from the mines; the value might rise indefinitely, but we could not increase the quantity used. The evidence of the increased demand, according to my view, is to be found in the increased value which the metal has assumed.

24,053. Suppose, as a matter of fact, that out of the 450 millions of gold produced since about 1870, 100 millions has gone to India, about 80 millions has gone to Russia, and about 240 millions has been used in the Arts as far as I can judge——?—Yes.

24,054. That is to say, you find you have had a consumption of about 420 millions of gold in different ways, and only about 30 millions of it according to your own statement is due to the abandoment of bimetallism?—No, I do not admit that, because, I think, that partly as regards the quantity which has gone to Russia, that is more than there would have been had silver been available equally for use. But still roughly I do not object to the general statement.

24,055. So that on the one side you have no direct evidence of a great amount of gold used in consequence of the abandonment of bimetallism, and you have a great deal of evidence as to the employment of gold which has arisen in different ways and from other causes?—Of course, there is no evidence of a quantity of gold being used which has not been produced—that is quite clear.

24,056. At the same time you have evidence that over the bimetallic area the quantity of silver used has increased in the last 20 years as compared with the time before?—Yes, quite so.

24,057. And that does not shake your belief in the contraction of gold being due to the abandonment of bimetallism?—Not in the least, because it appears to me clear that an indefinitely larger amount of silver might still have been used.

24,058. Might still have been used?—Yes.

24,059. That is a matter of speculation then to some extent?—Not at all, because the fall in its gold

Prof. H. S. Foxwell.
15 June 1894.

price shows that it was a drug in the market. I should have thought it would hardly have been disputed that if the mints had been open large amounts would have been taken to those mints rather than submit to the lower price which has ruled in the market.

Effect of open mints on demand for metal used as coin.

24,060. Is it not the case that the opening of the mints determines nothing as to the quantity of the particular metal that will be used for which the mint is open, that that depends upon the habits and customs of the people using the metal?—No, I could not admit that. I think it depends upon the habits and customs of the people using the metal, whether the metal shall lie as reserve or whether it shall be put in the form of coin. In some countries it would lie as reserve and cheques and notes would be used against it, and in other countries, less advanced countries, it would be turned into coin and used in that form.

24,061. Is not the keeping in reserve as much a use of it as any other?—Yes.

24,062. That is to say certain people put it into reserve rather than use it in making purchases?—If you put it in that way; but that silver in reserve is really in circulation.

24,063. I do not say in circulation, I say in use?—I should say in circulation for all practical purposes; the silver in the Bank of France is circulating in the shape of Bank of France notes. Then in that case I say there is absolutely no limit under the law of free mintage to the quantity of silver which can be so put into circulation.

24,064. Would that apply to any country?—To any country having a law of absolute free mintage.

24,065. So that if you had a country of 500 inhabitants with a law of free mintage you might have all the silver in the world going there if there was free mintage?—They could not refuse any.

24,066. That is to say the people will not take it, or they could not pay for it?—Nobody would take it there.

24,067. The quantity used depends upon the willingness of the people to take it, and their willingness to pay for it; it is not merely keeping an open mint?—Willingness to pay for it. I do not quite follow you when you say willingness to pay for it. What is given in return is the legal tender, that is the payment for the bullion. But you do not want the legal tender unless you have occasion to buy goods, and those who have occasion to buy goods will undoubtedly take their metal to the mint, get legal tender, and buy goods with that.

24,068. If you say a country with 500 inhabitants cannot take the quantity, is not the reason simply that they cannot pay for it and that they do not want to use it; and does not that apply to a country of 500 millions as well as a country of 500. (*Mr. Chaplin.*) Is there any country in the world with 500 inhabitants which has got a mint?—I am quite prepared to take a hypothetical and speculative view of the matter, but I do not think the question raises any real difficulty. A man will probably select as the market for his bullion the mint in that country where he is going to do business, and where he requires the legal tender which he is giving in exchange for his bullion, and he will naturally go to the great commercial countries.

24,069. (*Mr. Giffen.*) But no country is going to take the bullion unless it wants it, and unless it can afford to pay for it?—I do not understand the country paying for it; the country gives legal tender for it.

24,070. Surely all the bullion is paid for by goods in some form or other?—Do you mean to say that you can understand a situation in which people would refuse legal tender as payment for their goods?

24,071. I do not say that they would refuse legal tender; it is a matter of fact. A country would not use more of any precious metal than what it wants to use?—I believe people are always very willing to have any amount of precious metals as long as they are legal tender. My experience is that people do not hesitate at receiving legal tender.

24,072. I must say that I do not quite understand the meaning of legal tender in the use that you make of it?—I use it to cover either a paper certificate, for instance, issued against a bullion bar, or a coin.

24,073. I wish to get out from you what you mean by the mint taking quantities of precious metals, because it seems to me that beyond that is the question what the community wishes of the precious metals; how much it will take and how much it will pay for?—According to my view the community is not consulted except in this way. It is an entirely automatic operation, the taking of bullion to the mint and the obtaining of legal tender. The question may afterwards arise perhaps whether a merchant who has goods to sell will take the legal tender, though I do not see very well how he can refuse it. He certainly could not afterwards bring an action for the payment of the debt.

Prof. H. S. Foxwell.
15 June 1894.

24,074. But as a matter of fact no man will take and keep bullion unless he wants it for some purposes or other?—In France the bullion is left in the bank. They take notes with absolute freedom. I have never heard of anybody refusing to take them.

24,075. Somebody must hold the notes, and he is not going to hold the notes unless he prefers that use of money to any other uses?—I am afraid I do not quite follow the line of argument you are suggesting.

24,076. It is simply this, that no one will take more of money from anyone else unless he really wants it?—I quite admit that, but I have not yet come across a country or a class that is inclined to refuse money.

24,077. He will not take it to the mint unless he is to get something for it?—I think the question should be rather put in another way. He has a stock of goods of which he is anxious to dispose. The owner of the legal tender comes and says, "Here is legal tender for your "goods; money which is current in your country," and my question is, can you state a case where that has been refused?

24,078. Are not notes a kind of goods?—I should like to say that they are a very peculiar kind of goods. They are goods which are everywhere acceptable and always saleable.

24,079. But for the purpose of exchange they are simply goods?—I deny that; I should deny that altogether.

Proposal of bimetallists.

24,080. I will not continue any further this question as to the unlimited demand for a metal owing to the mint being open, but I should like now to ask you what I think you have already stated incidentally, and that is that what you aim at now is not the restoration of the *status quo* in 1873, but you wish for a great extension of the bimetallic area, and particularly that it should include England?—Yes; perhaps even there I might draw one distinction. It is the restoration of the *status quo* in 1873 in this single respect, that at that time all the silver mined could be taken to the mints; and we propose to restore that condition, that all the silver mined can be taken to the mint; but we think that it would be advisable now, in view of the preference for gold as small change which did not then exist to the same extent, to widen the bimetallic area and to base it upon an international agreement.

24,081. That goes much further in the way of extending bimetallism than what existed in 1873, does it not?—Yes, it does extend it in this respect, that in 1873 the world was on the double valuation, and we propose to return to the double valuation, but we propose to return to it by a broader method.

24,082. The only country which had an effective bimetallic arrangement in 1873 as far as I know was France, or, that is to say, the Latin Union?—Still there was no check upon the purchase of silver, the mintage of silver. The whole silver mined might have been at that time turned into money as long as the French Mint was open.

24,083. That is to say, if you had the bimetallic arrangement in France, and India was open to the coinage of silver, and China, and the other Eastern countries?—Yes.

24,084. But you wish now not only to restore the bimetallic arrangement as it existed then but to have it in the United States?—Yes.

24,085. And to have it in Germany, and to have it in other countries, I suppose, which were not then bimetallic?—Yes.

24,086. That is to say, you wish a very great change in the conditions of the use of money generally as compared with what has existed for a long time at any rate?—A change as regards the number of mints open, but not a change as regards the valuation, which will be the double valuation then as it was in 1873.

Prof. H. S. Foxwell.

15 June 1894.

Effect of bimetallism on demand for gold and silver.

24,087. Are you satisfied that in effect the demand for gold would be much diminished if that were done compared with the present demand, and the demand for silver increased?—I think so; I think that there would be a considerable substitution of silver for gold in the reserves, and possibly to some extent in the military hoards, but on that I should not be so confident.

24,088. But that is not a matter upon which you have much experience to go by, in the present state of the world especially?—As regards the hoards or the reserves?

24,089. The whole question, indeed?—As regards the reserves it would be certain, because in order to obtain the price which the mints would offer, there is no question that silver would be brought there.

24,090. Of course there would be the question whether the banks would be willing to deal with silver at all, and questions of that kind?—The people at the banks could not refuse to accept it, supposing that the agreement were entered into.

24,091. Still, questions of that kind would arise?—I fail to see how.

24,092. You mean to say that because the Governments enter into a certain agreement everybody would necessarily make their money arrangements accordingly. Is there not a subsequent stage in the matter?—I think the law of legal tender is everywhere operative within the countries.

24,093. But in the United States you have had two or three different moneys side by side working at the same time?—Never at a discount, so far as I know.

24,094. You have had inconvertible paper, and you have also had, to a certain extent, the use of gold?—Yes.

24,095. Going on at the same time?—They were both legal tender.

24,096. But it was not the legal tender; they were not at the same price at all?—Surely greenbacks were legal tender.

24,097. I speak of the period before 1878. There was a long period before that in which, alongside of the inconvertible paper, which was at a discount compared with gold, you had a very large use of gold in connexion with the imports and exports, and the payment of the debt—interest?—Yes, no doubt.

24,098. And you had also a use of gold in certain States where they would not have paper at all?—Still there was a use of legal tender necessarily.

24,099. The different legal tenders were used at different prices, it was not a uniform legal tender?—It was not a uniform legal tender? I do not quite follow the question.

24,100. I mean to say that 100 dollars in paper would only command 80 dollars in gold, or something of that kind?—As I understand it, paper was the legal tender and gold was not at that time.

24,101. Gold was legal tender, undoubtedly?—The Act had not been actually repealed.

24,102. Gold was legal tender, most undoubtedly? (*Mr. Chaplin.*) But what date was that?—During the greenback period.

24,103. (*Mr. Giffen.*) Gold was most undoubtedly legal tender?—There was nothing in the Legal Tender Act that was violated at that time that I am aware of, because the Legal Tender Act did not prescribe a given ratio between gold and greenbacks, therefore, there was no violation of the law of legal tender that I am aware of.

24,104. I am merely saying that as a matter of fact you had two different moneys in use; you had one dollar exchanged for so much with another dollar, but not at the full value. (*Mr. Chaplin.*) May I ask a question here for the sake of clearness; is this examination now to support the suggestion that the banks might refuse to take the silver? (*Mr. Giffen.*) Certainly?—That I should not admit in the least degree. That there might be two forms of legal tender is possible under the law of the country, but what I have been trying to put forward is, that provided the law of the country established a certain metal or a certain form of paper as legal tender that metal or paper would necessarily be current, to some extent at all events.

24,105. But it would not prevent two different kinds of legal tender pretending to be of the same value, and having the same expression on the face of them, from being accepted for each other, the one at a discount and the other at a premium?—"Pretending," but not necessarily under the Act.

24,106. I am asking you the question as to what the use of gold and silver is likely to be under this new arrangement which you propose, and I am suggesting that possibly they might not circulate at the value which a Government has put upon them, but that they might circulate at another value just as paper and gold circulate in the United States. What is to prevent that?—I have already said in my evidence that I have admitted the possibility of an agio upon one of the metals.

24,107. What is to prevent it?—The case you state is a case where the law of legal tender would be violated, because the law of legal tender would establish the ratio; but the law of legal tender did not establish a ratio, as I understand it, between greenbacks and gold; and if it had then I conceive the agio would not have existed.

24,108. The ratio was established by that expression on the face of the paper—the Government promise to pay so many dollars?—I think it was clearly understood that the paper was inconvertible, and, therefore, that promise had no effect.

24,109. But in the other case the one money would not be convertible into the other except at the pleasure of the people holding it?—No, there would be no necessary convertibility from the one money to the other; I admit that.

24,110. Then the same thing might happen between the metals that happened in the United States between the paper and the gold; what is to prevent it?—You would have to show that one or other of the metals was entirely driven out of circulation.

24,111. Not at all. I am giving you the case that both the paper and the gold were in circulation in the United States?—But not available?

24,112. Yes, available and constantly used?—You are assuming a case of a legal tender which was only legal tender within the given country.

24,113. Are both legal tender?—Yes, but one of those legal tenders was not available outside the country, and the demand for the other, the international legal tender, would be independent of the demand for the domestic legal tender. In the case I am assuming, I assume that we have an international legal tender between the different countries which would alter the situation altogether.

24,114. I am giving you the case that possibly the people might not accept the one just as freely as the other, and that that would have had the same effect upon the value?—That does not appear to be possible under a system of international legal tender. I cannot understand the use for which the metal would not be received.

24,115. But what is to prevent people making their own bargains about it?—That is possible, but I think it has to be shown yet that that has ever taken place.

24,116. Has it not always taken place, has there ever been a case in which gold and silver have circulated at a ratio fixed by the Government?—They have circulated within two or three per cent. of that ratio according to your own evidence.

24,117. That is not circulating at the ratio?—I have admitted that there might be a small agio.

24,118. If a small, why not a large?—I do not admit that for a moment.

24,119. What is the reason for the one if it does not apply to the other?—The reason of the agio under the French system of bi-metallism as I understand it, was this—that although gold and silver were equally legal tender within the French dominions, yet for certain purposes silver was wanted for export for India, which was not within the system, or gold for export to England; and on those occasions either of those metals might rise to a slight agio, generally speaking, in the shape of bar—it was generally bar that was required for those purposes, and for those purposes the bar would be at an agio, which, in extreme cases, went to the amount you mention, two or three per cent.—generally was very much less than that.

Prof. H. S. Foxwell.
15 June 1894.

24,120. Two per cent. is a very great agio, is it not? Yes, but why did that agio arise? Because there were certain countries of the first importance for commercial purposes, which were not then within the commercial system; under the proposed international bimetallism there would be no important countries lying outside the system and for export to which the metals would be required.

24,121. Is that so?—Yes.

Countries to be included in the bimetallic system.

24,122. Is China to be included in the system?—China is a silver-using country.

24,123. Is it to be included in the system?—Not necessarily; I think it would be outside the system probably.

24,124. Would you have all the small countries in the world included in the system?—I do not think it would be essential at all or important in any way; the demand would be so trifling that it would not have any considerable effect.

24,125. That is all you can say about the experience of the United States and other countries which have had two monies existing side by side?—I do not think the question of inconvertible paper is to the point at all, because we do not propose anything of the kind. That is all I wish to say on the other aspect of the question, the French agio.

24,126. I would be content to put some questions bye-and-by about the French agio, but I wish rather to get now what reason you had to believe that the demand for silver would be very much increased under your proposal and the demand for gold diminished. Now I propose to put to you some questions especially upon the point of the practicability of bimetallism, but before coming to that I would like to ask you one or two questions which bear upon it a little. You have made statements which seem to show that bimetallism had caused the steadiness of price between gold and silver in past times; I think that one of the statements was that when bimetallism existed, notwithstanding the great irregularity in the production of gold and silver yet the same relative price was maintained?—Yes.

Effect of bimetallism on prices.

24,127. Now do you think there is sufficient evidence, sufficient knowledge and experience of prices to enable you to say that it is a wonderful thing when there is irregularity of production that the relative prices are maintained. (*Mr. Chaplin.*) Do you mean the relative prices of the two metals. (*Mr. Giffen.*) Of any things?—I think certainly in the absence of any controlling circumstance we should expect a marked disturbanc of price.

24,128. Why? Have you examined that by experience?—I should think that it was a matter of common experience that price varies with the supply very much, although not wholly with the supply but partially with the demand.

24,129. If the supply varies with reference to the demand you may have cases of a great increase in the supply of an article and no change in the price?—If the demand increases in a corresponding degree.

24,130. You may have cases?—Certainly; that is the case of bimetallism and the bimetallic system.

24,131. And you may have cases of a great increase in the demand or in the consumption of an article?—Yes.

24,132. And even a fall in price?—It is possible that would arise; probably from the production upon a larger scale, and in a cheaper form, reducing the cost of production; it might arise in that way.

24,133. I mean that the amount of the production is not a thing to be considered by itself at all; that it should be considered with reference to all the circumstances?—I quite admit that, but I was only bringing that forward as a very common argument, constantly used in this way, that the present fall in the gold value of silver is due entirely to its excessive production.

24,134. I think also you said that in the past times an excessive production that might have produced a fall did not produce it owing to bimetallism?—It produced a corresponding demand at the same time.

24,135. That was the theory?—Yes, that was the theory.

24,136. It is quite possible that you might have had a great increase of production, and in the absence of any demand such as you indicate the demand might have arisen in some other way and the price might have been maintained?—It is quite possible.

Prof. H. S. Foxwell.
15 June 1894.

24,137. You do not dispute that?—Not at all. I think I would go so far as to say that to some extent it was the case at that time—at the time to which we are referring, that is 1850. There was an increased demand, no doubt, about that time for the use of gold.

24,138. Quite apart from the bimetallic arrangement?—Yes, I should admit that.

24,139. That is rather what I wish to get?—I have always admitted that.

24,140. That is sometimes overlooked?—It is sometimes.

24,141. And there are expressions, I think, in the report of the Royal Commission on Gold and Silver which seem to treat it as a very singular thing that, notwithstanding irregularities in the production of the gold and silver during the present century, the relative price was maintained?—Yes, I think they certainly should take into account any what may be called natural variation, perhaps, or customary variation in the demand for gold.

24,142. Then the maintenance of the price really was not quite so wonderful as they seem to think it?—Still, after all allowance for that, it was very sudden. Habits do not change suddenly, whereas the change in production was remarkably sudden, only covering three or four years.

24,143. It is quite possible in the history of the precious metals that you might have a great increase in the production of one metal coincident with a fall in the relative value of the other metal, which did not increase?—It is possible, if it were not too sudden, so that habits might accommodate themselves. Habits change slowly.

24,144. That is not a wonderful thing in the history of the precious metals is it?—I think it is altogether a question of the sharpness of the change made, the suddenness.

24,145. You have had a case lately of a great increase in the production of silver?—Yes.

24,146. Coupled with a fall in silver?—Yes.

Increased production of gold coupled with fall in silver.

24,147. Would you not be rather surprised to find in the history of the precious metals a great increase in the production of gold coupled with a fall in silver?—Coupled with a fall in silver?

24,148. Yes?—That is a new point. I should like to consider it for a moment.

24,149. Surprise has been expressed that the great increase in the production of gold after 1850 did not lead to a fall in gold, but that the price remained steady with silver: and it was assumed that it was the existence of the bimetallic ratio which maintained that state of things. Now, it is said that as soon as this link is removed, immediately you have a fall in silver coincident with the increase in the production of silver; but I find when I look back that there is one very striking case at least of a fall in the value of silver at the very time of a great increase in the production of gold, and at a time also when there were bimetallic ratios in existence. I refer to the fall in silver which took place between 1580 and 1680; you had a great increase then in the production of gold?—Yes, you had.

24,150. And a fall in the value of silver?—There is no doubt about the explanation of that, I believe.

24,151. As a matter of fact the gold increased in quantity, and although there were bimetallic ratios you had a fall in the value of silver?—You had a fall in the gold value of silver?

24,152. Yes?—The rating at that time was the other way. Silver was taken as the standard.

24,153. The ratio of that date was eleven to one?—It was 11·80 to 1 in 1580.

24,154. And in the course of the next 80 years or so it rose to 15 to 1?—Yes.

24,155. That is to say it was a fall in the value of silver?—I put it this way, that it was a rise in the value of gold.

24,156. At any rate there was a change in the relative value?—Yes.

24,157. But during the same period, according to Soetbeer's figures the weight of gold produced, in comparison with gold and silver altogether, rose from a per-centage of 1·7 to 2·7?—Yes.

Prof. H. S. Foxwell. 15 June 1894.

24,158. And notwithstanding that great increase in the relative production of gold you had a fall in the value of silver?—No doubt, but it was a gradual fall, extending over a long period and due to a change of habits undoubtedly. I have admitted that a change of habits might produce important effects taken over a long period, but I should doubt whether there could be a sudden change of habits in a few years.

24,159. Is that not a set-off to a case which has astonished so many people lately that they require the explanation of the bimetallic ratio to explain it, that you had a great increase in the production of gold, and no change in the relative value of gold and silver?—No. I have been trying to draw a distinction all through with regard to the suddenness of the change. I could not admit that within the three years 1849 to 1852 there had been any important alteration of European habits in regard to the use of the metals; but it is quite clear, as Soetbeer observes, that during the century to which you refer there was a very important change in habits and requirements, due mainly to the opening up of foreign trade, which up to that time had been practically non-existent on any large scale, and which caused a very great demand for gold which previously had not existed.

24,160. Was there not a great demand for gold after 1850 which previously had not existed?—I am not aware of any sudden change in the monetary circumstances which would cause a sudden preference for gold in relation to silver. I ought to point out another reason for that great rise in the value of gold. Prices were rising generally, but one effect of the rise of general prices is that you require to have a more valuable kind of money unit than you did before.

24,161. Still we have it that at one time the existence of bimetallic ratios is effective to keep the relative value of gold and silver what it was, and that at another time it is not effective?—No, not quite effective, the rise was very gradual however.

Effect of ratio in maintaining relative value of gold and silver.

24,162. Then it is not the ratio that makes it effective it is not the ratio that keeps the relative value?—The ratio has a very powerful controlling effect. We never had absolutely free mintage, it must be remembered, over that period except in England, and even there I understand it was under great restrictions.

24,163. In the 17th century?—1666 was the first opening of free mintage in this country—gratuitous mintage.

24,164. In that sense you had never free mintage in the world at all?—No.

24,165. There was always a seigniorage or mintage charged in France?—Quite so. I mean more than that; there was not a free movement of the metals during the period. There was not an adequate commercial dealing in the metals at the period to which you refer, and the movement of the metals was restricted.

24,166. Still there was a large amount of dealing?—There was some dealing, but it was dealing under very great difficulties, and under conditions which did not conduce to the working of a bimetallic system.

24,167. (*Mr. Chaplin.*) Do you mean to say that the bimetallic system as you have explained it to us could not fairly be said to have been in existence at that time?—Certainly some of the most important conditions of its free working were not in existence at that time.

24,168. (*Mr. Giffen.*) Were they in existence during the French period?—They were fairly in existence, except that that was only a domestic system.

24,169. You had a mint charge?—You had a mint charge, but that is not an objection.

Bimetallism and a mint charge.

24,170. So you have never had a bimetallic system in existence of the kind that is now proposed without a mint charge?—I am afraid in referring to the Act of 1666 I have really taken the argument off its proper lines. I do not object to a mint charge, and I can conceive of some reason for a mint charge under a bimetallic system, even such an improved system as is now contemplated.

24,171. Still what has been proposed is without a mint charge?—I think it has not been proposed to have a mint charge for bars, but it might be very convenient to have a mint charge for coin.

24,172. But it has been proposed that there should be no mint charge?—It has been proposed that there shall be no mint charge for bars.

24,173. For anything?—Personally I should be against that; I believe most things have been proposed, but I am not aware that there has been any general feeling or set of opinion on that point.

Prof. H. S. Foxwell. 15 June 1894.

24,174. Is that not what has been put about officially. I am not in possession of all the papers of the Bimetallic League?—Certainly not by the Bimetallic League; I can speak positively as to that.

24,175. By Mr. Cernuschi I think it has always been put forward that there has been really no mint charge?—I do not know. We really do not pay such minute attention to the opinions of M. Cernuschi as you seem to do.

24,176. It is not I that pay attention to them, but Mr. Everett told me he was the great founder of the bimetallic theory?—I am afraid that is not strictly accurate; he came in rather late—in 1876.

24,177. Then you do not agree with Mr. Everett?—Not on that particular point.

24,178. Then with regard to the ratio as it existed in France I understand that you do not deny that there may be an agio upon one metal or the other under the bimetallic system?—No.

Effect of an agio on the maintenance of the ratio.

24,179. And you do not see that if there is such an agio it is a contradiction in terms to say that the ratio is maintained when one of the metals is at a premium?—No, I rather adopt there the view of Baron Alphonse de Rothschild, that you have practically a monetary fixity of ratio within the legal tender area, and that it is only when you contemplate the movement of metal outside that area for some special reason into some mono-metallic country that the agio arises.

24,180. Is that so; can you have two prices in the same market? If there is an agio upon the metal for foreign purposes there must also be an agio for domestic purposes; you cannot have two prices at the same time?—There are no two prices for inland legal tender in France and never have been, I believe, nor would there be in the whole of the new bimetallic area. There would be only one price within that area. The ordinary payment would be made in cheques, and no one would know whether the cheque was a silver cheque or a gold cheque, and therefore the question of the two prices would not arise except when you take the precious metal itself in bullion for export, and then no doubt it would arise.

24,181. They do not usually pay by cheques in France, that has never been the rule?—I understand that in that country it is growing. They use 130 millions or more of notes, which practically play there the part that cheques play in England, to some extent.

24,182. Take any past time, is it not the case in France when you wished for 20-franc pieces in gold that you had to pay a premium for them in the period before 1850?—I have heard it stated most distinctly by Frenchmen who had lived through the period that that was not the case; that they never had the slightest difficulty in obtaining gold or silver for ordinary inland uses.

24,183. I have seen it distinctly stated by people who were in France at the time that they had to pay a premium, but, in any case, is it conceivable that if there is a premium of 2 per cent. on gold in bars, and you had gold coins of full weight beside them, you would be paying 2 per cent. for the gold in bars when you could take the coins and melt them down at a very small charge indeed?—The charge is not equivalent, I admit.

24,184. Therefore, if you find a premium of 2 per cent. for gold in bars, that implies that there was a premium upon full weighted gold coin in bars at the same time?—Of course you have introduced one qualification already—the full weighted coin—which would require selection; but I am not aware that there was ever such a premium charged upon ordinary dealings in France, or that it was ever stipulated that payments should be made in gold coin or in silver coin.

24,185. As a matter of fact, there was nothing but the minimum of gold coined in France for purposes that were indispensable?—It was a small quantity.

24,186. There was no general circulation of gold?—It was not very general, nor is it now, I believe. I believe the French prefer notes.

24,187. Can you say the ratio was maintained in France even when you had a premium of a half per cent. on gold, in what sense was it maintained?—I wish I

Prof. H. S. Foxwell. 15 June 1894.

had brought you the passage in which Baron Alphonse de Rothschild speaks of it. He was a man of experience living at the time, and he says distinctly that there was no alteration in the ratio for monetary purposes.

24,188. I am aware of a passage from another Rothschild who affirmed, about 1883, that silver was the money of France, and not gold?—He meant the *de facto* money in circulation.

24,189. The *de facto* money in circulation?—Yes, no doubt; but there was some gold also as a matter of fact.

24,190. There was some gold as a matter of fact, but that gold was used at a premium?—That is what I should not admit, for inland purposes.

24,191. You have just admitted that if it was at a premium for external purposes it must be at a premium for inland purposes as well?—I do not think it follows. There might be difficulties in getting the coin for export. For instance, in Germany there would be very great difficulties. There is a difficulty in getting gold for export in Germany in any form, and there might have been similar difficulties in France.

24,192. Would there not be similar difficulties for internal purposes? You do not tell a man your purpose when you buy gold in the market?—Do you deny the fact that that there is considerable difficulty in getting gold in Germany for export?

24,193. In Germany there is at this moment, and you cannot get it from the Bank of Germany without some difficulty, but I am speaking of dealings in the market; when you go and buy gold you do not go and tell a man whether you want it for external or internal use and he does not care to know?—You only get it in large quantities from large establishments, which put a certain amount of moral pressure upon the applicant and that might amount, perhaps, to a premium of one or two per cent.

24,194. Whatever the motive may be there is a difference in price?—Yes.

24,195. Whatever the motive may be there is a difference in price?—But I still should contend that there was no difference in quoted prices; that prices were not quoted in silver or gold at an agio between one or the other metal—that there was only one price.

24,196. If silver was the *de facto* money the price must have been quoted in the silver money?—It was not, I think, *de facto* in that sense, that there was not a considerable amount of gold in the bank; it was in practical circulation in the hands of the people no doubt, but there was a good deal of gold in France at that time.

24,197. You say it was a *de facto* money?—In 1841 there were 40,000,000 francs in the Bank reserve—you are speaking of the period before.

24,198. From 1820 to 1850?—In 1820 there were 51,000,000 francs of gold. That would be about 2,000,000*l.* in the Bank of France. On the whole, it was no doubt a small gold reserve.

24,199. But still, as a matter of fact, when people wanted gold they had to pay a premium for it whether it was one-half per cent., or one per cent., or one and a half per cent., sometimes two per cent. they had to pay premium for it?—No doubt.

24,200. That was not maintaining the ratio?—How do you explain the fact that there might have been an agio and was an agio on both gold and silver at the same time.

24,201. Was there a real agio on silver at the same time?—I quote it on Newmarch's authority.

24,202. I think that that would be a matter requiring great investigation, because when silver was at a normal premium that really meant that silver was at par; I think it required to be as high as seven per mille or something like that; that was the real par of silver and it was a nominal premium owing to the mode in which the quotation was expressed?—I am not prepared to go into that question now, but I took it really on the authority of Newmarch, who was pretty well aware of these charges, I think.

24,203. I think you may take it from me as a matter of certainty that the way the thing was expressed—the expression in the market was that the nominal premium on silver merely expresses the par of silver with the money at the time?—Of course it would be the same to some extent with gold on which a seigniorage was also charged.

24,204. The position was a little different between gold and silver, and the seigniorage on gold was very much smaller than the seigniorage on silver?—*Ad valorem*, yes.

24,205. So that it does not arise so much with the gold; in fact it was quite insignificant?—Well, of course I cannot quite assent to that without knowing more details.

24,206. Still assuming there is a real effective premium, say of ½ per cent., can you say when such a premium exists that the ratio is maintained?—It is certainly maintained in one sense, namely, that you can discharge all your debts at that ratio.

24,207. But the two metals are not of the same value as expressed in the Mint ratio?—The two metals are not, and I have always admitted that might be the case where the bimetallic area was very limited.

24,208. Nor the full-weighted coins of the two metals?—I should like evidence of that. I am not prepared to admit that without some evidence.

24,209. But still you are not prepared to affirm that the ratio was maintained in the strict and absolute sense of the word?—Certainly not as regards the market ratio on bullion, because there was a demand for one metal or the other for foreign purposes in countries outside the bimetallic area.

24,210. But then how can you maintain that the ratio is maintained; if the market price is really different, even by a fraction, the legal ratio ceases to be effective?—I cannot see that. It seems to me that the question of degree is most important.

24,211. In what way? Nobody would use the metal that is at the slightest premium in the ordinary transactions of life surely?—My argument has been all through that they did not use the metal. They either used coins or bank-notes.

24,212. But they do use the metal?—And I do not admit that the coins ever were at a premium, and the notes, of course, could not be at a premium.

24,213. You practically admitted that they were at a premium in admitting that nobody would pay 2½ per cent. on bars when they could get the coin without paying two per cent.?—I do not admit that they could get the coin; there may have been a difficulty.

24,214. Then the coin was at a still greater premium if they could not get it at all?—For export—I am speaking entirely of export.

24,215. But you cannot have two prices in the same market?—I cannot understand that.

24,216. You cannot have two prices in the same market?—It is possible to get gold in Germany for example without paying any agio, but it is very difficult to get gold for export. You might have to pay a considerable agio for that. There are two prices in the same market according to your way of putting it; but I take it that the purpose for which it is to be used is totally different in the two cases.

French premium on silver after 1850.

24,217. I do not think you can get an unlimited quantity of gold in Germany for export or for any purpose. Was there not a premium on silver in France again after 1850?—Yes, relatively to gold the ratio slightly rose. I wish to correct what I said in my answer just now. My knowledge of the ratios is entirely based on London prices, and I have no knowledge of French quotations, and on referring to your paper I do not find any indication of the source from which you got those French quotations.

24,218. I am sorry to say that there has been an oversight in that matter, but I should be very happy to give you the references to the Blue Books from which these tables are obtained?—I should require to go into that pretty closely before I know exactly what those French quotations mean. Meanwhile any answers that I give in regard to the so-called premiums on silver or gold would be based upon the London prices of those metals, the London ratio, and so far as I can understand the question the London ratio is sufficiently accounted for by the cost of the movement of the metal across the Channel.

24,219. You have not thought worth while yourself to obtain the prices of gold and silver in Paris all over that long period?—I have asked the question, and I have been told distinctly that there are no quotations.

24,220. In Paris?—In Paris. It is a strange thing that all the official tables have been based on London prices.

Prof. H. S. Foxwell.

15 June 1894.

24,221. I think that not only have you these prices that are in my book here, but since then I have obtained possession of quotations of the premium or discount respectively on gold and silver in France from 1820 down to a recent year?—Yes, but I am not prepared now to offer evidence on those.

24,222. There are some quotations you may be quite sure?—They would be prices of bullion presumably.

24,223. I am not sure that the prices of coin could be obtained, but I do not think from that point of view the difference is very material?—Would you go so far as to say there were two prices quoted during that period, in silver and in gold.

24,224. That the price was always quoted in silver in France, and all the quotations were really in silver, and that was the common understanding of the things in France. You cannot carry it any further?—I cannot carry it any further without examining the source of the quotations very closely.

Supersession of gold and silver by inconvertible paper in France.

24,225. I should like to put this further question to you with reference to the point that it was bimetallism in France which maintained the parity between gold and silver. Was it not the case that the effective bimetallism came to an end not in 1873 or 1874 but in 1870 when France became a country of inconvertible paper?—I am not aware that the French Mint was closed during that period.

24,226. It was practically closed during the war?—In what sense practically closed?

24,227. That there was no mint open?—Well that is not the official statement which Mr. Hucks Gibbs obtained. I was not aware of that.

24,228. Whether the mint was open or not both gold and silver were superseded for the time by inconvertible paper?—But the essence of the arrangement remained, the possibility always of getting that price at the French mint.

24,229. But you did not get the price at the mint?—Our information differs there.

24,230. You got gold back, and you got silver back, but you were not going to use these for ordinary monetary purposes when they were at a premium in the paper money of France?—Why not?

24,231. The paper money was at a discount, and everybody used the paper?—You would get the advantage of your premium if the premium exists in the market.

24,232. But as a matter of fact they used the paper?—As a matter of fact I think the effect of the free mintage still remained, that there was always that power of obtaining legal tender in return for your 15½ ounces of silver.

Period of inconvertible paper in the United States.

24,233. That would apply then to other cases, it would have applied to the United States during the war when they had inconvertible paper?—If their mint was open certainly.

24,234. The mints were open, but there was no coinage?—No, and the reason is very clear, because their mint was open at a ratio less favourable to silver than could be obtained at the French mint. It was at 16 to 1, roughly, whereas 15½ to 1 was paid in France, and the metal therefore was taken to France.

24,235. You did not obtain anything at all at the mint; you only got back your silver or gold as the case may be?—You obtained legal tender, which I must insist is a totally different thing to the metal which you bring, because it gives a power of acquitting debt and of purchasing goods quoted at the ordinary prices, domestic inland tender prices. That seems to me to be a very different thing to having an ounce of metal or a given quantity of metal.

24,236. But surely one or the other metal would have been taken freely to the United States Mint because that was always available?—I do not quite understand the point of the question. I do not see why metals should be taken there.

24,237. You suggest to me that people would have taken the gold and silver to the French Mint in 1870, and afterwards when France was a country of inconvertible paper, and then I ask if that would apply to the United States when the United States was a country of inconvertible paper?—I said the silver would be taken to France in preference, because it would receive a better price there than it would receive in the United States; and that appears to me clear; the gold would probably be taken by preference to England which was an open mint for gold.

Prof. H. S. Foxwell.

15 June 1894.

24,238. But would not gold have gone to the United States also, where there was a mint open?—I take it that the currency of the United States was inflated by the excessive issue of the greenbacks, therefore there could be no demand for money at all; on the contrary the tendency was the other way.

Supersession of gold and silver by inconvertible paper in France.

24,239. Was not the currency of France inflated by the issue of inconvertible paper to some extent?—I believe to the extent of possibly 1 per cent., but I think that was the extreme limit.

24,240. I think it went to 2 per cent. if I mistake not?—I am not quite positive, my impression was 1 per cent.

24,241. I speak from my recollection of the time, that at one time there was a quotation certainly of 18 per mille?—Yes, it may be so.

24,242. And you still think the mint ratio would have some effectiveness, although there was no demand for gold or silver in France by that hypothesis?—I dare say it might have shaken confidence to some extent in the price of silver; but still the ratio of 15½ was the established ratio all over Europe and was practically regarded I think as effective at that time.

24,243. But it was not effective, you could not have both gold and silver going freely to the mints under such a condition?—I understand that it was taken to the mints during those years. I should like just to be quite sure of that. I am afraid the table I have here stops in 1869, which is just too early for that purpose, I am not aware that there was a year in which both gold and silver were not coined at the French Mint. That is my recollection.

24,244. I am merely saying that they could not be going into use as money with paper at a discount in competition with them, that it was not an effective mint for that purpose?—I find that a million and three-quarters of five-franc silver pieces were coined in the year 1870, and nearly a million in the year 1871.

24,245. In 1871 you say there was a fall?—There was a great decline.

24,246. What was it in 1872?—77,000 in 1872 and then it rose to 31 millions.

24,247. In 1873?—Yes.

24,248. That was when the price of silver fell even to a greater discount or was beginning to fall to a greater discount than the paper, was that not the case?—It fell more than one or two per cent.

24,249. Exactly somewhat like what happened with Austria in 1879, when they stopped the coinage of silver because they found the silver was becoming of less value than the paper?—Yes, quite so.

24,250. Still, if the parity between silver and gold continued for two or three years when France was in that condition, you can hardly say it was a bimetallic tie which was keeping them together at that time—there was not an effective mint in that sense?—Silver was being coined in various parts of Europe at the ratio of 15½ to one over that period; the whole of Europe was not using inconvertible paper. There must have been a considerable demand for silver at that rate during the inconvertible paper period.

24,251. Europe was inconvertible paper then, was it not?—All over Europe?

24,252. I think excepting France itself and possibly in Belgium and Switzerland there could be no coinage of silver at any ratio at that time?—I am not prepared to say positively; you may be right. I am not quite sure.

24,253. In the United States there was inconvertible paper and there was really no bimetallic tie at that time to support the relative value of gold and silver?—You cannot say, I think, that there was no bimetallic tie in face of the coinages I have mentioned.

24,254. Still it was a very different state of things?—There was never any time when the coinage was suspended.

24,255. Was the mint being freely open and the business going on as usual?—Not in its full vigour certainly. I think it did produce some slight effect on the value of silver.

24,256. You think that the fall of silver began about 1870?—I should not put it so early as that, but it was

Prof. H. S. Foxwell.
15 June 1894.

shaky at the beginning of 1873 before the mint was closed, before the restrictions on mintage began.

24,257. Then you do not quite agree with Mr. Hucks Gibbs ——?—Yes I do.

24,258. Who tries to show that it was not until 1873 that the thing began to go ——?—Pardon me, he says it went a little, but not more than it had frequently gone in previous periods. I think I can read you his words. He admits a slight fall. "The restrictions were "imposed in September; how then came it to pass that "the fall below exchange point began in August, and "that on the 8th of that month the price was a few "hundredths lower than the exchange would warrant. "This fall was insignificant," and so on. "Coming events cast their shadows before"; that is his explanation.

24,259. That is something like what I have said—that it was the apprehended fall in the value of the silver which caused the measure of 1873 and 1874?—The exact opposite, pardon me. "Coming events cast their shadows before," and there were rumours in abundance of the intended action of the French Government.

24,260. I am speaking of my own recollection of what Mr. Hucks Gibbs writes?—I am only concerned to state accurately what Mr. Hucks Gibbs gives as the explanation—that there was a certain vague apprehension as to the closing of the mints before they were closed.

24,261. Still the stoppage of the bimetallic tie in 1870 did not produce all at once the effects which the stoppage in 1873 and 1874 did?—I cannot admit the stoppage of the bimetallic tie in 1870; I am afraid I must object to that expression. I admit that there was not such a vigorous coinage during those years, but still there was coinage always and that shows that the ratio was maintained, because nobody would have taken the silver to the mint to coin it if he could have got a better value outside.

24,262. Still as a matter of fact there could have been very little of the bimetallic tie left after 1870?—I do not understand the suggestion "Very little of the tie left."

24,263. In comparison with the whole movement of silver production and consumption and all the other things that were in operation, there was going on in Paris very little compensatory effect?—I put it in this way: the actual purchases were small, but as the mint was open to purchase at a particular rate, that rate was maintained on the whole. The question of the quantity purchased is not important as long as the sellers are aware that the buyer is open to purchase unlimited quantities.

24,264. You must not only have the mint open, as I understand, but a condition of things in which the gold and silver could really be used as an ordinary legal tender; the case in France was that it was the paper that was really used?—But surely the silver was never refused.

24,265. Yes, but nobody would pay in silver when you could get paper at a discount with which to pay?—He might have his silver minted in order to buy his paper at a discount, but the mintage of silver would still go on.

24,266. Still it was not so freely a legal tender because you had another legal tender that was practically cheaper?—That may be, but still I apprehend that the mint was always open; there was always a buyer in the market to pay that price for silver, and naturally the value would be maintained.

24,267. The mint was not a buyer in the market?—Perhaps the expression is not quite a very good descriptive expression, but it is practically and substantially true that the mint is always open to take the silver and give you that price in legal tender.

24,268. Because it gives you back what you give it?—In my opinion it gives you a very different thing—it gives you back legal tender at a given price.

Legal tender.

24,269. Legal tender simply means that when you have made a contract in money you must fulfil it, it does not mean anything more?—That appears to me quite enough; it is a very important point; it gives you the power of acquitting a contract.

24,270. That is to say, if I agree to pay a man 20 sovereigns the law says I must give him 20 sovereigns; that is the law of legal tender, nothing more, as I understand?—That is not at all my view of the law; that is the common law of England. If you agree to give a man 20 packs of wool you must pay the packs of wool, but that is not under the law of legal tender. I take it that the law of legal tender is that if you contract to give a man legal money of the realm you are obliged to make payment in certain prescribed forms, namely, either in Bank of England notes in England, or in gold to an unlimited extent, or in silver to a limited extent.

Prof. H. S. Foxwell.
15 June 1894.

24,271. That is to say you must fulfil your contract when you have made it?—Every bargain is taken to be made in that way in the absence of any express stipulation to the contrary.

24,272. The bargain is made as the case may be either in gold or in silver, or whatever the contract may be in; in this country the bargain is made in gold, is it not?—As far as the legal tender law goes, a bargain may be made in any way you please in this country, in any commodity you please, but a monetary bargain is taken to be only acquitted by a payment in the legal tender I have described—either in gold or in bank notes.

24,273. For convenience sake the law says if you make a bargain in money it means so and so?—Yes.

Practicability of bimetallism.

24,274. Coming to the question of some things you said about the practicability of bimetallism, I should like to ask you with reference to that opinion of the Royal Commission on Gold and Silver which you quoted, how far they took evidence upon the subject of the practicability—if they went into the questions we have been discussing now at all?—I think, perhaps, one of the Commissioners, Mr. Chaplin, might be better able to answer that question; I do not remember the question of the agio being raised, but I could not speak quite positively.

24,275. With reference to the authority of the Commission, again I would like to ask you if it is of much value when you consider that you had no expert monometallist at all upon it?—I understood that expert monometallists had been invited to join the Commission.

24,276. As a matter of fact were there any monometallists upon it acquainted with the subject from the monometallist's point of view—as Sir Louis Mallet and Sir David Barbour were acquainted with it upon the other side?—I should not like to pronounce a judgment upon the ability of the various members of the Commission, but I think it was generally understood that there were six gentlemen there who were fully qualified to represent the monometallic point of view.

24,277. It came out afterwards that Mr. Courtney who was supposed to be one of the six gentlemen, was not a monometallist at all?—At that time he was.

24,278. I do not think so; in point of theory he was not an adherent of the English monetary system, and he did not agree to the proposition that you could not have a double standard?—No, but that is a mere matter as I take it of economic theory; he was an economist.

24,279. He was not an adherent of the theory upon which the English monetary system was founded?—No, Mr. Leonard Courtney held the usual economic theory on that matter. He held the opinion which, as far as I know, is held by all instructed economists as to the theory of the double standard.

Introduction of gold standard in England in 1816.

24,280. Have you read the debate upon the introduction of the gold standard formerly in England in 1816?—No, I have not. I have read certain extracts from it, but not the whole debate.

24,281. Was it not affirmed then unanimously that there ought only to be the single standard?—I think it absurd—perhaps the expression is rather strong—but I should never think of going there to ascertain what is the true theory, the correct scientific theory of money. Most of those gentlemen who spoke in that debate were less expert on the subject than the gentlemen on the Royal Commission.

24,282. That was agreed to unanimously in Parliament, and no objection was raised?—Upon that point I should think that when they spoke of a single standard they were not speaking of what is now known as a single standard. Quite the contrary. Locke, for example, speaks strongly of a single standard, by which he meant that the silver coin was to be the unit coin and the point from which all measurements and valuations were made; but he never contemplated a disuse of gold. On the contrary, he says again and again that gold was to be rated to the silver coin.

Prof. H. S. Foxwell.

15 June 1894.

24,283. That gold should be used at the market value?—Not necessarily at the market value; at a rate fixed.

24,284. I think that is what he suggests?—The rate was to accommodate itself to the market value, and it was to be fixed by the Government.

24,285. To accommodate itself to the market value was his idea?—The idea of disusing one of the metals which was then current (which I suppose is the modern monometallism) would have never occurred to these men.

24,286. I do not think, as far as I have heard, that the monometallic view is that only one metal should be used at all; the monometallic view is that only one metal should be used as a standard metal?—I should like to know how you are going to provide for the use of the other metal without any link between the two.

24,287. By using it as token money?—Yes, but I am not speaking of token money. I thought we were merely discussing the question of legal tender money now; that is an additional complication which you might bring in.

24,288. You said monometallists proposed the disuse of one metal?—I meant as legal tender money; I think we might leave out the question of token money.

24,289. Token money is legal tender money up to a point?—Up to a point.

24,290. And in some parts of the British Empire, I believe, token money is unlimited legal tender?—I do not for the moment remember a place where it is.

24,291. In any case, the debate of 1816 showed that opinion was unanimous at that time that you could only have one standard money?—I doubt that very much. For instance, Mr. Alexander Baring was very strong against the proposal to adopt the gold standard, and he made a very admirable suggestion of a bimetallic system to which I have already referred.

24,292. In my examination of Mr. Everett I read a passage from the debate at that time, which is in the notes, and I do not wish to read it again, but that seemed to show conclusively that the unanimous opinion at that time, including the opinion of Ricardo and other people, was that you could only have one standard, and it was upon that footing that the measure of 1816 was proposed?—There was no doubt a general feeling in favour of one standard, but I have already said that debate was carried on solely from the point of view of the coinage and of the difficulties which arose occasionally in the exchange of coins, but that general questions of valuation were never raised.

24,293. You are not acquainted with the debate?—I am not thoroughly acquainted with that debate; I am better acquainted with what took place in the Committee on the resumption. I could not admit for a moment that we are to go to a debate in the House to find what is the expert view upon any given question.

24,294. I am not putting it as an expert view; I am putting it as a representation of the unanimous view of English economists made in a public manner and without anybody contradicting the statement?—Of course if you go far enough back in history you can get the unanimous opinion of economists for almost anything.

24,295. Still I am speaking of this as the foundation of the English monetary system and I was pointing out that Mr. Leonard Courtney, who was supposed to be a monometallist, was not an adherent of the English monetary system, because he had discarded a fundamental proposition upon which it is based?—He followed in that respect the opinion of all economists of the present day, and I presume the economists of that day would have done the same. Whatever views they might have held, as to whether it was desirable we should have gold or not, they would not have denied a point of theory which appears to be self evident almost.

Opinion of members of Gold and Silver Commission as to practicability of maintaining the ratio.

24,296. I think I had better read a part of the passage?—I should have pointed to the presence of Mr. Birch, who is certainly an authority in the sense that he is very familiar with the practical and business aspect of the question.

24,297. But not familiar with the literature probably?—Yes, very familiar with the literature too, as I know of my own personal knowledge, having spent two or three days in his house discussing the views of economists upon various monetary questions.

Prof. H. S. Foxwell.

15 June 1894.

24,298. At that time?—During the time the Commission was sitting.

24,299. I should have thought not. Mr. Birch was a very good man in business and very well informed generally but had not got up this subject specially as Sir David Barbour, for instance, had?—I do not know that he had quite so thoroughly got to the bottom of the subject as Sir David Barbour, but he had read the literature very widely—to that I can testify from my own personal knowledge.

24,300. Mr. Birch does not agree with the opinion which has been reported?—He signed the general report.

24,301. He dissented from a part of it?—To some extent.

24,302. I mean as to the maintenance of the ratio?—We discussed yesterday I think the exact nature of the qualification. It was slight, in my opinion; it was a matter of time whether it would be temporary or permanent.

24,303. In what sense do you think the Commission were of opinion that the maintenance of the ratio was practicable—not any ratio, but a ratio like the market ratio at the time?—I think that their opinion was founded partly, perhaps mainly, upon historical considerations and partly upon theoretical considerations.

24,304. That would not justify any idea of going back to 15½ to one?—I do not think that was suggested by them; it certainly has not been suggested by the body to which you referred, the Bimetallic League.

24,305. Do you think it would have satisfied them that the ratio was maintained when a premium upon one metal or the other would have existed?—They were aware that an agio might exist upon one metal or the other. I think that was brought forward in evidence more than once.

24,306. Surely that ought to have been explained in expressing the opinion that the ratio would be maintained and yet that it would not be maintained?—It might perhaps have been stated a little more fully; the clause to which you refer might have been a little more full upon that point; but Mr. Hucks Gibbs has often admitted the possibility of an agio, and has always claimed that it did not in any way interfere with the ordinary working of a bimetallic system. His argument has always been that the agio could not be great, because no one would go much out of his way in the selection of a metal.

24,307. I have read a great deal of what Mr. Hucks Gibbs has written, but I have never been able to see any foundation for the statement that the agio might not be great. It seems to me that if it may be one per cent. it might be 10; he never explains why it may be one and may not be 10?—His argument is this, I think: that it is difficult to conceive of a man insisting on the option of a metal, when either metal is good legal tender, to such an extent as to pay more than a trifling premium for it.

24,308. But if he could hand it over to somebody else getting it at 9 per cent. premium and he knew where he could get 10 per cent. for it, why should not he?—Yes, but who is going to give 10 per cent. premium for one metal when either metal is equally available for monetary purposes.

24,309. There is always the use of the metals for the Arts, for hoarding and for other purposes—not monetary uses at all?—That is very possible.

24,310. They are very large uses?—Yes; if you conceive it possible that the whole of the gold might be abstracted from circulation for these purposes.

24,311. It need not be abstracted from circulation, it might all go to the common price; a certain amount is used in circulation?—Yes, but it is not absolutely necessary.

24,312. Useful?—Yes, useful.

Views of foreign economists as to maintenance of ratio.

24,313. Then I gather from what you state that you do not agree with M. Cernuschi that nothing is to be thought of except the ratio of 15½ to 1?—Personally, I often find myself differing from M. Cernuschi.

24,314. And yet he has been the great author of the bimetallic agitation?—Certainly not. We are accustomed to regard M. Wolowski and Mr. Dana Horton as perhaps the two most important contributors to the

Prof. H. S. Foxwell. 15 June 1894.

theory and general basis of the bimetallic movement historically and theoretically. M. Cernuschi was important but, I think, Wolowski was more important. I am not accustomed to hear M. Cernuschi placed in such a dominant position.

24,315. You deny altogether the position which he claims for himself and which is so generally acknowledged, that Mr. Everett here put forward M. Cernuschi as the great authority on bimetallism?—M. Cernuschi has devoted his life to agitating the question, and I think it is a matter of common experience that agitators are not always the most intimately acquainted with the ins and outs of the movements of which, perhaps, they are the most effective promoters.

24,316. In fact, like other people, you are not all agreed amongst yourselves?—I think, as you say, like other people we have our differences of opinion.

Views as to the ratio to be adopted.

24,317. Then what ratio would you suggest yourself; I think in these notes you suggest 20 to 1?—If that question is to be raised—it is not a question I should have raised myself because I do not attach very much importance to my own opinion—I admit that the settlement must be based on estimates which are difficult and in regard to which I should like to have some more statistical information and a little more light; but so far as I have been able to form an opinion, putting it forward merely as my personal opinion, I have come to the conclusion that something like 1 to 20 would probably be ultimately the best ratio.

24,318. On what sort of information do you proceed in calculating your ratio?—First of all there is a distinction I should like to make; you might proceed to calculate what would ultimately be the best ratio from this point of view:—which ratio would ultimately give the greatest stability of price, supposing it to be permanently established. You might, for instance, come to the conclusion that 1 to 20 was that ratio. But then another question arises. You have to consider the situation from which you start, which may be perhaps 1 to 34, and the question arises of the transition from what is the present market ratio to what might be in the abstract the best. There are two questions in fact and I certainly am not prepared to say that we should instantly adopt a new market ratio by going from 1 to 34 down to 1 to 20; but I think if we could pass by reasonable transition measures to a fixed ratio, the best fixed ratio would probably be somewhere about the proportion of 1 to 20.

24,319. I do not quite gather your reasons for fixing that 1 to 20?—We should have to take account of a great many things. We have to take account, first of the extent of the bimetallic area, the number of nations which are likely to come in, and the number of nations which are likely to stay outside that area, and from that we should form some estimate of the probable influences which might tend to disturb the value of the metal within the bimetallic area.

24,320. How can you form any estimate; what I am asking is, what are the precise data that would guide you?—The data as to the export to the East are pretty well known. We have them all from time to time accurately given.

24,321. Would the East not be within the bimetallic area?—I think probably not; I should think certainly not as regards the far East.

24,322. Not India?—I do not see the advantage of including India; the public mind is now filled with the apprehension that silver is going to fall.

24,323. I thought the Indian Government had been the great agitators for bimetallism?—Not necessarily for India. The point of view from which they advocate bimetallism is that they wish to see the use of silver restored in Europe.

24,324. They wish other people to be bimetallic and not themselves?—I think the situation is perfectly clear. If you adopted bimetallism in India you would not increase the use of silver because silver is used there now absolutely. Nothing but silver is used there now. What you would do would be to open out the possibilities of a concurrent use of gold in India, and that would not tend to solve the silver question. It is not required from that point of view.

24,325. I thought what you wished to arrive at was a ratio that would leave the use of the metals indifferent so that the natural distribution would go on quite properly at the ratio?—Yes, I think that.

24,326. Therefore India might be within it?—India might be within it, but then I look at it from rather what may be called in a sense the political point of view. People's minds are full of a fear that silver is going to fall. They want to see a new use provided for it, they do not want to see a new use provided for gold.

Prof. H. S. Foxwell. 15 June 1894.

24,327. You cannot give us any further indication what the ratio ought to be and what principles should guide you in selecting your ratio?—I think the most important principle of all is that that ratio should be selected which upon the whole is most likely to give you a stable supply of monetary metal, a stable level of prices.

24,328. How can you know what ratio is most likely to do that?—It is of course quite clear that the higher the ratio you choose, the more favourable to silver, and the larger will be the supply of the monetary metal. I think that is perfectly clear.

24,329. Then the ratio of one to one would be the best?—The ratio of one to one would be the best, why?

24,330. Because that would put the highest value upon silver. If you make one ounce of silver equal to one ounce of gold, that puts the highest possible value you can upon silver?—Surely you would have too great an inflation of prices.

24,331. I do not think you would?—Professor Marshall, whose opinion on this matter has been carefully formed, I believe, thinks that even 1 to 25 would give you an inflation of prices.

24,332. (*Chairman.*) As I understand you, you think that the ratio to be adopted is that which is most likely to result in stable prices?—Yes, looking at the thing broadly. Of course in speaking about the establishment of a ratio you would have to consider the historical situation and the circumstances of the different countries, and that would introduce considerations to which, from the theoretical point of view, I, of course, do not allude.

24,333. (*Mr. Giffen.*) I am afraid I find your language a little vague if I may say so; I should like to know more definitely what you mean?—I allude to the fact that you have coins in circulation at the ratio of 15½ to 1.

24,334. And that points to its being no use of attempting anything but the ratio of 15½ to 1?—To me it seems a perfectly indifferent consideration, but it does not appear so to everyone, It appears a matter of indifference to me, because according to the views which I think are very current now in bimetallic circles, the bimetallic mintage would mainly be a mintage consisting of a return of paper or certificates for bars, and the old coinages might remain, as they are now, in use at a nominal value above the intrinsic value of the metal contained in them. Therefore you need not disturb the coins.

24,335. You do not know very well what would happen?—Yes, we do, I think, as far as this point is concerned.

24,336. I wish you would tell us in your own judgment what ratio you would prefer and for what precise reasons, then I think we should have something to discuss?—I think I have told you that the ratio I should personally prefer would be 1 to 20.

24,337. For what reasons—why not 1 in 19?—As to that, the thing is not susceptible of very precise determination. It is of course rather a choice of 1 to 20 and 1 to 25 or something of that kind, something about that point. There is an obvious reason for selecting a round number.

Effect of ratio of 10 to 1.

24,338. Why not 1 in 10?—I entirely agree with Professor Marshall that if such a ratio were chosen you would have an inflation of prices which would be intolerable, and which would be a greater evil perhaps than the fall of prices we are trying to correct.

24,339. Would it not be the case that you would simply have silver prices all over the world; do you consider it would not?—It does not make much difference, I think, but you would have inflation.

24,340. You have no inflation now in India but silver prices as I understand are pretty much what they were 20 years ago, and there is no inflation?—No, but there is a slight depreciation of silver beginning now I think.

24,341. Why should there be inflation when you go over to silver altogether?—The production of silver is not now very excessive because the ratio prevailing

Prof. H. S. Foxwell. 15 June 1894.

between silver and gold in which the profits of most silver mines are estimated is 1 to 34, or 1 to 33 as the case may be, but if you were to raise that ratio to 1 to 10 you would enormously increase the profits of silver mining, and therefore enormously increase the production of silver, and you would have in my opinion an inflation of prices.

24,342. That is to say if you could raise the effective price of silver?—Yes.

24,343. But if you only substituted silver as the standard money of the world everywhere and there was no greater demand for silver and no less demand all the prices would become silver prices?—That would be so, but I can hardly conceive the displacement of the whole of the gold in circulation.

Effect of ratio of 20 to 1.

24,344. Then suppose you had the ratio of 20 to 1 would the immediate effect be to depress prices in silver and raise them in gold or *vice versâ*; what would it be?—To depress prices in silver. I think the silver valuations would move very slowly because they are so dependent on custom. They have shown themselves singularly refractory.

24,345. Then the immediate effect would be to diminish the purchasing power of gold very greatly as compared with what it is now?—I think it would bring about a diminution in the purchasing power of gold.

24,346. Would it not be immediate?—I think it might perhaps begin a little before the actual change took place, and that is one of the very reasons why I am not proposing to make any change suddenly.

24,347. The effect would be then to diminish enormously the purchasing power of gold?—Not enormously.

24,348. Surely if you alter gold in relation to silver, if you alter the relation from 33 to 1 to 20 to 1, and silver prices do not change, then the purchasing power of gold must be changed enormously, not only in reference to silver, but in reference to everything else?—I do not follow that argument quite. Would you state it again a little slowly?

24,349. If you alter the relation between silver and gold from 33 to 1 to 20 to 1, and silver prices and other commodities do not rise?—When I say silver prices I mean prices in silver countries—it is not quite the same thing.

24,350. Surely the prices in the one country would be the same as in the other in silver?—Only in regard to those articles that were in commerce between the two.

24,351. What would be the effect as regards prices generally of altering the relation from 33 to 1 to 20 to 1?—I think there would undoubtedly be a rise in prices. As to the amount of the rise, that is rather in dispute; there are some who think the amount would be excessive and therefore choose 25 to 1.

24,352. Therefore you would lower the value of silver very much as counted by commodities?—No, because you would raise it very much in reference to gold. I think on the whole you would raise the value of silver in commodities considerably.

24,353. You would raise it in reference to gold?—You would raise it in reference to gold, and you would lower the value of gold slightly at the same time and by the same operation; and the net effect of that would probably be considerably to raise the value of silver measured in commodities.

24,354. Surely if prices rise in silver, that means a reduction of the purchasing power of silver?—Yes, it does.

24,355. And that is what you anticipate, then—a reduction in the purchasing power of silver?—No. Did I say prices rose in silver? I say the value of silver rises; that is a totally different thing—the exact opposite.

24,356. Then prices would fall in silver?—Prices would fall in silver slightly.

24,357–69. That is to say you would have prices lower than they are now?—I should like to consider that matter a little further, and if you have no objection I propose to put in a memorandum on the subject.

(*The witness subsequently handed in the following memorandum*):—

1. *Immediate Effects.*

The gold-price of silver in the open market in the vicinity of the bi-metallic mints would rise to the point corresponding to this ratio:—
viz.: 47·15*d.* per oz. (Mint price) or 47·074*d.* (Bank price).

There would be a corresponding rise in the pars of exchange with silver-using countries.

Assuming that the Indian mints were simultaneously re-opened to the free mintage of silver, the new par of exchange with the rupee would be 1*s.* 6*d.*·834, or nearly 1*s.* 7*d.* the rupee.

2. *Effects on General Prices in Western Countries.*

The increased mintage of full legal tender silver money, together with the increased effectiveness given to existing silver reserves by the re-establishment of silver, and the confidence restored to trade, would increase the volume of money, expand credit, and cause a rise of general prices.

A further increase of the world's money might be expected from the stimulus given to silver production by the rise in the gold-value of silver.

Per contra, the production of gold might slightly diminish, owing to the rise in general prices.

And though silver would have an increased gold-value, yet, as the value of gold in terms of commodities would fall, the value of silver in terms of commodities need not rise very considerably, in which case its production need not greatly increase.

The rise of general prices referred to above would be gradually checked by the expansion of trade, and the increased development of new countries which would result from the change.

Compare the effects which followed in consequence of the gold discoveries in 1848–50, and which falsified the predictions of Chevalier and others as to the probability of an extreme rise of prices.

Upon the whole we should be justified in expecting a considerable rise of general prices, and it seems at least absolutely certain that the fall now in progress would be arrested.

There are some who anticipate that a ratio of 20 to 1 would cause an injurious rise of prices. There are others who say that no increase of money would result from admitting silver to free mintage.

The view I have above expressed lies between these two extreme opinions.

3. *Effect on the Eastern Silver Valuations.*

The question now arises what would be the effect on general prices in the silver-using countries of the East?

The inertia of the Eastern valuations, sometimes described, in the case of India, as "the perversity of the rupee," is well known; and there are some who say that, just as there was no substantial rise in Indian prices up to the year 1893, though the ratio had fallen from 15½ to 1 to 24 to 1, so there would be no substantial fall in Indian prices if the ratio were to rise from 32 to 1 to 20 to 1.

Upon this I would remark that up to 1893, though the *gold-value* of silver altered in a very remarkable degree, there was no appreciable change in the *real value* of silver in Europe, and it was therefore natural that silver prices in India should remain undisturbed. But in 1893–4, when there was a further fall in India in the ratio, from 24 to 1 down to 34 to 1, the real value of silver in Europe fell for the first time, and there appears to have been a certain, though not a corresponding change, in Indian general prices, which have slightly risen.

This would seem to show that we may expect *some* movement of Indian prices when the *real value* of silver is altered, even if we do not get an *equivalent* movement.

Now there would, upon the whole, be a rise in the real value of silver if a ratio of 20 to 1 were established. Gold would fall in value to some extent, but the gold-value of silver would rise in greater degree, so that on balance the real value of silver would rise.

I should, therefore, expect a slight *fall* in general Indian prices, together with a greater *rise* in general prices in what were formerly gold-standard countries.

The two valuations would tend to meet one another; but the Oriental valuation, which has always shown the greatest inertia, would not come half way.

4. *Prices of Staple Commodities in the Trade with Silver Countries.*

Hitherto I have been speaking of the general scale of prices, alike in East and West.

I come now to the special case of those commodities whose supply is the subject of active competition between the two regions, such as wheat and yarns.

In the case of such commodities the movements and adjustments of price, though the same in nature and direction, would be of greater magnitude, just in the same way as their prices were more strongly disturbed

Prof. H. S. Foxwell. 15 June 1894.

when the ratio was falling from 15½ to 1 down to its present level.

In other words, I should expect that just as the gold-prices of wheat and yarns were exceptionally depressed during the fall of the ratio, so they would show an exceptional recovery when the ratio rose.

5. Inconvertible Paper Countries.

It only remains to consider the probable effect on prices in those countries which are now using inconvertible and generally much depreciated paper currencies.

The gold premium in such countries would, I think, tend to fall, for two reasons:—

The intensity of the scramble for gold would be lessened, and prices in what were formerly gold-standard countries would rise.

While then the gold price of exports from such inconvertible paper countries would rise, the paper price would fall.

It seems very probable that some of these countries, finding silver restored to its former position of equality with gold, and therefore perfectly effective as standard money, would gradually contract their paper issues, and finally resume cash payments upon a silver or a bi-metallic standard. Such a result is very much to be desired, and would be of the greatest advantage to the trade of the world, and to the trade of this country especially.

Prof. H. S. Foxwell. 15 June 1894.

6. The Transition.

In answering this question I have confined myself to the consideration of the results which might be expected to follow if a ratio of 20 to 1 were actually established.

I have not considered how the transition from the present market ratio of something like 33 to 1 to a ratio of 20 to 1 might be most conveniently effected.

I think it right, however, to add that I should personally be adverse to any *sudden* transition of this magnitude. As at present advised, I should prefer a *gradual* transition, such as might be secured by the adoption of the expedient commonly described as "the climbing ratio."

H. S. FOXWELL.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

For Professor Foxwell's further examination, *see* page 425.

Forty-sixth Day.

Thursday, 21st June 1894.

PRESENT:

The RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

Viscount COBHAM.
The Right Hon. Baron RENDEL.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., *Assistant Secretary.*

Mr. A. Hutcheson. 21 June 1894.

Mr. ANDREW HUTCHESON called and examined.

24,370. (*Lord Rendel.*) You are Vice-chairman of the Perth County Council, I believe?—Yes.

24,371. And tenant farmer at Beechwood, in Perthshire?—I live at Beechwood. I have two farms in Carse of Gowrie and one in Strathmore. I do not live on any of them.

24,372. Are your farms of considerable area?—About 900 acres.

24,373. Together?—Yes, altogether.

24,374. Of what character?—Two of them very stiff clay under Lord Kinnaird, in Carse of Gowrie, one a mixed arable farm on Lord Wharncliffe's estate, Forfarshire.

24,375. Are you near to Perth itself?—10 miles from it.

Rents.

24,376. Have you any opinion you desire to express to the Committee on the subject of rents?—From the farmers' point of view?

24,377. From the farmers' point of view?—Of course, in regard to the depression that is a very essential point. A fair rent, of course, is the main thing to some of these. If some of the farmers had been rent free I do not think it would have put them in a very independent position; but in the meantime, speaking for the present, in Scotland there is rather certainly more demand for land than there was five or six years ago when prices were perhaps 50 per cent. higher than they are to-day, for what reason I cannot very well explain, but that is the fact. There is rather more competition for land at present than there was. We have no derelict farms in Scotland; there is no difficulty just now in getting fair tenants to bid for land.

Mr. A. Hutcheson. 21 June 1894.

24,378. (*Chairman.*) Have the rents been reduced?—Yes; they vary considerably.

Reduction of rents.

24,379. What has been the average reduction?—Speaking roughly, I would say, in Carse of Gowrie, that the rents have been reduced 50 per cent. on strong clay land.

24,380. As much as that?—On strong lands; on the average black land I would think, perhaps, 25 per cent. I mean, when I say 50 per cent., on lands that are principally wheat and bean-growing soils.

24,381. You say there are plenty of offers now for land?—I do not say there are plenty, but factors and proprietors have a good choice of good tenants at a reduced rent—much more so than they had five or six years ago.

Tenants' capital.

24,382. Men with sufficient capital?—In some cases—that is one drawback, I think. Proprietors have sometimes been in the habit of taking large rents from non-practical men, and that exists to a certain extent yet, though not so much as it did some years ago; but a great many farmers enter on land with too little capital. We consider that on all arable land, at least, from 10*l.* to 12*l.* an acre of capital is required if you want to farm successfully.

24,383. What capital would you say these men are bringing in now?—I could not say exactly, but I know that a good many of them will try on much less than that.

Tenure.

24,384. Do they come in with leases?—Generally, but within this last few years there are breaks in a 19 years' lease, as a rule.

24,385. When is the break?—Every five or seven years, with a year or two years' notice.

24,386. With a break at the option of the tenant?—On both sides.

24,387. At all events, it is a lease good for five or seven years?—Yes.

24,388. Are there any cases of land being let from year to year?—Yes. I hold my largest farm in Forfarshire, about 500 acres, from Lord Wharncliffe, from year to year. I have held it for the past 10 years without any trouble.

Reduction of rents.

24,389. Is there a growing tendency in that direction?—No, I do not think so. I think the tendency at present is rather to take it on a lease.

24,390. In the case of subsisting leases, have the landlords made abatements?—In the majority of cases the landlords have dealt very fairly and honourably with the tenants.

24,391. Have they reduced the rent permanently during the lease?—Yes.

24,392. What kind of reductions have they made?—From 10 up to 30 or 40 per cent., according to the nature of the land.

24,393. Even as much as 40 per cent. would they?—Yes.

Purchase of farms by tenants.

24,394. Has the depression led to the breaking up of large estates?—Yes, there are a great many large estates which have been parcelled out and sold in farms; in fact, just now in Scotland, I think, land can be easier bought than rented; I mean to say, if a man can borrow so much and buy his farm, I believe he can sit at a less rent than if he rents it direct.

24,395. Have there been many cases in which tenants have bought the land?—A great many cases.

24,396. Have they provided part of the capital?—They must have provided part of the capital, but in most cases a good deal has been borrowed.

24,397. That, at all events, would indicate that many of the tenants have got money out of which they can buy?—When a man has been a long time on an estate, and his farm comes for sale he makes every endeavour that he can to get hold of money rather than leave the farm.

24,398. But he must produce, I suppose, a third or fourth?—He must either have that or get it from friends, and bond the rest.

24,399. Do you think that it is beneficial that there should be some occupying owners?—Yes, I do, and it is an encouragement to a man. When a place is his own he knows that every improvement that he makes he will reap all the benefit of, either himself or his family.

24,400. That is the highest form of security in fact?—The highest form of security.

Deterioration in cultivation.

24,401. Do you think that owing to the depression tenant farmers have spent less on the land?—Yes, I think that is one of the reasons; I think the land of Scotland is not nearly in so good heart as it was 15 or 20 years ago very much owing to the want of capital among farmers.

Land laid down to grass.

24,402. Has there been much change in the cultivation?—None, except that a good deal of land is being laid down to grass and to pasture.

24,403. What proportion of land do you suppose in your district was laid down to grass?—I should hardly venture to suppose. In speaking for Carse of Gowrie there has certainly been a third more land laid down. It is only within this last 20 years that it has been thought possible to graze strong land, but among the Carse of Gowrie properties I know one farm wholly laid down to grass which is doing remarkably well, and was let this year—I am not quite sure, but I think it was let at an average of about 3*l.* an acre. It was strong clay land.

24,404. It is let at 3*l.* an acre?—Yes, I think so. I think at or about 3*l.*, and there is a great deal of land being laid down to grass in the strong land.

Changes of tenancy.

24,405. Have there been many changes of tenancy?—No, not any abnormal changes, just the usual.

24,406. Do the tenants at the end of the 19 years' lease generally leave, or do they renew in your district?—As a rule, I should say they renew at reduced rents.

The letting of farms.

24,407. How is the land relet; is it put up for auction in any way?—As a rule the proprietor tries to deal with an outgoing tenant if he has been doing fairly to the land; if not he advertises. Personally, I consider it is a very bad thing to advertise a farm unless you advertise the sitting tenant out. I do not think it is fair to ask the sitting tenant to offer against the general public. I think the landlord should be free with him before he offers it to the general public.

Mr. A. Hutcheson.
21 June 1894.

24,408. Is that the general practice?—We sometimes find the sitting tenant is advertised out, and then when the bargain is made he gets it again. I have known instances of that.

Condition of labourers.

24,409. As regards the agricultural labourers, have they been affected by the depression?—No, I honestly do not think so. I think the agricultural labourer is in as good a position as any tradesman I know at present.

24,410. Have their wages been maintained?—Since I began farming in Scotland 25 years ago they have been very much increased; I think my average wages when I began would be about 22*l.* and 23*l.*, and they are at least 10*l.* a man higher since that time.

24,411. But compare with, say, 14 years ago before the depression began, I presume the rise took place previous to that?—Yes; I cannot charge my memory with 40 years ago, but I have often heard those who are interested in agriculture, and friends of my own, say that at one time they had there men at 10*l.* or 12*l.* a piece.

24,412. (*Mr. Giffen.*) That is with the addition of board?—Yes, with the addition of meal, and milk, free house, as a rule, and garden supply, potatoes, and perquisites of that sort.

24,413. (*Chairman.*) You were saying, looking back 25 years, wages had risen from 22*l.* to 32*l.* a year?—Yes.

24,414. I presume that rise took place within the first 10 years?—Principally in the seventies.

24,415. Comparing the present wages with what they were 14 years ago just before the depression began, have they been maintained or has there been any fall?—I think they are as high just now as ever they were.

24,416. Then, I suppose, the labourers benefited by the great fall of prices in food?—Yes, certainly their living is very much cheaper, but then they live on a higher scale.

24,417. They benefit to that extent?—Yes; of course they are quite entitled to live on a higher scale, but they do live on a higher scale.

24,418. Their money goes further?—Their money goes further, and I think they spend it more freely too.

24,419. How much do you think they benefit in that way?—By the reduction in the price of food?

24,420. Yes; taking generally the fall of prices in what the labourers consume, should you say that they have benefited to the extent of 20 or 25 per cent.?—I think surely they have. I was in the company of some gentlemen the other night who told me that a labourer in Scotland getting about 4*s.* a day, or something like that, could get as much bread as he could wheel away in a wheelbarrow, for his day's wage.

24,421. I wanted your opinion, if possible, as to what the per-centage of benefit is?—It is rather an intricate sum in arithmetic, but I am certain they must have benefited by the reduction in the price of all articles of living, but I could hardly condescend to a per-centage. It is rather an intricate question.

24,422. What are the conditions of the cottages in your district?—They are very good, and since the institution of the county councils, I think, as a rule, they have benefited very much in regard to sanitary improvements.

24,423. Are they generally let with the farms?—They are generally let with the farms. I do not think that any other way would be satisfactory. I do not think it would be satisfactory to the farmer not to have his cottages under his own control.

24,424. Are there gardens let with them?—Yes, generally good gardens as a rule.

24,425. Besides that, do labourers have potato grounds?—Yes, they have either liberty to plant so many in the field, or get a certain quantity.

24,426. What is generally allowed them in that respect?—Generally a good cartload, about a ton, just as they are lifted out of the field.

Mr. A. Hutcheson.
21 June 1894.

24,427. Has the labouring population decreased in that district?—Yes, certainly it has decreased more or less.

Rural depopulation.

24,428. In spite of the improvement in their position?—Yes.

24,429. How do you account for that?—Partly by the laying down of land to pasture which necessitates fewer of them, partly by the improved machinery—reapers and binders and things of that sort, and partly by the attractions of town life generally. Ploughmen are always inclined more or less to go to the large centres for employment in the way of carters and work of that sort.

24,430. Would you say that the supply and demand is about kept up?—We have by no means an oversupply of farm labourers.

24,431. Am I to understand that farmers can get what labour they want?—Yes, but I would say it was on the scarce side.

24,432. There is no surplus?—There is no surplus.

Statutory holidays for labourers.

24,433. Are you in favour of giving labourers reasonable holidays?—Yes, but not statutory holidays. I do not believe in statutory holidays in such an occupation as agriculture. Personally—I do not know whether I should speak personally here, but I give my men if they want it, at any rate, a week in the summer time, and a gratuity, but I am very much against them having statutory holidays, because agriculture is such a critical occupation that you may lose as much on a Saturday afternoon as would pay the whole year's wages.

Reduction of labour.

24,434. The farmers, I understand, have effected some economy in their labour bill by the reduced number of labourers?—I do not know on the wholly arable land whether they have or not, but where they have laid it down to pasture they have. If they are working it under the plough, I do not see how they can have effected it.

24,435. In consequence of laying down so much in grass they have effected an economy in their labour bill?—Yes, certainly.

Importation of Canadian cattle.

24,436. What have you to say with regard to the conditions under which the cattle trade is carried on?—Personally myself I was always a very successful feeder of Canadian cattle and in the east of Scotland (of course I am not talking here as Vice-Chairman of the Council—I am talking as a practical farmer), I know there is a division of opinion about it, but personally to myself and to many others engaged in the trade the stoppage of the Canadian stock trade has been a very great hardship indeed.

24,437. The stoppage of the free importation of lean cattle?—Yes. I have in my pocket here a cutting from the "Scotsman" of last week which shows in the Glasgow cattle market last week there was 2,050 of States and Canadian cattle for compulsory slaughter, which had had to be killed in 10 days and eaten in that time, in warm weather I suppose; and there was only 500 home cattle at market that week and they made a very dull sale.

24,438. (*Mr. Chaplin.*) How many of those were Canadians?—I cannot exactly say at present. It does not say here. It just says that the number of United States and Canadian cattle sold in market last week was about 2,050.

24,439. (*Chairman.*) Those were fat cattle, I suppose?—Fat cattle. It is that compulsory slaughter that kills the home feeder. I hold that there is no man in Scotland able to breed and feed cattle and send them to the centres of our population to compete with compulsory slaughtered States and Canadian cattle. Those cattle were sold on an average of 50*s.* a cwt. live weight, and I do not believe either a Scotch or English breeder can feed and breed cattle and send them to market and sell at those rates or anything approaching them.

24,440. The difficulty is that they are not allowed to import lean cattle?—Yes. The cattle still come in some shape or other, I suppose.

24,441. (*Mr. Clay.*) Do you mean 50*s.* live weight?—50*s.* dead weight.

24,442. (*Mr. Chaplin.*) You mean the order for compulsory slaughter makes the meat sell so much cheaper?—Yes.

24,443. (*Chairman.*) But that lowers the price of the fat cattle and therefore makes the competition more serious?—It just means this: that we have to compete with freshly killed beef in all the large centres of population. Of course these States and Canadian cattle can be killed this morning and be in the butcher's shops in the course of the day. They can be handled as quickly as our home cattle can be got and therefore we have got to compete with freshly killed beef.

Mr. A. Hutcheson.
21 June 1894.

24,444. You think that the lean cattle ought to be allowed in free?—Provided they are free of disease, and a number of us in Scotland, at any rate, are not satisfied that disease has been proved to exist in them.

24,445. In 1893 were many English and Irish lean cattle sold in Scotland?—A great many last autumn; a great many English cattle came north and a great many Irish cattle that would have supplied the farmers in the south of England also came north.

24,446. That, I suppose, was on account of the deficiency——?—The exceptional drought in the south of England.

24,447. You do not expect that to happen again?—I think it would be very unlikely to happen.

24,448. As a general rule you have in the past been dependent upon the Canadian lean stock?—A great number of feeders have been.

24,449. Or upon what you bred?—Yes. I would say personally that last year for want of Canadian cattle—I feed about 400 in a season—I would take from 2*l.* to 3*l.* at least less a head for my feeding stock than in the years when we had Canadian cattle.

Bimetallism.

24,450. I see in this memorandum you state you do not profess to understand bimetallism?—Well, for an ordinary Scotch tenant farmer it is a very abstruse question certainly, but I heard Mr. Chaplin in Edinburgh. I really think there is something in it.

24,451. Did Mr. Chaplin tell you that it would raise the price of wheat?—He said it would raise the price of wheat.

24,452. From 1*l.* to 2*l.* a quarter?—I do not know that he said that. He said it would certainly raise it, and I think it would have that effect—I agree with him. I think there is surely something in it.

24,453. If it had that effect you would be a bimetallist, I suppose?—Certainly.

24,454. But supposing it also had the effect of raising rent, labour, and everything all round, that would alter matters?—I would not personally grudge the proprietors a little more rent if it was possible to pay it. I think they are just as much in need of it as any class I know.

The Agricultural Holdings Act.

24,455. Then with regard to the Agricultural Holdings Act, what have you to say upon that?—I say that it embodies a valuable principle, but it is too expensive and cumbrous in its working. I have brought up a lease here I have of Lord Kinnaird in the Carse of Gowrie with a scale in it which I think very nearly a model scale.

24,456. When you say it is expensive and cumbrous, do you mean the way in which the arbitrator is brought in to decide the question?—I mean the lawyers and arbitrators eat up anything. I never saw a man make anything out of a claim under the Agricultural Holdings Act; he might win the day, but he was in reality a loser.

24,457. That was on account of the expense?—On account of the expense of working it.

24,458. It is not on account of the principle?—No; the principle is valuable.

24,459. Or of the scale, but on account of the expenses of calling in two arbitrators and the chief arbitrator?—In those cases it was not wrought by a scale at all; it was wrought by an arbitration. If a man has a scale, I do not see a need for arbitration at all, because if he produces his accounts and lays them on the table, he gets a certain proportion on account of what he has applied to the land. It is a matter of calculation.

24,460. Have you known instances where the case has been determined without arbitrators?—I have known them settled by scale.

24,461. Directly between the incoming and out-going tenant?—Yes.

24,462. When that is the case, do you consider the principle laid down by the Act is sound?—Yes; I certainly think it is sound. I think myself it is a valuable thing for a sitting tenant to have a claim

Mr. A. Hutcheson.
21 June 1894.

under the Agricultural Holdings Act, because if he has been working his farm well and keeping it up in condition and his lease falls out, his proprietor must naturally say, If I do not make a bargain with this man I have got to pay him his claim, and therefore he must get a certain preference. It prevents the proprietor putting his hand into his pocket, and in that way it operates to secure the farmer getting a renewal of his lease.

Scale of compensation.

24,463. Would you prefer some other scale of compensation to that laid down in the Act?—I prefer a definite scale in the lease. I prefer to work to a known scale. There is the scale in my lease on Lord Kinnaird's property, which I consider a fair scale to work to.

24,464. What is the principle?—"The tenant shall "be paid for the following improvements at the rates "and on the terms specified in this schedule: (1) For "lime applied to land, eight-tenths of the cost thereof "after the first crop has been taken, five-tenths after "the second crop, three-tenths after the third crop, "and one-tenth after the fourth crop: (2) For crushed "bones, bone dust, police manure, and other manures "of equivalent value, one half the cost where one crop "has been taken, and one-fourth where two crops have "been taken: (3) For dissolved bones, bone phosphate "and grain, one-fourth after the first crop has been "taken: (4) Feeding stuffs for linseed, cotton cakes, "or other substances of equal manurial value, which "have been consumed on the farm by cattle or sheep "during the last year of the lease, one-third of the "value thereof shall be paid, provided the quantity "shall not exceed the average of the preceding three "years." That is the only weak point I see in it. Personally, if I was preparing a model scale I would give a little more for feeding stuffs in the last year. I would provide for the second last year to be paid for also. Then my lease says further that I must produce vouchers, and prove that all these things have been applied to the land and paid for.

Restrictions on cultivation.

24,465. What is your opinion with regard to restrictions on cultivation?—I would hold that a farmer should be bound to work, according to the rules of good husbandry, and leave his farm in a certain rotation; but I do not believe in a farmer being bound down, as they are in some leases, to follow one crop with another with unwavering certainty, because seasons and one thing and another go against him that he cannot possibly do it.

24,466. Are the restrictions on leases in your district severe?—Personally, I never felt them severe. We sometimes sign what we should not sign, but there has been no hardship in working them in my experience.

24,467. If the restrictions are in leases have they been much observed?—They have not been observed to the detriment of the tenant as a rule. I have known cases of hardship, of course.

Price of straw.

24,468. Do you think there should be free sale of all produce?—Yes, provided the farmer keeps up the fertility of his land. For instance, in Dundee, which is my principal market, we have had a very strong demand for straw this year. I sold a lot of wheat straw myself at 4*l.* a ton. I think it would be the height of folly for a landlord to prohibit my selling that when it is only worth 10*s.* a ton manurial value to the land, provided I am bringing back what keeps up the manurial value of the soil.

24,469. What has been the general price in past years?—It ran up to 4*l.*, a pretty big price. About 3*l.*, I suppose, will be near an average.

24,470. Is that higher than it used to be?—It fluctuates very much according to the bulk of the crop and the foreign supply.

24,471. (*Mr. Lambert.*) Has straw been 3*l.* a ton, say on the average of the last seven years, excluding last year?—I do not think so taking the country all over, but in some centres where you have a big demand for it. The Lothians formerly sent straw to Dundee, but I suppose they will sell it at very much less than that. In the Lothians it would be 50*s.* I was in the Lothians the other day, and I believe they were selling straw at much under 4*l.* But taking a large centre like Dundee where there is great traffic in horse's keep you will always get a higher price.

24,472. (*Chairman.*) What did you get 14 or 15 years ago for your straw?—Not nearly so much as that at any rate.

24,473. How much?—About 2*l.* or 50*s.* at the very outside.

Mr. A. Hutcheson.
21 June 1894.

24,474. Then there has been an important rise in the value?—Yes. The straw of a good wheat crop at present price in Carse of Gowrie is worth a great deal more than the grain.

24,475. What do you grow on the average per acre of straw?—From a ton and a half to two tons is a good big crop.

24,476. (*Mr. Lambert.*) What per ton does it cost to put it on the market from the farm—say on the average?—I do not count much on that. I have got my men and horses there at any rate, and I dovetail it into the work some way or another.

24,477. Take the average of farmers—they might not be conveniently situated to the market?—I do not know—7*s.* or 8*s.* a ton.

Rates.

24,478. (*Chairman.*) Have the rates and taxes in your district increased?—Yes, certainly they have, but there are a number of new taxes of course, such as school rates and other rates, and since county councils taxes have increased. Whether we are getting an equivalent for it I do not know.

24,479. What do they average in the £?—It would be very difficult to strike an average. Some parishes are very light and other parishes uncommonly heavy again. I do not think I would venture to strike an average.

24,480. Can you give us an idea of what it is—the rates are divided between the landlord and tenant?—Yes, between the landlord and tenant as a rule.

24,481. What is about the amount the tenants pay—2*s.* in the £?—I would think that would be the full rate in most parishes. However, I was in one parish the other day looking at a farm, and it was nearly 2*s.* It all depends whether they are directly rural parishes or whether they include large villages or towns.

27,482. Taking your rent do you pay more in the pound than you used to do?—Yes; and then of course with the rents falling you have a less area to gather it off, and therefore the taxation must go up if you are going to get the same amount of money.

The Fertiliser's Act.

24,483. But the actual amount paid out of hand each year, is more than it used to be?—Yes, certainly more. Would you allow me to say one word on the Fertilizers Act? We have administered the Fertilizers Act, and with great success in Perthshire, both in the Carse of Gowrie Association and in the Strathearn Association, but I think there is one fatal blot on it; and that is that we have to furnish the chemist with the analysis of the manures from the seller before he makes his analysis. I do not think that is fair. I think the analytical chemist should give us his analysis with a free and open mind, and not know under what analysis the manure is sold. Also another amendment is that the analyses should all be made public. I think the Board of Agriculture might well spend money in making the analyses made under the Act public—printed at the end of a year, or something like that, because if one man gets a bad manure the seller will come to him and make it up to him, and keep his mouth quiet, whereas if it was published it would be a warning to the rest. I want to see that with regard to that Act.

Rent.

24,484. What are your remedies for the depression?—Of course, rent is the main consideration, and I am sorry to say that some of my farmer friends just now are to blame a little. I do not understand on what principle they are offering for land, because they are offering certainly larger rents than present prices warrant. I would have great sympathy with a man who took a farm too dear 10 or 15 years ago, and I think the proprietor was justified in helping the tenant through the bad times, but if a man takes land too dear just now I would let him hang into it, because he is taking it with his eyes open under circumstances which we see no prospect of being altered.

24,485. Then you would not interpose to prevent his doing that?—You cannot do it. The men have arrived at years of discretion, and they must be allowed to do it. I would have great sympathy with a man with a 19 years' lease taking land some time ago, but for a man taking land to-day with wheat at a guinea a quarter, and beef at the price it is, and potatoes unsaleable as they were last year, if he takes land too dear, under those circumstances he has only himself to blame.

Mr. A. Hutcheson.
21 June 1894.

Judicial rents.

24,486. You are not in favour of a judicial determination of rent in any way—where a man has agreed to give a rent that he should then be able to appeal to a court to say whether it was a fair rent or not?—I do not know—I cannot say that. I think a man should make his own bargain.

Land Courts.

24,487. Is there any movement in your district in favour of that?—Of a land court?

24,488. Yes?—I do not think so for fixing the price of land. I believe there is in regard to the Agricultural Holdings Act, of which we were speaking some time ago.

24,489. With regard to fixing the price of rent?—No, I do not think so.

24,490. Do you consider the burdens on land can be reduced?—I do not see how they can be well reduced, unless you shift them on to some other body's shoulders. As I said before the decrease in rent has made the burdens heavier on the rent that is now paid. Formerly we used to think in Scotland when land was about 3*l.*, and the farmer made three rents, he did well. Of course, three multiplied by three is nine, but when land comes to 1*l.* an acre, three times one is three, and the thing will not come at all

Agricultural education.

24,491. With regard to agricultural education, do you think more may be done in that way?—Yes. I was saying to Mr. Gilmour before we came into the room I would like to see a college in Scotland something on the lines of the Aspatria and other colleges you have in England where farmers' sons could get a good practical education, and at the same time get the science as well. We have nothing of that kind in Scotland unless they go to the colleges set apart for seats of learning, and of course they do not get the practical training there.

24,492. Then you think more may be done in that direction?—Yes, in Scotland. In England I think, as far as I know, the colleges are fairly well off.

Dairying.

24,493. Has the dairy farming in your district been affected to the same extent or not?—It is not a very large dairying district, at least there are dairies round the large towns, but, generally speaking, we do not dairy very extensively. Dundee, for instance, draws a very great deal of its supplies of milk from Dumfries nd Kircudbright brought by rail every day.

24,494. Has there been any co-operative dairying?—We have had it, and we have two or three dairy companies, but they have not been particularly successful ventures.

24,495. Why is that?—I do not know very well why it is. It is practically a new thing within this last few years, and milk is a very ticklish thing to handle. Of course these are limited liability companies I speak of. I have not seen much attempted in the way of farmers outside combining.

Land laid down to grass.

24,496. (*Sir Nigel Kingscote.*) Has the land which you say has been land down to grass and is now fetching 3*l.* an acre been laid down long?—Yes; it belongs to the proprietor, and he has laid it down very carefully, and intends to keep it down, I think.

24,497. How long has it been laid down?—Fifteen years.

24,498. As regards other land that has been what you call laid down, do I understand that it is actually laid down for permanent pasture, or do you keep your seeds down two or three years longer now so as to carry more stock on the farm?—It all depends on the nature of the land. On clay land the best practice, I think, is to lay it down and keep it down, and not to have a rotation at all on strong land; but on Strathmore lands I think it comes in best in rotation, allowing it to lie three or four years and then lift it.

24,499. Has the custom increased of keeping it down?—Yes.

Importation of Canadian cattle.

24,500. As regards Canadian cattle, do I understand you to say that you lose by not being able to obtain them because they fatten quicker than the home-grown cattle?—Yes, personally I have found them the healthiest cattle that ever I had.

24,501. The quickest to fatten?—The quickest to fatten.

24,502. And the cheapest to buy?—Yes.

Competition for farms and rise in prices.

24,503. (*Mr. Giffen.*) I think you told us that there is no difficulty in obtaining tenants for farms now?—Not in Scotland.

24,504. And good tenants?—No.

Mr. A. Hutcheson.
21 June 1894.

24,505. So that there is a good deal of competition really for farms; they can afford to pay the rent and make something out of it?—I cannot see how they can afford to pay the rents and make anything out of it either. I cannot account for it.

24,506. There is the fact of competition?—There is the fact. They think, perhaps, the times are at their worst, and then it is difficult to find an investment for money. I cannot account for it at all, because farms are let freer than they were when all produce was dear.

24,507. If the same state of things continued after a rise of prices, would the tenant farmers be any better off? If they continued that competition would it not put them back just exactly where they are now?—I do not quite understand.

24,508. Suppose prices of agricultural produce were to rise, and the tenant farmers were to continue this competition and go on bidding against each other for farms they would not be any better off at the end of it than they are now?—I think they would, because a matter of 4*s.* or 5*s.* an acre in rent is neither here nor there if you are getting good value for your produce. The rent is only one thing, and only a small thing now in comparison with other expenses.

24,509. I am assuming that competition goes on?—The foreign competition?

24,510. No, the competition for farms; if the tenants go on bidding against each other in that matter they would not be better off, surely, at the end of the competition than they are now?—They would not be as well off if they gave more rent. I do not exactly understand it, I must say.

24,511. If the tenants are competing now, and going into farms at prices that do not pay them, they might go on doing the same thing after the rise of prices?—Yes.

24,512. And then they would not be any better off than they are now?—No, if they were giving more for it.

Bimetallism.

24,513. Then with regard to a rise of prices, you are in favour of bimetallism, because it would bring about a rise of prices?—As far as I understand it, I honestly think it would have some effect in that way.

24,514. Would you be in favour of any monetary change of a similar character that would bring about a rise of prices?—I would be in favour of anything that would bring about a rise of prices.

24,515. Would not the simple way be for the Government to diminish the quantity of gold in the sovereign by one-third or one-half, and call the new piece a sovereign still; then you would have a rise of prices?—You are just going a little beyond my depth. I would be in favour of anything that would put us in a better position than we are at present certainly.

24,516. But you would not be in favour of a change of that kind, would you?—I would rather not express an opinion on that. It would need a little thought. It is just a little outside the province of a Scotch farmer.

24,517. Still, measures of that kind have been tried in former times for the purpose of raising prices?—I would rather not give a definite opinion on that in case I should commit myself to something I do not fairly understand.

24,518. You might be in favour of an extensive use of inconvertible paper money, which would also have the effect of raising prices?—I would rather have the gold than the paper money.

24,519. Would not giving you the proposed silver measure be something like giving you paper money and then calling it a rise of prices?—I state in the notes of my evidence that I do not understand bimetallism. I doubt you are going into the question of it, but I would rather not commit myself upon it.

The letting of farms.

24,520. (*Mr. Clay.*) I think you said that you did not agree with advertising farms?—Not before the sitting tenants have done with them. I think a landlord should be clearly done with his sitting tenant before he invites neighbours and others to offer against him.

24,521. Most of the landlords have followed that system of advertising their farms and taken the highest offer and their tenants have come sooner to grief than any others?—Yes.

Mr. A. Hutcheson. 21 June 1894.

24,522. So the landlord in the long run has been at a disadvantage?—Yes, the largest rent may tell for a year or two, but if the man is a non-practical man the proprietor virtually loses by the transaction.

24,523. When the Duke of Richmond and Gordon, who is one of the best landlords in Scotland, was giving evidence before this Commission, he said that he never advertised a farm and never allowed his land agent to conclude the contract until he went over the details and saw that it was satisfactory to both parties?—I think that is a satisfactory method.

24,524. Do you consider that if all landlords were to pursue the course of the Duke of Richmond they would be doing both better for themselves and better for the tenants?—Yes.

The Agricultural Holdings Act.

24,525. They with regard to the Agricultural Holdings Act you do not agree with the present process of getting compensation through that Act?—It is far too cumbersome and expensive. If you are to employ two arbitrators and an overman and a couple of agents they generally swallow up all.

Official referees.

24,526. Have you considered how it would work if there were one or two men in each county set aside to work that Act under the name of official referees?—I think it would be much preferable, either that or leaving it to the sheriff of the county to nominate a practical man to give a decision.

24,527. Would it not be as well if these men were nominated say by the Board of Agriculture?—Yes, I quite agree with that.

24,528. And so you would have no difficulty in getting two or three good men in Perthshire when called upon to discharge the duties of assessing the values?—Yes. I think it is much preferable, because the expenses are great. I have known two or three cases where the man gained his point under the Agricultural Holdings Act and lost money.

24,529. Do you consider that that would do away with all extra arbiters and lawyers?—I think so. I do not think they would be very often called on to operate, because both the landlord and the tenant would virtually know very nearly what a practical man's decision would be.

Scale of compensation.

24,530. Do you consider that scale that you have laid before us which is adopted by you and your landlord is under the Act what they call fair and reasonable?—Yes.

24,531. It allows eight years for lime. Does lime in your district last no longer than eight years in the land?—I think it does in clay land—on black land I do not know whether it does. I have seen the effects of liming clay land after twice eight years.

24,532. Would you be inclined to give the official referee a free hand to deal with the lime laid on, according to the qualities of the land?—According to the different nature of the land.

24,533. Then I think you took exception, and I think very wisely, that the weak point in that schedule in your lease is the question of the use of cakes?—Yes, I would give more encouragement for the use of cakes, I think you bring land more rapidly into condition with the free use of cake than by importing a great lot of what we call in Scotland town manure.

24,534. Would the free use of cake not make good grass or conditioned land quicker than any other manure?—I think so.

24,535. Would you be inclined to go a little further with the use of cake?—Yes.

24,536. How much further would you say the second year?—I put it something on the scale on which manure is put; give a fourth for the second last year say, and a third for the last, or something like that.

24,537. Does the landlord allow you anything for laying down old grass and leaving it in your lease?—No; in this instance I did lay down some land to grass and my proprietor was to meet me in three years, and either take it off my hand or allow me to break it up again, but instead of doing either one or the other we went into a new lease.

24,538. Do you not think it is very important that an outgoing tenant should be compensated very liberally for leaving old grass?—Yes, certainly. That is the great difficulty in laying down land to grass, unless the tenant is compensated. By the time it is well laid down it is just about time that the tenant should lift it again to prepare for the finish of his lease.

Mr. A. Hutcheson. 21 June 1894.

24,539. If he got compensation then he would not lift it?—No, he would not.

24,540. And you consider that to be a very important point in the Agricultural Holdings Act?—Yes, a very important point.

The Fertilisers Act.

24,541. Regarding this new Fertilizing Act, I think that in your old societies such as we have—the Kelso Society which is of 40 years' standing—everything there is made private to the members of that Association, and you consider it is a very weak point in this Act that the farmers generally have not the opportunity of seeing what is good or bad according to the analysis?—Certainly, it only protects the man that sends in the manures for analysis; it does not protect the general farming interest.

24,542. You also consider that it is not a fair way of working that Act to give the chemist the seller's analysis?—I do not. I think a chemist should make the analysis of his own free will and not know what the seller's analysis is until he renders his own.

Competition for farms.

24,543. Do you consider with respect to the land hunger near Dalkeith and other places round Edinburgh that the present prices of agricultural produce do not warrant these extreme high rents?—Yes, and I think every sane man will agree with me. They may see something in the future that we do not see.

24,544. How do you account for that extra competition?—I account for it in two or three ways; one is that agriculture in America and other countries—of course it is only hearsay—is so bad that farmers' sons are more inclined to stay at home perhaps; another reason is that when things are at their worst people always expect them to mend, as we say in Scotland. I think there is an idea abroad that things are at their lowest. Another reason is that a number of men are still taking farms with the idea that they are taking them under liberal landlords who will not see them stick; that has been a good deal the case in the past. Then there is also the difficulty of getting a remunerative investment for money. There has been so much capital lost outside in other countries lately. People say they would rather have it under their own management, although they make little or nothing of it.

24,545. Taking the whole range of prices and the competition from all parts, do you see anything to warrant any increase of price?—No.

Cost of labour.

24,546. Later the price of labour may tell against us still?—Personally, I do not want to see labour reduced. I think the labourer is worthy of his hire, and I do not see how we can expect to get agricultural labour for less.

24,547. I agree with you that the labourer has never yet got his fair share of the produce of the soil, but is it not on the cards that he may yet increase in value?—I think so.

Position of landlords and tenants.

24,548. In that case there will be both less for the landlord and less for the tenant?—The tenant cannot have much less at any rate. I cannot judge of the proprietor's position, because I have never been in it. I know that in Scotland there could not be less money return from the land than there was on an average last year.

24,549. (*Mr. Everett.*) You had a very fine season last year, had you not?—Yes, we had a very fine season, but then we have had extraordinarily low prices, especially for the wheat and the potato crop. The potato crop alone on many farms has been marketed at you might say a fourth or a fifth of its ordinary value.

24,550. (*Mr. Clay.*) I think you said the landlords as well as the tenants, the landlords more especially, require an increase?—Well, I think so. I cannot speak from their standpoint, but I know that when land comes down to 1*l.* an acre, or such as it is with us in the Carse of Gowrie, after the landlord pays taxes and other burdens and keeps up the lands and the buildings and everything else, he cannot have very much over.

Agricultural education.

24,551. Regarding that very important matter which you commented upon, the agricultural colleges, as I understand you consider that in Scotland our middle class agriculturalists are greatly in want of means for getting technical education relating to the management of land?—I think it is a very strange thing that

Mr. A. Hutcheson. 21 June 1894.

in Scotland, (and everybody acknowledges—I suppose the gentlemen around the table do—that Scotland has advanced further educationally than England,) we need to send our sons across the border to get them perfected in agricultural education.

24,552. At Cirencester and other places it is too high a class—too expensive?—Yes, Cirencester is a very good college, but there is hardly any average farmer that is able to send his sons there.

24,553. You would like to see a college in Scotland?—I would like to see a college in Scotland—a good agricultural centre where you could get an education at a reasonable cost; where the farmers' sons and others could get an education in the college, and could go round the farms in the afternoon as they do in some of the English colleges, and see how to put their hand to practical work.

24,554. Would you like to see a little land connected with the college, although it did not pay full rent, as they have at Cirencester?—I have no experience of it, but I am told at Cirencester they had to let the land. I am quite agreeable to that if that is thought the better way, but I think it is a great pity that we have not in Scotland a good agricultural college where young men could go at a moderate fee.

24,555. But you could only learn the practical part of farming by putting out your hand and working the land?—Yes, certainly.

25,556. Not by a theoretical course of lectures and books?—You must have theory too, but it will not do without practice.

24,557. Not on the ground that theory is not very good in itself, but that a practical knowledge is wanted?—It is the main thing, of course. We have had many capital farmers that have never had much theory at all.

24,558. (*Mr. Lambert.*) If there was a demand for such a college in Scotland, would it not be started by private enterprise?—I do not know. I am afraid it might not be a very paying concern perhaps to begin with. I have heard it mooted often. My idea of it was that the various county councils in Scotland might give a small portion of the technical education grant, and establish a central college.

24,559. They would be able to do that if they thought there was a sufficient demand?—I have no doubt there would be a demand.

24,560. (*Mr. Gilmour.*) Of course, these grants from the county councils would not be sufficient to start and establish a college?—No.

24,561. They might help to carry it on?—If every county council were to give a little out of the Technical Education Grant in Scotland, it would come to a good annual subsidy.

24,562. They might contribute enough to enable them to send men from the different counties to attend at reduced fees?—Yes.

24,563. But in the first place, you would require to have either Government assistance or private individuals to come forward, and give money for it, I take it?—Yes.

The letting of farms.

24,564. Is it not a very unusual thing in your part of the country for landlords to advertise farms, until they have failed to come to any conclusion with their tenant?—It is an unusual thing, but I have known cases of tenants getting their farms after the landlords have gone to the public, when they could not get a larger rent. It is unusual, I admit, and I do not think it is a fair system.

24,565. Is it possible there could be any better way of getting a tenant for a farm, than placing it openly before the public through an advertisement, as we do in Scotland?—I do not know. I have a proprietor in my mind in Forfarshire, who never advertises his land at all, and he has as many offers and as good men as the man who does advertise a good deal.

24,566. The plan that has been followed by the Duke of Richmond in letting his farms has been referred to by Mr. Clay as being a model way, but would that be a practical way upon ordinary sized estates, where you have very few tenants' families to fall back on? As I understood from the Duke of Richmond, he generally lets to other tenants or sons of tenants upon his large estates, and where you are carrying on an estate of a certain size that may be possible, but taking ordinary properties in Fife and in Perth, would that be practicable?—You mean to say the tenants would not have sufficient sons to come forward and take them.

Mr. A. Hutcheson. 21 June 1894.

24,567. Quite so?—It would be much easier on a larger estate, for then you would have a much larger choice.

24,568. But on ordinary sized estates, would it not be, in fact, impossible to get tenants in any other way than by advertising?—I do not think it would be impossible, but I think it is quite a fair way to advertise if you are perfectly done with the sitting tenant.

Large and small farms compared.

24,569. Has the depression been felt worse on large or on small farms in Perthshire?—I think the depression is very nearly alike on them both, but in regard to small farms, of course, where people do the labour within their own family they perhaps have not actually felt it so much as the larger farmers, who have to pay wages direct out of pocket.

Small Holdings Act.

24,570. Has the County Council in Perth done anything in the way of putting the Small Holdings Act into operation?—No, there has never been any application.

24,571. No application for it?—Lord Kinnaird, whose lease I have quoted, has done a good deal personally; he has divided up two or three farms, and has got them let readily, I understand.

Malt tax.

24,572. Has there been much opinion expressed in your part of the country as regards the repeal of the Malt Tax and its effect upon the price of barley?—Yes; farmers, as a rule, think that the repeal of the Malt Tax was a mistake.

24,573. What do you put the effect of that repeal at as against the price of barley?—There are so many other substances—foreign grain, and that—which can be brought into competition with our barley, that it is difficult to say.

24,574. How much do you consider barley has fallen owing to that; can you separate that from other causes?—I certainly think it has operated against the price of barley, but I would not like to condescend on a sum; it would be difficult.

Restrictions on cultivation.

24,575. There seem to be a good many in your part of the country who have been perfectly free to crop their land as they chose, and also to sell off what they chose; are those men practically in a much better condition, or any better condition, than those who have been under the ordinary lease?—I know very few men who are in a position of being able to do that.

24,576. Very few men round about Perth?—Very few tenants.

24,577. But you have men who own their own lands and farm them; are those men in any better position?—Yes; I think that if a man can sell a certain class of produce at a biggish price, and if he can make up the condition of his land by importing something cheaper, certainly that would be a great advantage.

The Agricultural Holdings Act. Claims and counter-claims.

24,578. Have you considered the mode of giving the notices of claim and counterclaim under the Agricultural Holdings Act?—Yes, I have considered it, but I cannot say that I have been personally much concerned with it in practice. I have never had to put it into operation. You mean that the landlord can put in his claim so long after the tenant?

24,579. Yes?—I think myself that I would put them both on the same footing.

24,580. And have both notices put in at the same time?—I think so; I think it gives the landlord rather an advantage in the way it is at present.

24,581. Have you anything to say in regard to the schedules attached to that Act, as to removing items out of one schedule into another?—No, I cannot say that I have.

Restrictions on cultivation.

24,582. Supposing these conditions which are inserted in certain leases as regards cropping were done away with, do you think that that would practically alter the mode of farming in your district to any extent?—I do not know whether it would, but there is one thing I would take out of the lease if I had the power, and that is the penal clauses of 5*l.* an acre for miscropping. I I would never sign those clauses; I have always said to the landlord, "I am quite willing to be fined for mis-"cropping, but let it go to arbitration as a damage to "the land, and not let it be a penal rent." I have known one or two cases of extreme hardship where it has been a penal rent.

Mr. A. Hutcheson.
21 June 1894.

24,583. Where leases obtain would it be sufficient, in your opinion, to stipulate that the land was to be left in a certain rotation at the end of the lease?—Yes, and farmed according to the rules of good husbandry. I would be as hard on a farmer for misusing his land as I would be on a proprietor for any fault on his part.

24,584. The question of leaving it in a dirty state with weeds would be a matter to be decided at the time before the umpire?—Yes, and the umpire, as Mr. Clay proposes, if he were a really practical man, could quite as well tell from the appearance of the land how the tenant had been handling it.

Income tax.

24,585. It has been proposed that there might be some alteration in the way in which farmers are assessed for their income tax in Scotland; that instead of being assessed on a third of the rent they should be assessed on profits?—It is generally supposed that they have no income at all for a number of years.

24,586. Would it be possible for the general run of farmers to produce accounts on which statements of that kind could be taken?—I must say that I could do it myself, but I do not think it obtains universally.

Compensation for home-grown produce.

24,587. Have you thought about any practical means of carrying out the proposal that compensation should be given for home-grown produce consumed on the farm?—Yes, I certainly have thought about that over and over again. It is a question which is surrounded with a great deal of difficulty. It seems a very strange thing that, say, if I am feeding hogs in winter, I have to go and sell my own corn and buy my neighbour's before I can substantiate a claim. It is a question that is certainly not very easily settled, and I do not know very well how the figure could be arrived at, because you would have no accounts for the home-grown produce. In the case of bought-in material you can produce your receipted account. Certainly if there could be a scheme devised it would be an advantage.

Scheduling the condition of farms.

24,588. It has been proposed that there should be almost an inventory taken at the beginning of the lease of the state that every field was in upon a man's farm, and that this should be kept to be the basis of acting with that man on his leaving the farm?—I think that is too intricate, and I do not see how it could be done.

Payment of labourers in kind.

24,589. (*Mr. Chaplin.*) With regard to the agricultural labourers in your part of the county are they ever paid in kind?—Yes; we give so much money, and supply meal and milk and potatoes, free house and garden.

24,590. What proportion of their total wages does that represent; how much, that is to say, do they have in money, and how much in kind; which is the larger share of their earnings?—The money; personally I consider that it is a very valuable thing that a ploughman in Scotland can have a supply of pure milk and meal and potatoes also. I think it would be a retrograde step to pay them all in money.

24,591. You cannot give us any idea what proportion of the whole wage it represents?—I would think myself that the money wage would come to something like 33*l.* or 34*l.* a year for an average ordinary man without charge, and I would suppose that his perquisites (I speak, of course, under correction) would bring him up to something like 1*l.* a week.

24,592. That would be about 19*l.* a year that he would get in perquisites?—Something like that.

24,593. And 33*l.* a year in wages?—Yes. There is one thing I want to emphasize here. I know that some people are not in favour of paying in kind. Now take a farmer like myself, and there are a number of farmers in the same position; if I had not to supply milk to my men it would be a great advantage, because I should not keep cows at all, but then the labourers would have to wander all over the country in order to get a supply, and perhaps could not get it near at hand at all. I think it would be a disadvantage to the men.

Importation of Canadian cattle.

24,594. With regard to the trade in Canadian cattle, how long have you been engaged in that trade; it is comparatively modern, is it not?—It has existed, more or less, since early in the seventies—1876, was it not?

24,595. Has it existed so long as that?—I think so; you know better than I do, probably.

24,596. Can you remember when you first bought Canadian cattle?—No, I could not charge my memory with that, but I was among the first to buy them.

24,597. It began in a very small way, and since then has developed very considerably?—Yes.

Mr. A. Hutcheson
21 June 1894.

24,598. What did you do before that trade began; where did you buy your stores then?—We bought either home bred or Irish cattle—anything that we could get in that way.

24,599. Had you any difficulty in those days in getting a sufficient supply of store cattle?—Yes, we had more or less difficulty, and we certainly had to pay pretty sweetly for them.

24,600. Now I observe that you say that, in the course of time, breeders also will be affected by the present embargo upon Canadian cattle?—Yes.

24,601. How will that come about; I do not quite understand that?—My contention is this, that if we in Scotland and England are all forced into breeding cattle, then, of necessity, we must breed them against the Canadian and States importation of fat cattle. If we do not get them as stores, we will get them as fat cattle, and we shall have to send our home-bred cattle to meet, in the market, those compulsorily slaughtered cattle, at something like their own prices. Now, I hold, that we cannot, in the East of Scotland, send home bred and fed cattle to Glasgow to meet this importation I have spoken of, at 50*s.* per cwt.

24,602. Then you are of the opinion that this will ultimately injure the breeder as well as the feeder of cattle in Great Britain?—Most decidedly, in the case of ordinary commercial cattle, at any rate. My idea is that we shall produce between us all over the world, more fat beef, and therefore reduce the price.

24,603. Is not the store stock in Ireland, as far as you are aware, greatly increasing at present?—I cannot say whether it is increasing or not, but certainly at the present time the price of store stock is out of proportion to the price of the finished article.

24,604. Has there been an increase in the price of stores lately?—In Scotland there has been, locally—at least, I am speaking *pro tempore*—a decrease, but that has been brought about by the state of the weather. I am speaking of this spring, when we got this hard frost. Then store cattle came down.

24,605. But the wet summer we have had, generally speaking, has rather tended to increase the price of stores; is that not so?—Stores were dearer with us early in the season than they are now in Scotland.

24,606. And that you attribute to the recent frost?—Yes, the pasture did not stand what we call eating.

24,607. Is there not room for considerable development in the breeding of cattle in Scotland?—Yes, there is room for it; but there are a great number of districts in Scotland where we would need to go to a great deal of expense before we could begin to breed cattle; there are difficulties in the shape of unfenced land, and that sort of thing.

24,608. I am quite aware that in some districts in Scotland, and perhaps one or two in England, there is a great feeling in favour of the importation of these Canadian cattle free, provided it can be done without risk of disease; is that so?—Yes.

24,609. But that feeling is limited, as far as I know, to those districts I have mentioned; what is the reason you are more in favour of it in Scotland than farmers are in England?—Because we are more long headed, and see before us better.

24,610. That is a reason which I cannot dispute for a moment; you think other farmers will come to be of the same opinion?—Yes; I hold that if the store cattle trade had gone on in Canadian cattle for another seven or eight years, no power on earth could have stopped it unless you had given us clear proof of the existenco of disease.

24,611. I understand from what you say on that point, that you would rather have the embargo maintained as it is now, than run any serious risk of the return of disease?—Certainly; I think we are all agreed on that.

The Agricultural Holdings Act.

24,612. Now with regard to the Agricultural Holdings Act, I understood you to say that you think compensation ought to be given rather on the principle of the outlay being made the basis than of the value to the incoming tenant; did I understand you rightly there?—I think that the outlay is the fairest way of arriving at it.

24,613. Your view is this: that in the case of a tenant who has spent so much we will say upon cake, and so

Mr. A. Hutcheson.
21 June 1894.

much upon artificial manure, at the end of his tenancy, when he quits, he should be repaid a certain proportion of that outlay?—Yes.

Official referees.

24,614. That is your view?—That is my view. I am quite in favour of Mr. Clay's view; working it out in his way, and having an arbitrator appointed by the Board of Agriculture in various counties, to decide the claim. We must have it simplified in some way, at any rate; the present working of it is too cumbersome.

24,615. Upon that point would you make it obligatory to employ this official valuer, and would you forbid people, even if they wished to do so, appointing their own?—If the Board of Agriculture exercises due care regarding the valuator, as I have seen it done in the past with regard to other things, I do not think there will be a question.

24,616. I asked the question of you because some witnesses here have given evidence to this effect, that they would prefer to be allowed to appoint their own valuers; there is a great deal of difference of opinion about it; would you go so far yourself as to prohibit the appointment of valuers by the parties concerned? I only want to know what you think?—The Government arbitrator would be supposed to be a man who would approach it from both sides of the question. Unfortunately in these arbitrations one man goes for the one side and the other man goes for the other side, and it is generally left to the oversman; they very seldom agree.

24,617. You commonly have differences in valuations in Scotland then?—I say valuators generally go for it upon the principle of the man who employs them.

Compensation for land laid down to grass.

24,618. Now with regard to the permanent grass which you have laid down upon the farm, which you hold upon a lease; what is the compensation that you think ought to be given in that case? You would, I suppose, give a certain proportion of the outlay, in accordance with the number of years which have elapsed since it was laid down?—Yes, and then if I enter a farm of 100 acres and lay it all down in grass, I would have the right, as a way going tenant, to sell the produce of that ground at a way going sale; and I would need to be remunerated by my proprietor for the loss of that sale, and for leaving the land in grass.

24,619. I understood you rather to say that your difficulty was that in the absence of that compensation you found it to pay better to break up the grass again before you arrived at the end of your lease?—Of course I would if I had the right to sell a crop off it. It would never do for me to lay down land to permanent pasture, and then leave it to my proprietor gratis; I would not do that.

24,620. What compensation would pay you in your opinion for leaving it as permanent grass for your successor?—If I were getting the benefit for grazing it, as I would do up to the end of my lease, it would come to be a matter of what was the difference of leaving this land in grass, and selling a way-going crop of grain upon it.

24,621. (*Chairman.*) How long before leaving your farm would you break it up?—You would need to break it up two or three years before.

24,622. It takes two or three years to obtain the value that you put into it?—Yes, and also to bring it into a proper rotation.

Reduction of rents.

24,623. (*Mr. Chaplin.*) Now, with regard to the rent which you say is the main consideration; rents have been, I understand, considerably reduced already?—Yes.

24,624. Are there any parts in your district where it has got so bad as this, that no rent is paid?—No, and never will be in Scotland.

Land out of cultivation.

24,625. And there is no land out of cultivation?—No, and I never anticipate to see that time.

24,626. The land is too good?—No, we manage it better than that. We never need to throw it up as a bad job. I do not think it will ever come to that in Scotland.

24,627. Has it nothing to do with the quality of the land?—Partly that, and partly the brains of the cultivators.

Average rent.

24,628. What is the average rent now in your district?—I think the average rent of the Carse of Gowrie will be from 15*s.*—that will be the very lowest that I know of; and that is not what we call good land at all—up to 25*s.* and in some cases 30*s.*, but a pound to 25*s.* will be the average in the Carse of Gowrie.

24,629. Even now?—Now. I have taken a 19 years' lease myself of land at a moderate rent.

Mr. A. Hutcheson.
21 June 1894.

24,630. (*Chairman.*) When did you do that?—I did that the other day with Lord Kinnaird.

24,631. How much?—380 acres.

24,632. (*Mr. Everett.*) With breaks in the lease, I suppose?—No, I took no breaks.

24,633. (*Mr. Chaplin.*) What reduction does that amount to? What used that class of land to let for 15 years ago, or say 20 years ago?—It used very often to be on what we call a grain rent at that time; that is, so many bushels of grain at the average prices of the county. I suppose at the time you allude to, that land would let at from 50*s.* to 3*l.*

24,634. Then there has been a heavy reduction?—Yes.

24,635. Then in the case of all the land which was worth only a pound an acre, at that time that you speak of, when your farm used to let for 3*l.*, I suppose you might conceive it possible that that class of land might have gone out of cultivation?—Yes, but we had none of that class of land at that time.

24,636. Then the quality of the land has something to do with it?—Certainly.

24,637. Farming used in those days to be very prosperous indeed in Scotland, did it not?—Yes.

24,638. Even at the time when you paid those high rents?—Yes, in fact I would rather pay a higher rent and have the prices for produce we had at that time, than I would pay the lower rent now.

Fall in prices.

24,639. What is it that has occurred to bring about this tremendous change?—The fall in the prices of produce.

24,640. The real cause of agricultural depression after all then, is the great fall in the prices of agricultural produce?—That is the main factor.

24,641. Do you see any other real remedy, unless there should be a rise?—Reduction of rent, for one thing.

24,642. (*Chairman.*) There is still some rent that might be further reduced?—Yes. Then there is this vexed question of bimetallism; I honestly think there is something in it, although I would not attempt to say what it is.

24,643. (*Mr. Chaplin.*) At all events, you do not believe in the suggestion that has been made to you, that a rise in the price of produce would do you no good, because the other things would all rise in proportion?—I do not know; it would do me good personally, now that I have got a bargain made.

24,644. (*Chairman.*) You are safe for 19 years?—Yes.

24,645. Your rent could not be raised during that time?—No, it would do me good there, I can see through that quite well.

24,646. (*Mr. Chaplin.*) You look back to the days of 3*l.* an acre, with better prices, as a prosperous period?—Yes, everyone was better at that time than now.

24,647. Would you like to see that state of things return?—There is a good deal in the last part of the notes of my evidence with regard to our trade with other countries; if we can get them converted to a free trade policy, I think that would be a great advantage.

Duty on potatoes in America.

24,648. Do you see any prospect of that at present?—I think they will see the error of their ways themselves. Fancy the United States taking 39*s.* 8*d.* a ton duty on potatoes, the real worth of the article itself at present.

24,649. (*Chairman.*) Would there be a large exportation of potatoes from Scotland if it were free?—If it had not been for the American demand for potatoes this year, the crops would have been worth little, if anything.

24,650. If there was no duty on potatoes in America, there would be a still greater exportation?—Yes, and the American people would feed themselves much cheaper; they are great fools, I think, from their own point of view.

Dairying.

24,651. (*Mr. Chaplin.*) Is there, in your opinion, any considerable opening for an extension in dairy farming in your part of Scotland or in any parts of Scotland that you are well acquainted with?—Yes, there is great room for the extension of dairying.

Mr. A. Hutcheson.
21 June 1894.

Dairying.

24,652. Dairy farmers, I understand, have suffered less than almost any other kind of farmers?—Yes; but the district I come from, the east of Scotland, is not so well adapted for dairying as the south and west counties of Scotland. I do not know how it is, the habitation of dairying seems to be in Dumfries; you see railway rates operate there. I understand that the railways bring the milk from Dumfries to Dundee, I would not like to say at what rate exactly, but I think there is just a farthing a gallon difference between putting it on at Dumfries and putting it on within 20 miles of Dundee.

24,653. What I am anxious to get at is this: In cases where depression still continues very badly, and where there is a prospect of its getting even worse, as far as your practical experience of farming in Scotland goes, would you think that anything could be done to mitigate that depression by increasing dairy farming very largely, and making it take the place of other farming in Scotland?—To a certain extent it might, but we might have severe competition in the dairying industry as well as in any other. Just now, in Dundee, they are pouring in the very best Danish butter at 1*s.* a pound.

24,654. Is that not because the Danish butter as a rule is better than the butter we make in this country?—Perhaps it is, but if we made as much butter as we needed, and did not get much more than 1*s.* a pound for it, it would not be a tremendously remunerative occupation.

24,655. That rather leads to the view that there is no great opening for an extension of dairy farming?—It is quite possible to overdo it.

24,656. Do you think that the market is pretty well supplied already?—I think the competition in dairying is as severe as in almost any other industry; of course, near large towns, where they can get away their milk warm, it is quite different, but I do not know about the manufactured dairy products.

24,657. If we made as good butter in all respects as Danish butter; if agricultural education was improved to that extent, and the class of butter was made very much better than it is now, you do not see any considerable opening even then?—As long as the Danes would send in their butter at 1*s.* a pound we should be obliged to meet them.

Compensation for home-grown produce.

24,658. I only want to ask one question more that occurs to me; that is, with regard to home-grown produce being compensated for; your difficulty evidently is that there can be no check, or that there is no check at present upon fraud?—I do not think my class, as a rule, would attempt any fraud, but I am afraid that they deal too loosely in that matter. It would be difficult to keep a correct account of what was consumed on a holding. I do not think that many of them would, out of evil intent, try to do what was wrong, but it would need very careful accounting.

24,659. The same difficulty, I am bound to say, has been put before us by a great number of other witnesses, and you are not prepared to place before us a scheme which would overcome those difficulties?—I have not thought out a scheme. Of course, it would be valuable if it could be done, but it is surrounded with a great deal of difficulty.

Division of large estates.

24,660. (*Mr. Lambert.*) Do you regard the ownership of the land as beneficial to the occupier? Is the owner in a better position than the tenant farmer?—I have never been in the position of owner, but I can quite well understand that a man who owns 100 or 200 acres gets the benefit of all the improvements, and farms for the benefit of his heirs.

24,661. Are you in favour of any legislation which would tend to break up large estates and enable the land to be more easily distributed?—Yes.

Bi-metallism.

24,662. You say that you are in favour of bimetallism because you imagine that it would raise wheat 1*l.* or 2*l.* per quarter?—That is what I am told.

24,663. Would there not be a simpler remedy, that is, to put on an import duty at the ports to that extent?—You could not do that at this time of day, the general public would rise up in arms against you.

24,664. What is the difference; would not the general public rise up in arms against you if you raised the price of wheat by artificial legislation 1*l.* to 2*l.* a quarter?—I do not know whether bimetallists call it artificial, they seem to think it is natural.

24,665. Do you not think whether it was by artificial or natural means, the general public would rise in arms if you intended to raise the price of wheat from 1*l.* to 2*l.* a quarter?—If you raise the price of wheat by natural means I do not see that anybody has a right to object.

Mr. A. Hutcheson.
21 June 1894.

Importation of Canadian cattle.

24,666. What is the tendency as regards prices at the present moment of the restrictions on the landing of Canadian cattle?—The tendency is to keep down the price of home-produced fat cattle.

24,667. Does it raise the price of stores?—Yes, it raises the price of stores by limiting the number of them, certainly.

24,668. Are you in favour of lowering the price of stores?—I am in favour of having a natural price for stores at any rate, and not a fictitious one. I hold that the importation of Canadian cattle would not affect the home breeder to the extent that people imagine. The large number of us farmers who have already bought these cattle will continue to buy them, if they are imported, but if you do not give them to us we will breed, and we will enter into competition with our farmers who are breeding. We should be bound to breed in self-defence. Feeders are not going to give absurd prices for store cattle out of all proportion to fat, and if you stop the importation we will have to start and breed ourselves, every one of us.

24,669. Do you think that the free importation of Canadian store cattle would tend to reduce the price of stores?—In this country?

24,670. In Scotland?—I do not say that it would have that effect altogether, because it would keep those of us who are feeders, otherwise we must turn breeders.

The Agricultural Holdings Act.

24,671. Have you studied the question of compensation under the Agricultural Holdings Act?—Yes.

Compensation.

24,672. I rather gathered just now that you were in favour of compensation being awarded, not upon the value of the holding, but upon the outlay of the farmer?—The outlay of the farmer and the value of the holding must be in a certain ratio.

24,673. Presuming that one farmer had laid out 100*l.*, and had laid it out beneficially, and that it was worth 150*l.* to the holding, and presuming that another man had laid out 100*l.* likewise, and that it was only worth 50*l.* to the holding, how would you award the compensation in each case?—I was only speaking of manures and feeding stuffs, of course; I was not applying any other improvement except those that are specified in the schedules.

24,674. How could you estimate the compensation in that case; would you estimate it upon the value to the holding or upon the outlay?—If one man eats 100*l.* worth of cake, and another man eats 100*l.* worth of cake, there would be the same value to the holding.

24,675. I am talking of other improvements?—I did not enter into anything except that scale for manures and cakes and feeding stuffs. Of course what you speak of now would fall more under what Mr. Clay suggests, the decision of an arbiter. I quite acknowledge that a man might go and execute an improvement on the farm which was not for its permanent benefit. He might go and erect a byre or stable; he might possibly, out of some fad of his own, go and erect something that was of no use. I would not compensate him for that.

Security of tenure.

24,676. You attach a good deal of importance to long leases, do you not?—Long leases have made agriculture in Scotland what it is at the present time.

24,677. For what reason have they made it so?—Because of the greater security of tenure.

24,678. You attach very great importance to the security of tenure then?—Yes; a number of years ago, when you could count on a sort of fixed value; but in these days of rapid changes I do not know that the 19 years' leases are the best.

24,679. But presuming that the conditions were the same at the commencement of the tenancy as they are at the end?—Certainly, the leases are preferred in Scotland.

24,680. And they conduce to the fertility of the soil?—They have done so.

Railway rates.

24,681. You state in your brief that railway rates are most unfair; have you any specific instances to bring before us?—I cannot condescend to specific instances, but I believe it is a well-ascertained fact that foreign

Mr. A. Hutcheson.

21 June 1894.

produce is carried at a much lower rate than home produce.

24,682. But you have no specific instances to bring before the Commission?—No.

Rent.

24,683. What is the average extent of the reduction of rent in your district?—On strong land fully 50 per cent., and on black land about 25 to 30 per cent.

24,684. Why do farmers offer too high rents?—You would need to go and ask the gentlemen that do; I am sure I could not tell you myself.

24,685. (*Chairman.*) You said possibly it was owing to the difficulty of finding investments; in other words they are prepared, I suppose, for a somewhat lower profit?—Yes.

24,686. (*Mr. Lambert.*) Is it not also due to the fact that the farmer is usually not fitted for any other occupation after he has been farming for, say 20 years?—I believe the majority of them are not fitted for any other occupation, but I think it is principally owing to the fact that the younger men just now are going into land at those rents; a great many of them at any rate. Of course, as you say, after a man has been 20 years at a certain occupation, he is not worth much for anything else.

24,687. Is there not somewhat of a desire for farmers to get into a holding, and then trust to the generosity of the landlords?—There is a good deal of that.

24,688. And that is not a good system?—It is a very bad system. As I said before, under a 19 years' lease, I could sympathise with a man making a mistake some years ago, but not now.

Rates.

24,689. Do you understand the system of rating in Scotland; I believe you have a graduated scale whereby land bears a certain amount, and houses bear a certain amount?—I would not like to enter practically into that. I do not say that I do not understand it, for, of course, I know myself in regard to my land what it has to bear. In offering for land a man ought to know what burdens it has, and he ought to add them to his rent—they are rent.

24,690. So that really a reduction of rates would mean an increase of rent?—Of course, if you have less rates to pay you could afford to give a little more for the land.

24,691. I understand that in Scotland you have a kind of graduated system whereby land pays a certain amount in the £, and houses pay a certain amount, and other kinds of property pay also different amounts?—Yes, I understand so, but I am not qualified practically to speak on that point. Of course, I only look at it from the point of view of the taxation which falls upon the farmer's shoulders specially.

24,692. Do you know how much the land bears of the taxation; how it is rated; whether it is rated to its full value, or half or quarter, as the case may be?—In the taxation which is put on farmers in the income tax schedules they are generally rated on one-third of their rentals.

24,693. I mean the local rates?—I could not say exactly.

Size of farms.

24,694. (*Captain Owen Thomas.*) What is the average size of the farms in your district?—They vary very much. In the Carse of Gowrie they are about a couple of hundred acres; in Strathmore where the land is easier perhaps they are a little larger than that.

Large and small farms compared.

24,695. Which has suffered the more, small farmers or large farmers?—As I said before, I think the small farmers have perhaps not felt it quite so much in this way, that they have laboured more themselves; whereas the large farmers have everything to hire, and so I think perhaps they have felt it more.

Reduction of prices and rents.

24,696. What would you say has been the average reduction in prices of all farm produce combined?—Within what time?

24,697. 15 years?—From 30 to 40 per cent. at any rate.

24,698. Have the rents been reduced in proportion to the reduction in prices?—It would not be possible to reduce the rents in proportion to the reduction in prices because the rent would disappear altogether if you were to do that.

24,699. I think you said that some of the land had been reduced from 3*l.* to 1*l.* an acre?—Suppose I grew some years ago four quarters of wheat at 2*l.*, that was 8*l.*; and now I grow four quarters at 1*l.*, that is only 4*l.*; the rent there is nothing, it disappears four times over.

Mr. A. Hutcheson.

21 June 1894.

Rates.

24,700. What is the usual system of assessing farms in your district for local rates, poor rates, and so forth; how do you arrive at the rateable value of the farms?—I do not think they give us any deduction in the poor's rate; the proprietor pays half of the poor's rate and the tenant pays half.

24,701. I do not think you have understood my question. I am asking you how do they arrive at the rateable value of a farm?—They arrive at the rateable value by the rent inserted in the valuation roll of each county.

24,702. The rent of the farm?—The rent of the farm.

24,703. Any deduction made?—Not for those poor's rates, the school rates, and so on—they are charged on the full rent of the farm.

Importation of Canadian cattle.

24,704. About the Canadian cattle; what was the age of the cattle when you bought them for fattening purposes?—From two to three or four years old.

24,705. Did you buy them by weight or otherwise?—We bought them principally by the eye. I have put them over the steel yard.

24,706. What is the average price paid for them?—10*l.* or ten guineas.

24,707. And that, of course, would be very much less than home-bred cattle?—Yes, and the beauty of them is, that they fat very much quicker, what we call far more inside fat; they are better fattened than the Irish cattle, as a rule.

24,708. How long did you keep them?—These cattle that I speak of at ten guineas, we would need to keep them from 9 months to 15 months.

24,709. Were they in fairly good condition?—In fairly good condition.

24,710. Do you breed cattle yourself?—No.

24,711. Have you any idea as to what it costs an English farmer to breed store cattle?—No, but I am perfectly certain that he cannot bring up a two year old at 10*l.* profit.

24,712. Are you quite certain of that?—At 10*l.*?

24,713. Yes?—I do not think I can do it in Scotland, I do not know how they do it in England.

24,714. How much an acre is it for a good pasture?—Lowland pasture?

24,715. Good keep for bullocks or cattle?—There is a good deal of land let in the spring, grass parks, and they let all the way from 30*s.* to 3*l.* in some cases, and more, per acre.

24,716. How many head of cattle per acre?—It is pretty good grass that will graze a beast an acre.

The marking of foreign meat.

24,717. Are you in favour of marking foreign meat?—Yes, if it could be practically done; but it is surrounded with a great many difficulties, I think. If it could be done it is quite fair to mark it.

24,718. Would you mark the imported cattle that you fatten?—I do not know. Up to a certain time of the cattle being in the country, I should not think they would need to be marked.

24,719. Where would you draw line. Some people may keep them a fortnight, and send them to market?—I say that is surrounded with a great deal of difficulty.

Mortgages.

24,720. (*Mr. Everett.*) You recommended the system of buying farms in Scotland now and obtaining part of the money on mortgage?—Yes.

24,721. Can you tell me what interest a farmer buying land would have to pay for his money?—From 3 to 3½ per cent.

24,722. Are you also aware that the people who have bad land and mortgage it, taking great and little, are the people who have suffered more than anyone else?—But that was bought years ago; I am speaking of the present value of land.

Prices.

24,723. What you recommend will only be safe when prices maintain a steady level, if they continue?—If they come any lower it will be ruin to us all round.

24,724. Is it your opinion that steady prices are an advantage?—Of course.

24,725. And supposing prices were to rise somewhat, and maintain the rise, do you think labour would be

Mr. A. Hutcheson.

21 June 1894.

able to take care of itself, and get its fair share of the rise?—Yes.

24,726. And would farmers, in your judgment, be benefited by the rise?—I think so.

Rent.

24,727. Your experience when you paid your highest rent was, that you did better than you do now?—That is quite clear when you take the prices of produce into account.

24,728 If prices continue to fall, you look for it that rents will have to go; that rent will have merely to disappear, as I understand; you say that further reduction of rent is what we have to look at?—And I believe that.

24,729. Would the total disappearance of rent, in your opinion, be a calamity or a blessing to the nation?—A calamity.

Scale of compensation.

24,730. I am rather inclined to think you differ there from some gentlemen who sit around this table. You spoke of a scale for compensation for feeding stuffs and manures applied to the land, is it not the fact that the quality of the land on which the feeding stuffs were consumed, or the manure employed, would have a great deal to do with what benefit it retained; would not that be a very material factor—the quality of the land itself—whether it retained the manure?—It would be a material factor, but of course the consumption of the same amount of cake on poor land would never make it good land.

24,731. You think that it would not improve it, that it would not make the money value for an incoming tenant from a large consumption of cake and corn on poor land that it would do by its consumption on good land?—I do not know; poor land would need it most, in order to increase its fertility.

24,732. Do you think it would remain for two or three years on light sandy land, for instance?—Certain classes of manure would not, but what we call crushed or half-inch bones, should remain for a considerable number of years.

Scheduling the condition of farms.

24,733. Several witnesses have advocated that the best system as between an incoming tenant and outgoing tenant, and for the protection of the landlord too, would be that there should be a full description of the state of every field when a farm is entered on, kept for comparison when that farm is quitted, the tenant to make good any deficiency, and to be recouped for what he had added to the cleanness or fertility. Would not that be about the best way that there would be of having land kept in proper condition?—Yes: but I am afraid it would be difficult to work into practice—it would lead to a great deal of difficulty in a settlement.

24,734. Do not you think that a competent valuer viewing a farm can judge what is due to the outgoing tenant or to the landlord, better than any Act of Parliament can? Is it not a matter that essentially requires judgment in respect of the soil and circumstances?—Yes, but in 9 cases out of 10 it would be very unlikely to show it at the beginning and end of the lease.

24,735. Do not you imagine that each decade has its valuers of equal competency?—Yes; but if you are going down to the state of the field, and have a man to go over it, it would need to be the same man, unless the land was very badly used. If a man were to allow it to go to wildness any competent farmer could tell that, but I am afraid it would lead to a great deal of difficulty in the actual working.

Land out of cultivation.

24,736. You said no land had gone out of cultivation in Scotland, and it was not at all likely to?—I do not think so.

24,737. I was given to understand that there was more uncultivated land in Scotland than in any other part of the British Islands?—You refer to the Highlands?

24,738. The moors?—I think the moors are better adapted to that than any other purpose. I would have no objection to their remaining moors; they bring in a good many English tenants with plenty of money, and the moors do more good in that way than in any other way. I do not call that uncultivated land, because it is not capable of cultivation.

24,739. You have plenty of land that is too poor, that is not worth cultivation then?—You could not cultivate the hill sides; you could not do it.

24,740. I was glad to hear you say how long-headed the farmers are?—We consider ourselves so.

24,741. You are sufficiently long-headed, I take it, to be able to understand that in agriculture price is a matter of very first class importance?—Certainly.

Mr. A. Hutcheson.

21 June 1894.

Prices

24,742. Have you ever considered what price is—what is meant by price?—The value what we can get for what we can grow.

24,743. The money that you can get?—Yes.

24,744. The farmer makes money; he exchanges his produce for money?—Yes.

24,745. And does not anything that adds to the money side of the exchange affect him quite as much as anything that happens to the produce side of the exchange? Do not you think if anything happened to raise the value very much, would not he get less money?—Yes; to depreciate his money.

24,746. Are you aware that from the earliest times silver and gold have been the world's money?—Yes.

Bi-metallism.

24,747. And are you also aware that legislation for the last 20 years in one country and another has excluded the use of silver, and compelled the use of gold instead?—That is too deep for me, bimetallism. I really believe there is something in it, but I frankly own I do not understand it. I am a practical farmer, and do not know anything about it, and I have never made it a special study.

24,748. Are you opposed to money changes which artificially lower prices?—I am in favour of anything that will heighten prices so that I must be against anything that lowers them.

24,749. You are in favour of free trade in commodities?—Yes.

24,750. Does not it appear to you equally reasonable that there should be free trade in money and that other precious metals should have the same protection as gold money?—There appears a great deal of fairness in that.

24,751. Is not the excluding of one of the precious metals virtually protection?—Some people say it is, and some people say it is not.

24,752. The farmers are ridiculed when they ask it to be extended to their produce?—That may be so.

Labourers' cottages.

24,753. (*Mr. Elton.*) Most of the labourers' cottages belong to the farmers, do they not?—They belong to the proprietor, but they are let to the farmer.

24,754. How is that in the case of old-established villages where a lot of old labourers have cottages?—That statement excludes villages, but in Scotland the ploughman's houses, both married and single servants are let along with the land.

24,755. In the case of an old hamlet or village with cottages to which there may be rent not attached, to whom do they belong?—They generally belong to the proprietor.

24,756. And then they have been allotted to certain farms so as to give control to the farmer?—No, I am speaking of the servants only who are directly under the farmers' control.

24,757. With the exception of what I may call the old-established village cottages the system of agriculture is to stock the farm with a sufficient number of cottages?—Yes.

Labour.

24,758. Is the standard of labour well maintained now? You say you have sufficient labourers, and do they work, in your opinion, as well as they did a few years ago?—There are complaints; personally, I say that the farm servants are loyal servants.

24,759. I did not mean any imputation on their characters, but are they too old from all the young men going off the land?—There is an equal proportion of young and old men.

24,760. You do not notice any deficiency or change in that respect?—As a rule the young men have not deserted us.

24,761. And in England the complaint is the other way?—I understand that.

Payment of labourers in kind.

24,762. But when you pay the labourers a part of their wages in produce and kind has any question arisen about the Truck Act in connection with it?—No; I do not see how there can be. I understand the Truck Act is where the man makes profits out of supplying the labourers with the means of living; but instead of a profit I hold that the farmers get a direct loss.

Mr. A. Hutcheson 21 June 1894.

24,763. You suppose that the meal and other produce is supplied at the cost price?—Well, the majority of the farmers in Scotland keep cows, and give their labourers so much milk every day, and the majority of the farmers tell the miller to leave at the labourer's cottage half a boll of meal every month, so that they cannot make any profit out of it.

24,764. I especially did not ask about the milk, because I had in my mind something about its being refreshment and food, and the truck on the meal seemed a little doubtful?—Some farmers may send the meal to their labourers, but the majority give a standing order to the miller to leave the meal.

24,765. That is not extended to cheese; they do not pay in cheese?—No, in potatoes perhaps.

24,766. They would not make a profit out of potatoes?—We just give them a cart load or so.

24,767. That comes to a very little more than allowing potatoes as in the south?—It is 3*l.* or 4*l.* a year on an average.

24,768. You said you had great difficulties caused by the penal rents?—Yes.

24,769. They are not treated as *in terrorem*?—I have known of cases.

24,770. Was any appeal made in consequence, or was any trial held?—It went to arbitration; of course, if a man signs them he may be caught by them.

Condition of the labourers.

24,771. (*Lord Rendel.*) With regard to labour you were saying that with 25 years' experience of labour-paying wages had gone up from some 20*l.* or 25*l.*, to nearly 31*l.* or 32*l.*?—Yes.

24,772. And then the meal, and the milk, and the produce, you valued at 19*l.*?—Something like that, and a free house, and all other perquisites.

24,773. In fact, the average would come to something like a guinea a week?—Something like that.

24,774. Then you referred to the fact of a general improvement in the condition of labourers due to the lower prices?—The labourer has an advantage in having his living cheaper.

24,775. In fact, he is in a much better condition since, within your experience, of farming?—I certainly think so.

Quality of labour.

24,776. Do you consider that you get the benefit of a higher quality of labour in exchange for that increase?—I cannot say that we have any higher quality of labour. It is much about the same. We just need to do the same work on a farm as we did.

24,777. You do not find in farming you are recouped to any substantial extent for the increased cost of the labour by the increased value in the quality of labour?—No.

24,778. Or by the energy or intelligence of the men?—Perhaps the men are fully more intelligent than they were since the Education Act came into force, and we need more intelligence, because we have a great deal more machinery than we had in those days. But if you take a 200-acre farm to-day, and then farm it all, and have it all under the plough, you need as many labourers as you did then.

24,779. Therefore the cost of labour is absolutely higher?—It is absolutely higher.

24,780. And without any recovery on the ground of better condition of the labourer?—Certainly.

Prospects of farming.

24,781. (*Chairman.*) You renewed your lease lately for another 19 years?—Yes.

24,782. Did you take power to break it at the end of five years or not?—No.

24,783. Then you appear to estimate that at present prices you could get a profit?—It is rather a private matter. I did not intend to bring it up. But Lord Kinnaird will not be offended. I did it on the principle that I had brought the farm into very good condition, and three years from the end of the lease I thought it a favourable time to go into the question of renewal. Lord Kinnaird asked me to make an offer, and I made an offer for 19 years at such-and-such a rent. I had my farms in first-class condition, and I thought it much better to carry them on than to make a change.

Mr. A. Hutcheson. 21 June 1894.

24,784. You think that at present prices you can make a profit during the 19 years?—I do not say that I can make a profit, but I hope to farm without loss.

24,785. Making interest on your capital?—If we get the changes that are promised in the monetary standard, I am prepared to make a big profit.

Tenant's capital.

24,786. What do you consider the capital you have embarked in this farm?—About 4,000*l.*

24,787. How much per acre is that?—From 10*l.* to 12*l.*

24,788. I think you said that was above the average, that most farmers were going in with less capital?—A great many of them try it, but I think you need 10*l.* or 12*l.* an acre to do well.

24,789. You think that the average farms are about 200 acres?—Yes.

24,790. How much capital would the young men that you spoke of, coming into farms of that size, have?—I cannot very well say, but I know that a good many of them have tried to go into it on perhaps 6*l.* and 7*l.* an acre, and then they have met with difficulties and lost some of their capital.

24,791. Would you think you could bring a farm fairly under cultivation for 8*l.* or 10*l.* an acre?—10*l.* is merely the minimum on arable land, to do justice to it.

24,792. Then a farm of 200 acres would require 2,000*l.*?—Yes.

24,793. And they are most ready to come into the farms?—They are ready to come in; whether they have capital or not I cannot say.

24,794. But I think you said one of the reasons for the farms letting was the difficulty of finding other investments?—Yes.

24,795. There is an inducement to come into farming because although the profit is low, still it is better than they can get elsewhere?—Yes, and they have it under their own control, and they do not get swindled; they have it in their own hands.

24,796. On the whole, it is a safer investment than trusting it to others?—Yes, I have known plenty of farmers—I know one farmer who has put his money into stock—they have a great deal of risk unless they manage it themselves.

24,797. But they have the alternative of taking their capital elsewhere?—Yes, but the accounts that we get from most countries just now, are fully as bad as they are at home.

24,798. So that on the whole many of these young men think they will do better in farming in Scotland?—Yes, they do.

Bailiff's salary.

24,799. What is the salary of a bailiff in your district?—A grieve, we call him.

24,800. Yes?—About fully 40*l.*, with a good many more perquisites than an ordinary man. He generally has the cows, and he gets the surplus milk, and a good deal more in some cases.

24,801. About double the wages of the labourer?—I would hardly say double.

24,802. Not double?—That is too high. If you put the ordinary ploughman's wages at 50*l.* a year, I think you would need to put it at about 70*l.* or 75*l.* for the grieve.

The witness withdrew.

Mr. A. Ralston.

Mr. Andrew Ralston called and examined.

Mr. A. Ralston.

21 June 1894.

21 June 1894

24,803. You are the agent to Lord Strathmore?—Yes.

24,804. Do you manage the whole of the property?—Yes; the whole of the Scotch property.

24,805. Of 22,000 acres?—Yes.

Particulars of estate under management.

24,806. Of which 15,000 are arable, and 5,600 are pasture?—Yes; chiefly hill ground.

24,807. And 2,000 acres are woodlands?—Yes.

24,808. What is the number of farms on the property?—152 farms. The rents of 35 farms run from 200*l.* to 800*l.* per annum, of 17 from 100*l.* to 200*l.*, of 22 from 50*l.* to 100*l.*, and 78 are under 50*l.*; they are small holdings.

24,809. What are those under 50*l.* a year; are they farms on which tenants can make a living?—Do you mean the small farms?

24,810. Yes?—They can make a living well.

24,811. What is the average size of those farms under 50*l.* a year?—I should think from 10 acres to 50 acres.

24,812. What is the lowest amount of land that a man could make a living out of?—A pair horse farm; 70 acres is a very good thing, but the farmers working themselves do make a living under 50 acres.

24,813. What has been the fall of the rents on the property?—22½ per cent.

24,814. Since when?—Since the depression began, I think, in 1879.

24,815. What has been the expenditure of the owner?—The expenditure is 27 per cent. of the rental.

24,816. Has that been more in past years, or lower?—Just about the same; more within the last 12 or 15 years, but not very much. I should say about the same for the last 20 years, the 27 per cent.

24,817. What is the total rental of the property?—The total rental of the property taking it at its highest was 23,300*l.*, and now it is 18,300*l.*

24,818. And the annual expenditure on improvements is about 4,800*l.*?—4,862*l.*

24,819. Then since 1879 has any interest been charged on those improvements?—No interest has been charged on those improvements.

24,820. Is land let on lease?—The land is let on lease. Some large farms are let from year to year, but generally speaking they are let on a lease of 19 years with the option of a break to either party at sometimes 5, 10, or 15 years.

24,821. Practically it is only a lease for five years?—Yes; for five years.

24,822. Have the rents been well paid?—They have been extremely well paid.

24,823. And no arrears have accumulated?—No arrears have accumulated, and indeed, arrears have been paid off.

24,824. Beyond the permanent repairs there have not been many abatements of rent?—There were abatements given at the time when the depression began, and all the farms have been re-let since that time to the old tenants or their sons.

24,825. Have there been many failures of the tenants on the property?—Only three, and those were not in connexion with the land, but in connexion with the conduct of the people themselves very much.

24,826. Have there been many changes of tenancy?—Very few indeed.

24,827. And have the tenants generally renewed their leases?—I may say they have almost altogether renewed them.

24,828. Almost always?—Almost always.

Effect of the depression: (*a*) owners.

24,829. What has been the effect of the depression in your district?—On owners it has been very great, and on owners of all kinds, large or small, absolute or limited.

24,830. Was that in the direction of the loss of rent?—Yes, and the large expenditure.

(*b*) tenants.

24,831. Well then, as to the tenant farmers in the district?—All classes have suffered, and I think all have suffered much alike.

24,832. They have suffered from the increased cost of production?—Increased competition and importation from abroad, reduction of prices, in fact.

24,833. Have the smaller tenants suffered less than the larger ones?—Much alike; although the smaller tenants have not suffered quite so directly, in consequence of having their families to assist them in the management of the land, as I have explained in my statement. You will see that that is done at the sacrifice of the interests of their children, whose remuneration consists chiefly in getting their food and clothes, but who would otherwise be receiving good wages as artisans, agricultural labourers, or domestic servants.

24,834. They remain with their parents?—They remain with their parents.

24,835. And that enables them to get through the bad times?—Yes.

(*c*) labourers.

24,836. As to the agricultural labourers of the district, what do you say?—I think, on the whole, their position has improved.

24,837. Have the wages increased during that period?—During the last 20 years they have increased from 10 to 15 per cent.

24,838. Was that mainly before the depression?—No, I think not. Wages have increased generally during the last 20 years, but if you go back to 30 years the increase is greater, I should think, fully 30 per cent. in that period.

24,839. But during the last 20 years they have increased from 10 to 15 per cent. to your own knowledge?—Yes.

24,840. And besides, the labourers have had the full benefit in the fall of prices?—Yes, in food and clothing and whatever they had to buy.

24,841. And their position must be a great deal better?—Yes.

24,842–3. You cannot say that they have suffered?—Their condition has very much improved.

24,844. (*Chairman.*) Has there been a reduction in the number of labourers?—Not on Lord Strathmore's estate, or in the whole district of Strathmore. I think there are the same number of labourers employed now as there were 20 years ago.

24,845. At what size of farm does the farmer begin to emply a labourer?—If he has no family he begins on a 70-acre farm.

24,846. To employ one labourer?—He employs a labourer.

24,847. And what does he employ on a farm of 200 acres?—Well, if it was wrought on the five-course system, 40 acres would be green crop, and he would employ four or five labourers.

24,848. Does the farmer himself work or not?—He does work. He does what is called in Scotland odd work. He repairs the palings or fences, or a little work of that kind, and takes the general supervision of the whole farm. I mean the medium and small farms.

24,849. Then the labourers not only gain in their money wages, but get the benefit of low wages, and I think you said improved cottages?—Yes, improved cottages too.

24,850. And they have had the benefit of free education for their children?—Yes, free education for their children.

24,851. Therefore the labourers have got considerable advantage?—Decidedly so. Labour is very good.

Quality of labour.

24,852. Has the quality of labour been maintained?—I think quite. There has been some difficulty within recent years, servants breaking their engagements, and leaving their situations, but I think that has gone past now. I think they have got a lesson, and they do not do it so much as they used to do; that is, young men (not the married men who have houses) who live in bothies.

Cottages.

24,853. Has the landlord spent much money in improving the cottages?—Largely.

24,854. Of that sum of 4,800*l.* a year, has a good deal been spent in cottages?—A good deal in cottages. A cottage for a labourer costs 160*l.* to 180*l.*, with three apartments, and an outhouse, a coalhouse, and a little scullery.

Mr. A. Ralston. 21 June 1894.

24,855. (*Viscount Cobham.*) Do those cottages stand by themselves?—Yes.

24,856. What would a pair cost?—About 350*l.*

24,857. (*Chairman.*) Has any land gone out of cultivation?—None whatever.

The letting of farms.

24,858. When farms are vacant is it possible to let them?—Yes. We generally have plenty of applications, but as a rule we always give the offer to the old tenant, and we generally agree, almost always. I do not think I have turned off a man for 35 years.

24,859. If a death occurs, or the tenant wishes to go, what do you do?—If a death occurs, or the tenant wishes to go, we sometimes have private offers, and if not we advertise.

24,860. You find no difficulty in re-letting?—We get a little more rent than before, it is hardly appreciable, but it is up to 5 per cent. more.

24,861. That shows there is an increased demand for farms?—There is an increased demand only within the last two or three years; before that we had some difficulty, but the rents were reduced to conform to the agricultural prices, as we thought.

Tenant's capital.

24,862. Do you find men of sufficient capital to take the farms?—Yes, when we take a man as tenant of a farm we inquire particularly into his means. I would not have a man without capital. We contend that a man wants about 10*l.* an acre; of course it depends upon the quality of the land. If the quality of the land is very good there would be more cattle to keep, and more money per acre would be required.

24,863. What is the amount for average land?—10*l.* would do it. It used to take 12*l.*, but the price of cattle is reduced very much.

24,864. The same amount of capital goes further then?—It goes further.

24,865. Is that on account of the low prices?—Yes.

24,866. So that a tenant comes in at at some advantage?—He comes in at some advantage.

24,867. (*Mr. Channing.*) You have no difficulty in meeting tenants with that amount of capital?—No difficulty whatever.

24,868. (*Chairman.*) Then with regard to the increased spending power of the agricultural class, I suppose that all the tenant farmers have their means impaired?—The tenant farmer's capital is certainly decreased, I think—it is diminished very much. But in the case of the labourer it is increased.

24,869. But still the profits of farms do not appear to be reduced to a difficulty in getting new tenants?—There is no difficulty in getting tenants.

24,870. Men are prepared to come in with sufficient capital at the rents asked?—There is no difficulty just now.

Foreign competition.

24,871. How do you account for the low prices?—Foreign competition very much, and large importations into the country, and diminished demand on account of bad trade.

Free trade.

24,872. Do you think that foreign competition has been fostered by the artificial tariffs in foreign countries?—Yes, I do.

24,873. You go on to say in your statement that it is also "encouraged by the apathy of this country, and its "bigoted adherence to the theory and its treason to "the practice of free trade"?—I am sorry to say I think that is the case.

24,874. What do you mean by that?—I think they adhere to the theory, but certainly depart from the practice of free trade, in consequence of having large duties imposed upon all our goods which are sent out to America and other places, while we allow our ports to be opened to them.

24,875. Then, in other words, you object to free trade?—I rather go in for free trade all round. I am a free trader if you do it all round—a fair field and no favour.

Retaliatory duties.

24,876. Provided you cannot get it abroad, what would you do here?—Put on retaliatory duties to a certain extent. We will take America. If they allow our wool to go in free, we will take their mutton. If they do not, we will put a duty on their mutton; and if they allow our potatoes to go in, we will take their cattle, and so forth as the case may be.

Mr. A. Ralston. 21 June 1894.

24,877. The effect would be that consumers would have to pay more for their food?—And they would be better able to do it.

24,878. What would be the effect upon the labourers?—I think it would be a very great benefit to the labourers. They would get higher wages, and it would make very little difference in their living expenses.

24,879. But they appear to have got higher wages under the present system?—They have; but they would get higher wages under the other system.

24,880. Higher still?—I am quite sure they would be higher still.

Tenure.

24,881. With regard to the subjects which have been complained of by the agriculturists, take first the system of land tenure?—With reference to this system of land tenure, I do not know that there is much to complain of. In letting a farm to a tenant, I always consult him with reference to the way in which he is to manage his farm. It depends upon the farm. Some farms require a certain rotation; but probably I had better go on with reference to the system of tenure. I think the majority of farmers would prefer to make their own bargains.

24,882. Is there any demand in your district for the interference of any tribunal as between landlord and tenant?—There is no demand whatever for that.

The Agricultural Holdings Act.

24,883. Then with regard to the working of the Agricultural Holdings Act, what is your opinion about it?—There is not much to complain of, I think, further than that I have to express a grievance which the landlords have, and that is that there is no power under the Act to enable the landlord to recover damages for deterioration beyond the compensation which is paid to the tenant. Now, in my case I know,—I have some in my eye just now — that farms have decreased in value by 10 to 20 per cent. on the letting value, from the bad management of the sitting tenant. I am not talking about Lord Strathmore's estate just now, but about the country generally; and I know a case of this kind where a farm has been reduced in letting value from 10 to 15 per cent., that the tenant has got large compensation for unexhausted manures and feeding stuffs.

Damages for deterioration.

24,884. What change would you recommend?—Well, both tenant and landlord should be put on the same footing—that if there is deterioration the tenant should pay fully for it, and that if there is an increased fertility the landlord should pay for it.

24,885. (*Viscount Cobham.*) Cannot the landlord counter-claim in Scotland?—Only to the amount of the tenant's claim, not beyond it. I know farms where claims have been paid for compensation, where the letting value of the farm by mismanagement has been decreased from 10 to 20 per cent., and if you take that for a 19 years' lease on a 300*l.* rent, that is 30*l.* for 19 years; you see what that comes to owing to the bad farming.

24,886. (*Chairman.*) Does your proposal involve a careful inventory of the state of the farm at the commencement of the lease?—No, that is difficult to get at, I do not see how it is to be done—an inventory at the commencement of each lease.

24,887. How are you to ascertain at the close of the lease whether the farm has been deteriorated or improved?—I know the farms 19 years ago, when the present tenant went there, and I know them now.

24,888. That is all very well for you in the position of agent, but in the matter of a dispute between the landlord and tenant how is it to be determined whether the land has deteriorated?—Leave it to a man who has known the farm 19 years ago, and who knows it now, that is the only way to get at it.

24,889. Do you think it would be easy in each district to get a competent man, to know the condition of the farms?—I think it would be.

24,890. (*Mr. Channing.*) Would you not require them to state the condition on paper at the outset?—That would be rather vague, because one man might call a very badly managed farm good husbandry, and another man have a very different idea of good husbandry.

24,891. (*Chairman.*) You do not think it practicable?—No.

24,892. It would all depend upon you, who knew the condition of the farms 19 years ago?—Quite so.

Law of distraint.

24,893. With regard to the law of distraint, what do you say?—I do not think that has been a benefit to the tenantry of Scotland.

24,894. (*Mr. Everett.*) You mean the abolition of it?—Quite so.

24,895. (*Chairman.*) Would you revert to it again?—I think it would be an advantage to the small holders; such people as ploughmen who want to take farms, it would be an advantage to them.

24,896. Would you re-establish it now that it has been done away with?—It is of no importance.

Slaughter of foreign cattle.

24,897. With regard to the sale of imported goods as home produce, what would you say?—I am of opinion that as soon as there is any reason to suspect that we are importing diseased animals from abroad, they ought to be slaughtered on debarkation. I think we are all at one on that point.

Railway rates.

24,898. And then with regard to railway rates?—I have nothing to complain of in regard to the railway rates so far as they are applied to the produce of the country. But I do complain of foreign produce being carried at a cheaper rate than we pay.

Restrictions on cultivation.

24,899. Next with regard to restrictions on the methods of cultivation. What is the practice of the estate under your management?—I cannot see very well how you can get on without certain restrictions, because a man when it comes to the end of his lease may leave the whole farm under the plough, and we all know that would be ruinous to the farm. If a man becomes bankrupt in the middle of his lease, he might leave his land in that state, and that would be a ruinous business for the farm and the landlord. In fact, when letting the farm, I always consult with the tenant as to the mode of cropping he would like to have, and he generally gets that—almost always gets it. I put a restriction on having two white crops in succession; I will not allow that.

24,900. Did I understand you that you do not enforce these restrictions except towards the end of the lease?—I never had any complaint about the restrictions.

24,901. Never any complaints?—Never any complaints. It may be near large towns, but we have no complaints in our district about that.

Remedies for the depression.

24,902. What are your proposals with regard to the remedies for depression?—Partial remedies would be the reduction of rates and taxes, the granting of State loans at considerably lower rates than at present for the purpose of agricultural improvements, the equalisation of railway rates on foreign produce, and reductions of burdens upon land, and the prevention of foreign agricultural produce such as beef or mutton being sold as home produce. But these are partial remedies.

24,903. What are the others?—Something more is required to restore agriculture to a state of healthy prosperity, and that, in my opinion, is free trade all round, or something equivalent.

24,904. You suggest therefore that there should be retaliatory duties?—Yes.

24,905. Upon all agriculture?—If we cannot get foreign countries to agree.

24,906. Upon all agricultural produce?—Upon all agricultural produce.

24,907. Do you think that is at all likely to be carried out?—I should like the Legislature to try it.

The Agricultural Holdings Act. Claims and counterclaims.

24,908. (*Mr. Elton.*) You were speaking about the counterclaims under the Agricultural Holdings Act. I thought for a moment you were discussing the question of set-off and the counterclaim. The landlord's set-off is limited by the amount of the tenants' claim, is that so?—Quite so.

24,909. Because that is in the nature of a set-off. I understand from the nature of the Act, and the usual interpretation of it, that that does not apply to the counterclain; the landlord's counterclaim may exceed the tenant's claim?—That is not my reading.

24,910. I do not know what that is. But the tenant claiming compensation, shall give notice in writing to the landlord of his intention to make the claim. Where the tenant gives such notice "the landlord may, "before the determination of the tenancy, or within "14 days thereafter, give a counter notice in writing "to the tenant of his intention to make a claim in "respect of any waste or breach of covenant or other "agreement," and then it is considered that "if the "tenant's claim falls through"—this is Mr. Jeudwine's book)—"or if he withdraws it, the landlord may go on "with the reference and obtain compensation." It does not apply to the Scottish Act. You are reading from the English Act?—That is very different from Scotland.

24,911. Certainly in our English Act there is the set off and counterclaim?—We have not that; we can only get compensation for deterioration up to the tenant's claim, and no further.

24,912. That is not the case in this country at any rate?—I thought you were reading the English Act.

24,913–15. But there is no distinction between set-off and counterclaim in your estates?—No.

24,916. The set-off in England is a common thing?—Yes.

24,917. Do you think that the law in Scotland ought to be altered in that respect?—I think so. It ought to be altered.

24,918. To the same effect as the Act I was reading, or to that effect?—Yes, to that effect.

Cost of labour.

24,919. Only one more question. The landlord, the farmer, and the labourer between them, I suppose get what comes out of the land, the profit. You have told us that the labourer's share has increased very much?—Yes.

24,920. That seems to involve a very great diminution of one of the other two?—To a certain extent it does. But still, the increased wage comes from the employer, but the food does not, of course.

24,921. But I say the difference comes from the other two, or one of the other two?—Yes.

24,922. Do you consider that a very large proportion, or a small proportion, or what proportion of the loss of the landlord, is caused by this increase payment of the labourer?—It is very difficult to say.

24,923. Do you think that all the depression is due to that?—It ultimately will fall, I think upon the landlord.

24,924. Do you think that 27 per cent. fall in rent corresponds to the increased profit going to labour?—No.

24,925. Twenty-seven per cent. I think you said?—Twenty-two-and-a-half per cent.

24,926. Do you think that is accounted for by the rise in the profits paid to the labourer?—I do not quite follow you.

24,927. We said there were three people, the landlord, the farmer, and the labourer, who between them had the whole of the profits?—Yes.

24,928. And then the labourer has more now than he had a few years ago?—Yes.

24,929. And that rise in his share would come out of the other two, or one of them?—So far as the wages are concerned.

24,930. Do you think the landlord's loss of 22 per cent. or a great portion of it, is due to the increased payment to the labourers?—No, I do not think so at all.

24,931. You have given us much in the way of premise, how do you get away from the conclusion, and say that the landlord's share, or rather the reason of the landlord's share of the rent having decreased is entirely from the want of demand, and the lower prices that the farmer is getting for the produce? You think none of the difference is due to the labourer?—Very slight, a trifle in comparison to the fall of prices of farm produce.

24,932. That is to say the price of labour—that the rise of say 20 per cent. in the sum contributed to labour—makes a very small difference in the rental?—A very small difference to the landlord; it makes a large difference to the farmer, and ultimately it would probably fall on the landlord at the end of the lease, because the tenant would take into account the increased wage in offering for his farm.

24,933. Are we to take it that it comes from the landlord?—Yes, quite so.

24,934. But that does not account for much of the 22½ per cent.?—No.

24,935. That is a sum in arithmetic—that can be worked out?—I quite understand.

24,936. It can be worked out?—Yes.

24,937. But your opinion is that it cannot be worked out in that way?—No.

Mr. A. Ralston.
21 June 1894.

Scheduling the condition of farms.

24,938. (*Mr. Everett.*) With regard to the system we have had recommended to us by many, of entering on a farm with a written description of every field, and leaving it by comparison with the same, you seem to see difficulties rather in the way, I think?—I see the difficulty of unrestricted cultivation a great difficulty. In fact, so great a difficulty is it that it would ruin the country almost if it were carried out by farmers. On the other hand, though, we have a lot of very good farmers, and I do not suppose they would take advantage of it. But there are men who would take advantage of it when it comes to the end of their lease.

24,939. With regard to the cleanness of the field, there would be no difficulty if a competent man went over the farm to see that each farm was clean, or only middling, or very foul. As regards cleanliness, they could divide the land into three classes, could not they?—No.

24,940. Do you not think that an experienced man, if he looked at the stubbles, by the indications that there would be could not say whether the land was in good manurial condition, or run out?—It is more difficult to do the dirty farm, with regard to the manurial value, than it is for a clean farm—much more difficult. The land has a different feel altogether. A field in fair condition, and very dirty, has a very different feel from what the same field would have if clean.

24,941. You do not often see high farming and a foul farm go together?—Not often. But I have seen a field in very fair manurial condition very dirty.

24,942. You think there would be practical difficulties in the way?—There are difficulties in the way, but the difficuties might be overcome. I do not think it would tell for much.

24,943. For many of us the count at the entrance and exit would be the fairest to both parties, the tenant paying for deterioration and being paid for improvements?—That is what I think.

Rates.

24,944. Can you give us the system of arriving at the local assessment for local rating in Scotland? I think you sat upon the assessment committee?—Yes, and I do not know if you have it in England, I rather think not, but we have a valuation roll printed and published in the country, and that valuation roll is the basis of assessment.

24,945. And what is that—is it the rent?—All the rent, and if interest is paid in improvements that is entered also in a different column—the rent in one column and the interest on improvements in another, and that is the basis of the assessments made.

24,946. Are all the local rates dealt with in that way?—Yes.

24,947. Do you make deductions?—We make deductions when we assess. For some purposes it is calculated on the gross rental, and others, again (for Poor Law purposes, I think) there is a deduction made, but no deduction is made for other assessments.

24,948. Do you charge at a different rate in the pound on a farm, for instance, and a dwelling-house, or a shop or a factory?—Not unless in a large town; in the country districts, in small villages, with perhaps 300 or 400 inhabitants, we do not make any classification; we do not classify them. We charge the tenants of those houses in the same way as the farmers and landlords—all one classification. Where steam power factories or anything of that kind, or trades of different kinds are carried on, we have to classify them; probably into two or three classes, as the case may be.

24,949. In this case is it in the power of the assessment committee to adopt an arbitrary classification?—The whole power is left to the parochial board, the board with the management of the poor. So far as I know they are only classified under the Poor Law Act; they are not classified under the Local Government Act at all. You take the valuation as the basis of all assessments of consolidated rates.

24,950. That is, the classification is chiefly made for Poor Law purposes?—Yes.

24,951. (*Mr. Gilmour.*) The Public Health Rate?—Yes. That was administered by the Poor Law authorities in former days, but not now.

Importation of Canadian cattle.

24,952. (*Mr. Channing.*) Have you expressed any opinion as to the importation of Canadian cattle?—I do not know whether that has been mentioned. The only opinion I expressed was the general one that if disease prevailed in Canada, or there was a suspicion of disease, the animals should be slaughtered on debarkation.

24,953. (*Mr. Chaplin.*) If there is a suspicion of disease?—Yes.

Mr. A. Ralston.
21 June 1894.

24,954. (*Mr. Channing.*) Can you give any evidence on the profits of Canadian cattle as compared with other store cattle?—Unfortunately I cannot personally. I am rather at variance with Mr. Hutcheson on that, but I have no personal knowledge of it.

The Agricultural Holdings Act.

24,955. About the Agricultural Holdings Act; you say there is a good deal of competition for the farms; so I suppose disputes between the tenants and landlord do not frequently arise, owing to this competition for farms?—Generally in Scotland there are very few changes, and it is only when changes occur that the Agricultural Holdings Act comes into operation.

24,956. Then there is always an adjustment between the outgoing and the incoming tenant?—As a rule, the proprietor and tenant manage to arrange these matters themselves; at least I have never had a case; I have had no case in all my experience of going to arbitration under the Agricultural Holdings Act.

24,957. You have had no farms in hand?—I have had no farms in hand, I am glad to say.

Compensation for deterioration.

24,958. Your idea, I understand, is that the landlord should have compensation for general deterioration of the farm by bad cultivation, and that the tenant should have compensation for increased fertility?—Decidedly so.

24,959. Owing to good cultivation?—Yes.

24,960. So far as I understand the Scotch Agricultural Holdings Act, there is a limit to the landlord's counterclaim?—That is the objection I have to it.

24,961. (*Chairman.*) In the English Act he can go beyond the claim of the tenant on any question, but in the Scotch Act the landlord cannot go beyond the claim of the tenant?—That is so.

24,962. (*Mr. Channing.*) That is the claim that I was asking about; whether there is any provision in the Scotch Act—I cannot find it—which does limit it beyond the four years at the close of the tenancy?—There is no claim recoverable beyond the amount that is paid to the outgoing tenant.

24,963 Is that in the Scotch Act?—Yes. I think I am right in that.

24,964. I cannot find any such provision to limit the landlord's counterclaim?—It is limited to the extent of the claim of the outgoing tenant.

24,965. Is that the practice of valuers?—Yes. The amount of compensation payable to the tenant shall be subject to deduction of any sums due to the landlord, but the landlord cannot go any further.

24,966. (*Mr. Gilmour.*) The Scotch Act mentions what he can do?—If he has exceeded the amount payable to the incoming tenant, the landlord can have no claim, except at common law.

24,967. (*Viscount Cobham.*) Only by deduction?—I think that is quite clear; that is held so. I have been arbitrator under the Agricultural Holdings Act, and I know that the landlord cannot recover more than the tenants claim.

24,968. (*Mr. Channing.*) But the counterclaim includes the theory of waste, which is practically unlimited compensation?—But you must recover them at common law; you cannot recover them under the Agricultural Holdings Act.

24,969. There seems to be something in the practice of the Scotch law which is quite different from the practice of the English law?—Yes.

24,970. (*Viscount Cobham.*) You can claim more?—You can claim more, but you cannot recover more.

24,971. (*Mr. Channing.*) You can in England?—I believe so.

24,972. (*Mr. Clay.*) You can claim under common law?—If we are to pay a claim under one law, we ought to be able to recover by counterclaim under the same law.

24,973. You have two claims?—But that puts us to great expense. It is a simple thing. If the Agricultural Holdings Act gives a tenant power to claim a certain amount of compensation for unexhausted manures, &c., if that tenant has deteriorated the land by bad management, we ought to have the right of claiming under the same law for the deterioration if it is beyond the claim payable to the tenant.

Mr. A. Ralston.
21 June 1894.

24,974. (*Mr. Channing.*) Then your opinion is that the Agricultural Holdings Act to work fairly and conveniently for all parties ought to cover all the incidents of both sides?—Yes, of both sides.

24,975. Could you give us any evidence as to the working of the 1887 Act, introduced by Mr. Munro Ferguson to establish the single referee principle?—No, I have no experience of that.

Leases.

24,976. May I ask whether the leases on the estate which you represent have a break in them?—Yes, whenever the tenant wants a break in the lease we give it, and if he wants it for 19 years he gets it; it depends very much upon the tenant. I ask him, "What do you want?" and he says, "I want a 19 years' lease with a break," and he gets it; and if he wants it for the 19 years altogether without a break he gets that.

24,977. (*Viscount Cobham.*) It is a break on either side?—Yes, with notice to quit.

24,978. (*Mr. Channing.*) Has that become more usual?—Rather more usual of late since the depression, and I think it is a very good plan too. The rent may be revised every five years in that way.

Labour.

24,979. (*Mr. Chaplin.*) With regard to what you were saying about labour, have there been any improvements in labour-saving appliances introduced in recent years into your part of Scotland?—In machinery there have been, but nothing else.

24,980. The total amount of labour employed then on the farms where machinery is employed is somewhat less than it used to be?—In harvest time it is, but not generally throughout the year.

24,981. Take the farming year through there is as much labour employed, you mean to say, as there used to be in former days?—Quite.

Retaliatory duties.

24,982. In regard to your proposed remedies for agricultural depression, I observe that you suggest that what is most required is free trade all round, or something equivalent to it; what do you mean by something equivalent?—It means a great deal; I mean if we had free trade with other countries we would be able to live. We want a fair field and no favour, and if we had free trade with other countries, if other countries will allow us to send our produce to them free of duty, we would do the same to them, but unless they did so, we ought to put on a retaliatory duty.

24,983. On all the goods that are imported, do you mean, or any particular goods?—Certainly; for instance what I mentioned before. If America would permit our goods to enter its ports free we would give them the same privilege.

24,984. Do I understand what you mean is this, that where any foreign country imposes a duty upon any agricultural produce in this country being imported free that you would retaliate by imposing duties on the agricultural produce coming from those countries?—I would, should they refuse. That is my meaning.

24,985. That is your suggestion as a serious remedy for agricultural depression?—Yes.

24,986. Then, I think, you propose to deal with what you imagine might be opposition to that proposal?—Yes.

24,987. What are your views upon that point?—Well, I think there might be great objection to it amongst certain classes; I have no doubt there would be.

24,988. What classes do you refer to now?—There are many classes who would object to it; I think that the manufacturers might object to it in some way, and there are others. I have no doubt shippers might.

24,989. You say something about shippers, and if the shippers object to it, what is your reply to them?—My reply is that I do not think that agriculture should be sacrificed for other interests. I think that it is one of the largest and most important interests of the country, and I do not see that it should be sacrificed to benefit other interests.

24,990. Do you hold that is what is occurring at the present time?—I do.

Cottages.

24,991. (*Mr. Gilmour.*) You spoke of the cost of cottages. Does that mean the landlord finding the stone, and finding the lime?—The landlord finds the stone but not lime.

24,992. Do you take that into account in the calculation of the cost?—Well, the landlord gives the stone.

24,993. But the contractor quarries, and the tenant performs the cartage?—Yes. If you count the value of the stone and what the tenant carries, it would amount to something like 15 per cent. more.

Mr. A. Ralston.
21 June 1894.

Condition labourers.

24,994. With regard to the labourers there has been something said as to the improved manner in which they live, does that apply chiefly to their food, or to their style of clothes, and other matters?—More to the clothes and the food I think.

24,995. Has the food of the labourers altered much in the last 20 or 30 years?—It has altered very much for the worse, they are living more on tea, and loaf bread, whereas in former days they had good porridge and sweet milk.

24,996. Is that affecting the physique of the labourers?—I do not think that the labourers are as strong and healthy now as they were.

Leases.

24,997. You speak of breaks in those 19 years' leases, has your experience not been that that just means the end of the lease as a rule, that he wants a new agreement entirely?—No, if there is a break of the lease, and it is not taken advantage of the lease goes on, up to the natural termination.

24,998. I understand that; but at all those breaks has it not been your experience that the tenant looked upon it as an occasion to get a great deal more done?—No, because the obligation in the original lease holds good for improvements, if they do not take advantage of the break, they must abide by it all the same.

Scale of compensation.

24,999. Do you consider that a scale agreed upon in the lease, what is called a fair and reasonable agreement does not simplify very much the working of the compensation at the end of the lease?—Very much indeed. I think that it is much better than going out under the Agricultural Holdings Act.

25,000. Do you think it would be advisable to get some scale laid down varying with different districts which would be applicable to all leases given in those districts, and upon which scale compensation would be given to deal with it legislatively?—I do, and I might tell you that before the Bill was brought into Parliament some years ago, I prepared a scale of compensation for leases on Lord Strathmore's estates. I drafted out the scale, and his Lordship approved of it, and then we asked eight or nine of the principal tenants on the estate to meet Lord Strathmore, so as to compare notes over it; this scale was approved as amended by the tenants, and it is in operation just now, and they are quite satisfied; it was in fact their scale, made with some alteration to meet their views. I have never had the slightest difficulty in dealing with the tenant when he has gone out. We never change a tenant if there is anyone to succeed him.

Co-operation.

25,001. Has co-operation made any headway amongst farmers?—Not in my part of the world.

25,002. Do you consider it is possible to do away at all with the labour of the middle-man?—I think it would be a very good thing if they could.

25,003. Do you think that there is any practical mode of carrying it out so that it could be done?—I do not see any difficulty in it myself; I think it could be done.

25,004. But you have no examples to give in that part of the country?—Not in that part of the country.

25,005. Have you anything at all further to put before us in regard to helps in these times of depression?—No, nothing, I think.

25,006. No main remedy?—No remedy at all, except better prices.

The Agricultural Holdings Act.

25,007. (*Mr. Clay.*) I suppose I may say that you agree with the principle of the Agricultural Holdings Act?—Yes, to a large extent.

Scale of compensation.

25,008. And you founded the scale and you gave that to tenants upon that principle?—Our scale was arranged before the Act came into operation, and before the Bill was brought in. There was a talk about it, but it was two or three years before the Bill passed.

25,009. Was the late William Smith of West Drums one who was consulted?—No, he was not.

25,010. But he was employed?—No, he was not employed. I do all these things myself.

25,011. You made the scale yourself?—With the concurrence of one man paying nearly 3,000*l.* a year rent at the time, and all the large farmers I took into consultation.

Mr. A. Ralston. 21 June 1894.

25,012. For the guidance of the Commission can you hand in that scale?—I could; I have not got it here; I think I gave it to Mr. Hope.

25,013. We should like to have it for the appendix of this report; you will hand it in to the Secretary?—Yes.

Protection.

25,014. Regarding Protection, you say it would give (*see* Appendix) the labourer more wages if you had Protection?—That is so.

25,015. What was it in the old Protection times; did it increase the labourers' wages?—In the olden times there was not such a demand for labour as now; in the olden times there was not so much land under crop, as you know.

25,016. But you will also know that the labourers' wage then was not half what it is now?—That is owing to the demand for labour.

25,017. The wage was not half under Protection, and the labourer paid a deal more for the articles that he used for his labour in the shape of food and clothing?—I am quite aware of that.

25,018. If that were the case of Protection in the olden time, how is Protection now-a-days going to improve the labourers' wages?—Because everything has advanced so much in this country; everything has very much advanced to what it was then, and there are greater demands for labour than then. In those days a larger extent of the land in Scotland lay longer in grass; probably from a seventh to an eighth; you have two men employed now for one man employed before.

25,019. If the wheat land is going out of cultivation?—The wheat land of Scotland is a very small proportion of Scotland, a very small proportion indeed. If you take the Eastern Board of Scotland, you have practically the whole of the wheat land in the county. If you take three-fourths or four-fifths of Scotland, you will find that it is not a wheat-growing country.

25,020. You think if you had Protection, the labourers' would go up?—I have no doubt there would be much better demand for the produce of the farm.

Law of distraint.

25,021. Regarding the law of distraint, how is it to benefit the farmer?—I do not think that it benefits the farmer, the abolition of it, I mean.

25,022. Did it benefit the landlord?—Not a bit, it is a matter of no importance.

25,023. You say it sometimes made the landlord bring forward his rent 6 or 12 months?—In Forfarshire a farmer was in his farm 15 months before he was asked to pay the first instalment of the rent, and it is now taken at 6 months and 12 months; the man entering a farm now requires for the amount of his rent more capital than he did in former days.

25,024. But on the estates which you manage no change has been made in the period of collection of rents and no loss has been sustained therefrom?—Quite so.

25,025. So that the law of hypothec has not damaged you?—That is a very small portion of it. But it has prevented the ploughman and the industrious man from becoming small tenants from the fact that it would require a year's rent more to enter a farm than before.

25,026. But you have not lost under the abolition of hypothec?—There has been no loss.

25,027. Neither you, nor the landlord, nor the tenant has lost?—But these industrious men cannot enter a farm with the same capital as in former days. You are speaking of a small portion of the county; you are talking of a small portion of land in Forfarshire but I am talking of the whole county.

25,028. I am talking about your own estate?—That is a very small portion, you know.

25,029. How does it affect the general trader who supplies his goods to the farmers in the shape of cakes, manures, and grass seeds?—I am perfectly certain that the traders under the old system got their accounts as well paid as they do now, and better.

25,030. When the tenant gets bankrupt, what then? There are not bankrupt tenants; we do not know what bankrupt tenants are.

25,031. Not on your estate?—Not in Forfarshire or the east of Scotland, or in Fifeshire, very few.

25,032. We have evidence where the general trader has got a shilling in the pound for the material supplied to the farmer?—I do not think so. I think that they got their payments as well paid as now, because there were no bankruptcies.

Mr. A. Ralston. 21 June 1894.

25,033. Your estate must be a model estate?—No, I may say that the landlords in Forfarshire have done very well; they have met the depression in a very good spirit.

25,034. I grant you that. I know they have done well; but is it all over Scotland the same?—I have had considerable experience in valuing land from John o'Groats to the Tweed, and in my experience and knowledge of 15 or 20 years I can say that the landlords have met the tenants in a very fair spirit.

25,035. (*Mr. Giffen.*) I understand from you that the labourers in your part of the country are also better off than they were 20 years ago?—They are.

The depression in agriculture.

25,036. And the tenants, although they have suffered to some extent from depression, have not suffered to the extent that there are any bankruptcies amongst them?—There are no bankruptcies.

25,037. And no great changes; they still go on with their farms, so I suppose they are doing tolerably well, but not so well as they did some years ago?—They have been making the two ends meet, but I do not think they are making money; they have a fair comfortable living, but not more than that.

25,038. The landlords are still getting some rent out of the farms, and you have no derelict farms?—No derelict farms; none whatever.

25,039. Do you think that the state of circumstances such as you have described can be spoken of as depression in any proper sense of the word?—I think that the farmers are only getting their living for their labour, and that probably some of them with 10,000*l.* invested are getting very little interest, whereas in former days they got a good profit.

25,040. Still there are "ups" and "downs" in all trades, and if this is only a "down" which is to be compensated later on or has been compensated in past time when things were better, you cannot describe it as a very bad state of things?—But when depression goes on for 17 years it is a very long period. We should like to see the "ups." We have had "downs" for 17 years.

25,041. But still these are things that occur in a great many other trades?—But not for such a lengthened period; I do not think you can put your fingers on any trade that has suffered so much as agriculture has done just now.

25,042. Still you have not investigated the case of other industries?—I know that the manufacturing trade of Dundee has sometimes a deep depression, but it is only for a year or two.

25,043. But they have had great "ups and downs"?—They have, but they have good years occasionally, which make up for it.

25,044. Still I assume that you have had one or two good years in agriculture since 17 years ago?—Not certainly since 1885.

25,045. No good years?—Not what you called good years in the good old days.

25,046. But still you had years that were tolerably good?—There were years when perhaps they were earning a little interest for the money, but I do not think they were getting 4 per cent. or 5 per cent. which they ought to do in a rather critical business.

25,047. Still of the three persons interested in agriculture the most numerous class, the labourer, is doing very well?—Yes, they are doing very well.

25,048. And the next class, the smaller class, but still the next largest class, the tenant farmer, makes a living?—Makes a living by the help of his family.

25,049. So that practically the class which suffers from the depression is the landlord who receives less rent than he did before?—Well I do not see a bright spot in his future at all. The tenants who have leases may take advantage of the breaks in the leases and in consequence now they can revise their rents, and they can get their farms at a smaller rent if necessary.

The currency and reduction in rent.

25,050. What is the average reduction of rent in your neighbourhood?—The average reduction of rent in our county is about 25 or 30 per cent. Lord Strathmore's is only 22½ per cent., but his estate was always moderately rented. You must take that as a certain basis

Mr. A. Ralston. 21 June 1894.

25,051. On the other side, you have got this fact before you that the purchasing power of the sovereign has very largely increased; we have evidence before us that it is something like 50 per cent.?—Yes.

25,052. Is not the landlord who receives 30 per cent. fewer sovereigns better off than he was before, because the fewer sovereigns that he gets have more purchasing power than the larger number that he got before?—That would be very well if things would remain as they were; that is to say, if the landlord had not to spend money in improving his property; but when a man spends 27 per cent. of his annual income in improving his property, it comes to a very different thing. Take Lord Strathmore's 27 per cent. of his rental spent every year on improving his property and for which he does not receive a brass farthing; and a 22⅔ per cent. reduction that makes 49½ or 50 per cent. of his income is taken away as compared with what it was 20 years ago.

25,053. Then the reduction of rents is not really 30 per cent., but is more like 50 per cent.?—It is more like 50 per cent.

25,054. That is what it comes to?—Yes.

25,055. But even a 50 per cent. reduction the dimished money that he has received is almost equal in purchasing power to what it was 20 years ago?—I doubt it very much. I should like to see the old times with the same value of money.

25,056. Then you do not agree with the evidence which some of the gentlemen have been giving. Perhaps you have not looked at the diagrams of the great increase in the purchasing power of the sovereign?—But then take the taxes; they have increased very much. Take the 50 per cent. that I have been speaking of, and add to that 12 or 15 per cent. of rates and taxes, that is 65 per cent. off the rent.

25,057. Has the increase of rates equalled 4 per cent. of the rental?—The increase of rates and taxes will be from 4 to 5 per cent. more than it was 20 years ago.

25,058. Not 4 to 5 per cent. of the rental?—The rates and taxes amount to about 12 to 15 per cent. of the rental being from 4 to 5 per cent. more than 20 years ago.

25,059. But 12 per cent. before?—Probably 10 per cent.

25,060. However, if the reduction of rental continues in that way, and allowing for the increase in the purchasing power of money, it is not so very great upon the bare statement of the nominal reduction. These are calculations to be made?—Looking at it from that point of view, it is; but as I said before, I would rather see the purchasing value of the money the same as it was 20 years ago, and have the rents at the same.

25,061. Still that may or may not be. But we are anxious to ascertain what the real facts are?—I am not aware that it is so much as you say.

25,062. I am merely repeating the evidence given by the different witnesses?—I am not such a financier as to know that; I know it has largely increased.

Retaliatory duties.

25,063. It is upon that ground that the proposals of bimetallism and other proposals are made to raise the nominal prices again; but it is put before us that the purchasing power of gold is increased to that very large extent. And then you wish to improve the condition of things, to bring Free Trade all round, as your phrase if, by imposing retaliatory duties upon those countries which impose upon goods which we send to them?—Quite so.

25,064. Do you wish to confine that to those countries which impose duties upon agricultural produce that we send to them?—I would impose duties on all countries, confined to agricultural produce; I would let other people speak for themselves—manufacturers for instance.

25,065. Do we export agricultural produce to any country worth speaking of, taking it all round?—We export a good deal to America of both pedigree cattle and potatoes, and we export wool also.

25,066. But our exports of British wool and our exports of potatoes (I am not aware at this moment with regard to pedigree cattle), but our exports of those two things to all the world are quite insignificant compared with our general export trade?—Because they put a tariff on it to prevent it.

25,067. Are you quite sure that that is the cause?—I think that that is a very obvious cause.

Mr. A. Ralston. 21 June 1894.

25,068. But is not the real cause that we consume our own agricultural produce at home?—I know there is a very large export of wool and potatoes to America.

25,069. Do we not import potatoes into this country?—They are imported; but we grow far more than we consume in this country. Other countries send them in; but we have a greater supply of potatoes in this country than would meet the demand of Great Britain for the consumer.

25,070. Would it not be the case if the Americans required potatoes from this country that the prices in America would go up to the prices plus the duty that would enable us to send potatoes to them; that the price in America would go up to a point that it would pay us to send to them, and pay the duty as well?—Yes, considering all the circumstances that would be so.

25,071. The duty in America does not prevent the importation of potatoes to this country to any material extent?—Because we are getting so many from Germany and France and the Islands that there is no demand for our Scotch potatoes in a certain period of the year. In an early part of the year we have none and we are obliged to send them to America, when sometimes the price does not pay the import duty.

25,072. You do not propose to put an import duty on other articles?—I would leave it to the Legislature and let them find it out for themselves; I have not looked into that.

25,073. Have you considered the history of the Free Trade policy of this country, and the policy of this country with reference to this very question of retaliatory duties?—I have read Bright and Cobden when they were advocating Free Trade. They said that all the world would be Free Traders in the course of a very few years afterwards, and the result is that all the world has become Protectionists.

25,074. You are not aware that the policy of this country for many years prior to 1843 was this very policy which you recommend as the retaliatory duties?—Yes.

25,075. And that that policy was deliberately abandoned because it was found not to answer?—Well, I could fancy it would not, because you had not so many countries producing. America was not producing so much, Australia was not producing so much, and there were no facilities for bringing them in, and altogether it was different then to what it is now.

25,076. Still, the general idea was that you could compel other countries to give you good treatment as regards your exports, by putting duties upon the goods that they sent to you?—Yes.

25,077. And that policy which was tried for very many years was deliberately given up because it was found not to answer?—I am giving you my opinion and I will not draw back from it.

25,078. And you neither admit nor deny that the account I have given of the history is the correct one?—You have my opinion and I stick to it.

25,079. But you are not able to go into the question of the history of this subject?—If you were arguing for another five or six hours I do not think you could convince me.

System of cultivation.

25,080. (*Sir Nigel Kingscote.*) Has the system of management of farms altered at all of late years?—No, not much. In some parts it has; in the heavier lands, the clay lands, the tendency has been to lay them more down to grass. In the lighter lands the system has not altered a bit.

Employment of women.

25,081. Is there as much women labour as there used to be?—There is at some seasons of the year and some periods of the year. In harvest time the women are well paid, and the women get from 5*s.* to 3*s.* a day in the harvest time.

25,082. Did they get as much 15 to 20 years ago?—No quite.

25,083. Still there is a good deal of it?—Yes.

Tenant capital.

25,084. (*Viscount Cobham.*) I gather that the farmers in Forfarshire lost much of their capital?—I think they have lost a part of their capital. I think when the depression began at first and before they got their rents altered that they did lose then; I do not think they are losing their capital so much now.

Mr. A. Ralston. 1 June 1894.

25,085. You gave evidence to the effect that those applying for a renewal of their leases, got them at the same rent as before?—Yes, generally.

25,086–7. Had they the same amount of capital?—But they had capital in the bank; they had capital at that time. I think that the tenants are poorer now.

Reduced value of produce.

25,088. What has been the reduction in the value of their products?—I think now, for instance—I give an example:—Barley this year was selling about 25*s.* a quarter, and in former years it was about 36*s.* per quarter, or about 30 per cent. more.

25,089. Would you agree with former witnesses that the value of agricultural produce, generally, has fallen about 30 per cent.?—It is just about it.

25,090. Notwithstanding that and an increase in the cost of production, you think that farmers have only suffered in the reduction of their profits for the most part?—Just in their profits. I think that they are able to pay their way, but they have no profit now. They are not laying anything aside now.

Scotch and English farmers compared.

25,091–2. How do you account for their having done so much better compared with farmers in England, who have lost the whole of their capital in many cases?—They have adapted themselves to the altered circumstances in many cases. They have, for instance, in the case of the Carse of Gowrie laid down their land to grass, where the expense of labour is not nearly so much, simply a trifle on those grass farms; but, on the other hand, we have more machinery than in former days; there is a little less expense in harvesting a crop, and manures are at a cheaper rate, and not only manures but feeding stuffs are at a cheaper rate; nearly 30 per cent. in the price of feeding stuffs less than 20 years ago.

Cost of production.

25,093. Has not the cost of production on the whole decreased?—No.

25,094. Including rent?—Including rent, it is much about the same.

25,095. What has increased except the cost of labour?—The labour bill, the tradesmen's bills, and all the saddlers and blacksmiths, and all those bills have increased very much indeed. The price of coal is kept up.

Mr. A. Ralston. 21 June 1894.

25,096. But the cost of feeding stuffs and manures have diminished considerably?—That would hardly meet the reduced prices of produce.

25,097. Although the wages of labour have increased, the amount of labour has somewhat diminished?—Very little on arable ground; the number of people is the same as it was 20 years ago.

25,098. And there has been a diminution of 25 to 30 per cent. in rent?—Yes.

25,099–100. It is difficult to see that on the whole the cost of production has increased?—To a certain extent, but not so much as the bad prices they were getting.

25,101. And if the value of the products has diminished 30 per cent., it is difficult to see on paper how the farmer can live?—Well, it is only from the fact that they are getting their manures and cakes cheaper now and the abatements that they have got, that is all; and also living a more economical life than they did 30 years ago; they are living in different style altogether.

25,102. The fall of 30 per cent. in the price of products means much more than that off the profit?—In former days they had good interest for their money, and now they get nothing except their living from the farm.

Bank loans.

25,103. (*Lord Rendel.*) Have the farmers to your knowledge had recourse to the local banks?—In some cases they have, but not very much. As a rule, I do not think they have very much more than a little overdraft occasionally, but only temporarily.

25,104. Banks are not doing a large or profitable business with the farmers?—Scotch banks are averse to giving farmers loans.

25,105. (*Mr. Clay.*) They give them long credits?—With good security, Mr. Clay.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Forty-seventh Day.

Friday, 22nd June 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

VISCOUNT COBHAM.
The Right Hon. BARON RENDEL.
The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
WILLIAM CUTLACK LITTLE, Esq.
CHARLES WHITEHEAD, Esq., F.L.S.

HERBERT LYON, Esq., *Secretary.*
R. F. CRAWFORD, Esq., *Assistant Secretary.*

Mr. JOHN EDWARDS called and examined.

Mr. J. Edwards. 21 June 1894.

25,106. (*Chairman.*) You are a tenant farmer near Crewe in Cheshire?—Yes.

25,107. And you are also a member of the Agricultural Association?—I am.

25,108. Are you president of it?—No, I am not, I am simply a member. I am a member of the Cheshire County Council as well.

25,109. And you occupy nearly 300 acres, of which 150 are under arable cultivation?—That is so.

25,110. And you hold under one of the largest estates in Cheshire?—That is so.

25,111. Have you considerable knowledge of the state of agriculture?—I have.

Mr. J. Edwards. 22 June 1894.

25,112. And are you one of the members of the Cheshire Dairy Institute at Worleston?—Yes.

25,113. And you have acted as Judge at various Agricultural shows?—Yes.

Depression in Cheshire.

25,114. What is the state of things in your district?—Well, I do not think they are as bad as in some counties in England, but they are in a very depressed condition at the present time.

25,115. How long has that been the case?—During the last two or three years more than before.

25,116. How many years?—Perhaps more than that, but we have felt it more during the last two or three years.

Mr. J. Edwards.
22 June 1894.

25,117. Is that partly due to bad seasons?—Partially But foreign competition is the principal thing. We are in the neighbourhood of Birkenhead, and there is a great quantity of foreign cattle slaughtered there, and I think it is brought into our markets in the neighbourhood and sold as English, at least the question is never asked whether it is English or foreign. We do not fear the foreigners if we can meet them on fair grounds, but we think it is an unfair thing for their stuff to be sold in our markets as English, because the English consumers will always prefer English fed meat in preference to foreign if they knew it.

Foreign competition.

Reduction of rent.

25,118. But before we come to that, have rents been reduced in your district?—There has been no general reduction.

25,119. Have there been partial reductions?—There have been returns on most of the large estates.

25,120. Since when?—During the last three years.

25,121. But not before that?—Not before that. If I may say so in a few isolated cases before that, there may have been.

Demand for farms.

25,122. When farms are vacant, is there a demand for them?—Yes, there is, although we have had a few cases lately where farms could not be "set," there was only one "set" the other day as being vacant. If it had been "set" the tenant should have taken possession in May. The farm could not be "set" till lately, it has not been vacant for very long, for two or three months.

25,123. Is that an exceptional case?—That is an exceptional case.

25,124. (*Viscount Cobham.*) Is that a dairy farm?—Yes.

25,125. (*Chairman.*) Was that let at the same rent?—It was "set" at a much reduced rent, and it is taken by now.

25,126. When the farms are vacant are they let at reduced rents or at the same rents they were previously let at?—In some cases they are reduced, but, as a rule, they are taken at the same rents.

Wages.

25,127. And as to the wages of labour?—They are very much in excess of what they were, we will say, 30 years ago.

25,128. But as compared with 14 or 15 years ago, when the depression came on, what are they?—Rather more now. I should say from at least 10 to 15 per cent. more than they were 15 or 16 years ago.

25,129. What do they run now?—About 18*s.* a week for farm labourers, in some cases more.

25,130. (*Mr. Little*) Are those milkers?—Yes, the farm servants generally milk, but, as a rule, we allow them a little extra if they milk; but there are plenty getting 18*s.* per week without milking.

25,131. Milking prolongs the hours?—That is so.

25,132. (*Mr. Everett.*) Have they a cottage rent free?—Not with those wages.

25,133. (*Chairman.*) I suppose the rise of wages has been one of the difficulties of farms in that district?—Yes; it is not that altogether; it is not that that has caused the depression.

Reduced labour.

25,134. Has there been an economy of labour?—Yes, considerable.

25,135. Is the number of labourers employed rather less than it was?—Yes, it is. Where farmers have families and sons they are trying to do a deal of the work themselves to save employing labourers and to economise.

25,136. The difficulties that you have experienced have been mainly in the last two or three years?—Yes, we felt it more the last two or three years.

Importation of foreign cattle.

25,137. And that has been largely due to the competition of foreign cattle coming into Birkenhead?—That is one of the causes.

25,138. That does not, I suppose, affect the dairy farms?—It does to a certain extent, because where they keep a large dairy herd they rear a lot of calves; and during this introduction of foreign cattle, the price of store stock has gone down so much that it scarcely pays them to rear them, to sell them for feeding or anything of that kind.

Price of store cattle.

25,139. When did the price of store cattle go down?—About three years ago; it has been going gradually down for longer than that, but we felt the severe drop about three years ago.

25,140. Was it very low this last year?—Very low.

Mr. J. Edwards.
22 June 1894

25,141. That is partly due to the want of fodder in the South of England?—That I cannot tell you; I could not answer that question.

25,142. (*Viscount Cobham.*) The price of cow beef has fallen very much, too?—Yes, it has.

Quality of agricultural produce.

25,143. (*Chairman.*) Another cause you state here of the difficulty is the inferior quality of some of those articles of agricultural produce?—We are gradually improving that; there was a great deal of inferior cheese made in Cheshire, and we established a dairy school at Worleston and we are educating every year a lot of young dairy maids there, and I have known in many cases where farmers have sent their wives and daughters to learn cheese making. They have made as much as 5*l.* and 10*l.*, and even 20*l.* per cwt. and more, on their cheese after being taught there.

25,144. And you think a great improvement has been effected in that direction already?—Yes.

25,145. And still more may be done?—Yes.

25,146. By improving the quality of the produce and getting a better price in consequence?—Just so. I may say also that there is a great deal of cheese sold in the market that is adulterated, the natural fat is taken from it, and a great deal of animal fat substituted.

Cheese factorie

25,147. Are there cheese factories in your district?—Not exactly in my district.

25,148. The cheese is all made on the farms?—It is all made on the farms. I do not know of any factories in Cheshire.

25,149. You have no cheese factory or butter factory?—I think not.

25,150. It is all made on the separate farms?—They are made on farms, they are trying to establish factories at the present time in my neighbourhood.

25,151. They are trying to do it?—Yes.

25,152. Do the farmers think that some advantage may be derived from them?—Well, that is what they are trying to do, although years ago I have known the factory tried in Cheshire. Some 20 or 25 years ago there was one at Crewe, but it did not appear to succeed very well then; but perhaps they may have more experienced teachers now than they had then.

Rent.

25,153. What rent do you pay?—30*s.* per acre.

25,154. There has been no reduction of that?—No; it was a little more, but my landlord has reduced it.

Expenditure on improvements.

25,155. You have had yours somewhat reduced, how much?—The rent I paid was 450*l.* and the landlord took 30*l.* off and has given me other privileges. I may say one thing that you should clearly understand that we have no fault to find with our landlords in Cheshire. They endeavour by every means in their power to assist their tenants by giving them improved buildings and improving their houses and making them more suitable for dairy work.

25,156. Has there been a good deal of expenditure in that direction?—There has.

25,157. More during the last few years than previously?—There has on some estates. On the estate I live, that is the estate of Sir Henry Delves Broughton—it is one of the largest in Cheshire—they are making great strides. Lord Tollemache and Lord Crewe and Colonel Jodrill are the other principal ones in our neighbourhood and they are setting a very good example in doing their best for the tenant farmers in the district.

25,158. They have met the difficulties of their tenants by spending money?—Just so, and in many cases they have made returns at their rent days.

Rates.

25,159. Have your rates been increased?—Yes; that was a thing I should like to speak of. I commenced farming about 1866. My rates at that time were 1*s.* 6*d.* in the £ for the year, and to-day they are 2*s.* 6*d.* for the year. There were two of 9*d.* in the £ then, and to-day there are two fifteen penny rates in the £.

25,160. What has that been due to?—I cannot attribute it to anything else unless it is the state of bad trade and so many of the lower class out of employment. The labourer is not so efficient, and old labourers have to take refuge in our workhouses.

25,161. Has the poor rate increased?—It has.

25,162. In the same proportion?—In the same proportion. We have had the poor rate and the highway rate collected altogether.

Mr. J. Edwards.
2 June 1894.

25,163. But I mean that part of the poor rate which is specially due to the maintenance of the poor?—That has increased very much.

25,164. What is your union?—Nantwich Union. I may say that I am vice-chairman of that union.

25,165. Are there several towns in the union or are you purely an agricultural district?—The union, as a rule, is agricultural with the exception of the towns of Nantwich and Crewe.

25,166. Is the increase of rates due to the towns being in the union, do you think?—I think it is. But still at the same time we must not blame the towns altogether for a good many of the poor people out of the country being men who went to the towns, especially the town of Crewe, have gone to get employment and they have settled in the town of Crewe.

25,167. (*Mr. Little.*) There is a good deal of expenditure for sanitary purposes: water, for instance?—Yes; but that is, as a rule, a separate charge on the different townships, and many of the landlords have guaranteed any deficiency if the water rates did not bring in sufficient to pay the loans.

25,168. (*Chairman.*) Are there school boards in your union?—Some, but a great many voluntary schools.

25,169. In your parish what have you?—My parish has a voluntary school.

25,170. You have no rate, therefore?—There is no rate. It is conducted on voluntary principles. We find it rather cheaper for us to conduct it on voluntary principles than by school boards.

25,171. Then you think that the charges on land in the shape of rates ought to be reduced?—Yes, I think that they are unfair in one sense. The charges for the maintenance of the roads, I consider myself, and it is the opinion of my neighbours, are rather unfair. For instance, take a tradesman with four or five conveyances and perhaps six or seven times on the road every day, whilst a farmer would have perhaps one conveyance every day. The tradesman may be rated at perhaps 100*l.* and the farmer at perhaps 400*l.* or 500*l.* Of course, we in Cheshire consider that a van and wheel tax would be a very fair tax.

25,172. In aid of the highway rate?—In aid of the highway rate.

Adulterated cheese.

25,173. Have you anything to complain of as to the sale of adulterated products?—The reason I mentioned that was in reference to so much cheese being adulterated with animal fat and sold as natural cheese in our markets. As I said before, we do not fear competition if we have fair play. There is another matter I might mention also that the depression does not exist exactly on all the farms in Cheshire. On those large estates as a rule it has been the son to take his father's farm; it has generally passed to the son and the rent often has not been altered. But where a farm has been at liberty and it wanted a fresh tenant the rent has been put up a good deal. Of course, where there is so much competition I do not see how you can blame the landlords particularly. Between 1860 and 1875 to 1880 farming was very good and there was a good deal of competition for farms, and some people were foolish enough to take farms at ridiculous rents, and it is on those farms I consider that the depression exists more than where there have been old tenants.

Depression in Cheshire.

25,174. (*Mr. Chaplin.*) Were they taken on leases in those cases?—No, generally on yearly tenancies.

Rent.

25,175. (*Viscount Cobham.*) Did not the rents fall about the time of the cattle disease?—Not very much.

25,176. They recovered again afterwards?—They recovered again afterwards. I may say that the price of all kinds of agricultural produce to-day is lower than in 1840 or 1845, very much lower. If the lands as a rule let at rents they were let at then, I do not think we should hear anything of the depression in Cheshire except a few might complain about the drop in stock that I spoke about before.

25,177. (*Chairman.*) What do you make your main profits from yourself, is it the sale of cheese?—Cheese and potatoes for the markets in the neighbourhood.

Price of cheese.

25,178. Have you got any table of prices of cheese extending over some years?—I have not. We have had several fairs in our two towns within the last month, and the prices ranged from 40*s.* to 60*s.*, a few shillings over that and a few perhaps better, but the average price is 50*s.*

25,179. How does that compare with a few years ago?—It is about the same that it has been during the last two or three years.

Mr. J. Edwards.
23 June 1894.

25,180. But 14 or 15 years ago?—It was very much better sold then. I have been a dairy farmer over the last 26 or 27 years, and I have sold cheese at 80*s.*, and I have also sold it at as low as 45*s.*, and I have got 45*s.* to 60*s.* per cwt. during the last two or three years; but I may say that was very early cheese, and was not quite up to the mark. As a rule, the price of cheese in 1874 was about 80*s.* for good cheese; the same class of cheese to-day is worth about 60*s.*, perhaps, the best cheese.

25,181. I think the depression began two or three years ago?—Yes.

25,182. And up till then was the price of cheese maintained?—The depression began two or three years ago, when the price of stock went down more than anything else.

25,183. It was not so much due to the cheese as to that?—It was not so much due to the cheese as to that, and the price of all sorts of agricultural produce went down.

Large and small estates.

25,184. Have you formed any opinion as to the desirability of large estates or small ones?—We find that, as a rule, the tenant farmer has quite as good a chance under large estates as under small estates, because the landlord has more means in his power of assisting his tenants. We find all the large estates managed well in our neighbourhood, whilst I may say that I have nothing to say whatever against the small estates.

25,185. But, on the whole, the owners of large estates are better able to meet the wants of their farm tenants by expenditure?—I think so; that is my own opinion.

25,186. And is there rather a preference to take holdings under a large owner than a small one?—I should prefer to take a farm under a large owner myself.

25,187. Are there many farmers occupying their own farms?—Not very many; a few.

Judicial rents.

25,188. Is there any desire of farmers in your district to have their rents determined by independent authority?—I do not hear anything of that sort. There are a few who are of that opinion. I may say 90 per cent., or more than that even, are quite satisfied by making their own arrangements with their landlords.

25,189. Has the matter been discussed at your association?—Well, it has been mentioned; but it has not been discussed at any length.

25,190. Was it not treated as a practical question?—It was not.

The Agricultural Holdings Act.

25,191. Then on the subject of the Agricultural Holdings Act, have you had any discussions upon that?—Yes, we have. But the Agricultural Holdings Act cuts both ways. I do not think that it has been so much used; it has certainly helped in some few cases, but it cuts both ways, and, as a rule, I do not think it is of very much advantage to the tenant farmer.

25,192. Have your association any amendments to suggest?—No, we have not, not that I am aware of. I am not president of any association; I am simply a member of the Cheshire Chamber of Agriculture.

Subdivision of farms.

25,193–4. Is there anything else you wish to bring before the Commission?—I think it a great mistake for landlords to destroy small farms to make large ones. I really think if there were more small farms in the country it would be very much better.

25,195. Has there been much movement in that direction?—Not of late years, not very much; but I find that farms of, I will say, 100 or 150 acres are, as a rule, quite as well managed as the larger farms. Of course there are a few energetic men who manage large farms very well, but where there are smaller farms the farmer has a better chance of doing a great deal of the labour by his own family.

25,196. You think it an advantage to the district that there should be a number of small farms as well as large ones?—Yes.

25,197. That there should be a gradation—to have small farms as well as large ones?—Yes.

25,198. (*Mr. Chaplin.*) You are speaking of dairy farms?—Yes.

25,199. What is a large dairy farm?—Perhaps I should call a farm of 400 or 350 acres a large farm.

Mr. J. Edwards.
22 June 1894.

Small farms.

25,200. (*Chairman.*) And what is the smallest farm a man can manage and live wholly by?—There are plenty of farms of 50 acres and 100 acres on Lord Crewe's estate. Many farms of 100 acres.

25,201. Are there many smaller farms?—Yes, of 50, 60, 70, and 100 acres.

25,202. Can a man make a good livelihood out of 50 acres?—Of course they do that, but they will have to do a great deal of the work themselves.

25,203. (*Viscount Cobham.*) Do they pay the family wages?—They rear them and try to start them in life; they do not pay them any fixed wages.

Security of tenure.

25,204. Do you feel that you have much security for the money you have put into the farm under the present system?—Yes.

25,205. Even in case of a change of ownership?—Yes, if from father to son on the large estates we feel satisfied with that.

25,206. You feel satisfied with the present position in fact?—Yes.

Agricultural education. Dairying.

25,207-8. Will you tell us what the county council have done in providing special instruction in dairy-work?—They have offered a scholarship to farmers' daughters or anyone else to be taken up at the Dairy Institute for eight or ten weeks, where they can have free residence and instruction there for eight or ten weeks at a time.

25,209. Who founded the school?—The county council. To begin with, it was a farm taken up as a private adventure by a few gentlemen in the neighbourhood. They established it as a dairy school, and they charged for instruction, and the county council came into operation and took it over from this body and established it on rather a larger scale.

25,210. It is wholly maintained by the county council?—Yes.

25,211. They charge fees?—We charge fees of 10*s.* per week with maintenance, but not for those who get the scholarship; we give them free maintenance.

25,212. How many are receiving instruction at the school?—I should say about 20 weekly; there might be sometimes a little less. I am one of the managers.

25,213. Do you know the amount of money allocated to the school by the county council out of the grant?—Well, it varies. We have had as much as 500*l.* a year from the county council, and we have had a little less. I think this year we are asking for 300*l.*

25,214. For the school exclusively?—Exclusively.

25,215. Is anything else done for the promotion of farming?—Yes, during the winter months we give two sets of scholarships to farmers' sons; that is, they have to pass a preliminary examination. We instruct them in butter-making and chemistry and the general principles of farming.

25,216. Where is the instruction given?—At the Dairy Institute, but during the time the male students are there we have no female students. Of course it is devoted to the instruction of female dairy-work and male students in the winter.

25,217. Have you any instructors going about the county?—I was going to say that in the winter months we have an instructor in agriculture resident at the institute, a male instructor, and three lecturers lecturing on agriculture in the county. We have the county divided into districts, and each takes a district and delivers working lectures weekly at each centre.

25,218. Are the lectures well attended?—They are moderately well attended.

25,219. By the farmers themselves?—Yes, they are. I do not think they are so well attended as they might be, but still they are taking more interest in them than formerly. We have likewise lectures on poultry keeping, and also on fruit culture and bee-keeping and the diseases of fruit—the insect pests and matters of that sort. We have them delivering lectures in different schools.

25,220. By whom are the lecturers provided?—By the Technical Education Committee.

25,221. How are they engaged?—We have a committee partially composed of members of the county council, and we have a few large farmers who have a share in the management also that are members of the subjoint committee, and they are elected by them yearly. The appointment only stands for a year, and we are re-elected then at the end of 12 months.

Mr. J. Edwards.
22 June 1894.

25,222. Have you found much difficulty in finding competent lecturers?—No, we have not; and the market is getting better stocked with them now than formerly. I may say that we have also given the teachers of the public elementary schools lessons at different centres to instruct them in the principles of agriculture, and they have passed very successfully as teachers of agriculture in the Science and Art Department; and now they are holding classes in different parts of the county themselves. These are the people that have been taught.

25,223. And they are teaching the principles of agriculture at the elementary schools?—Yes, at the elementary schools; but still they do not hold it in the school-hours, it is held in the evening.

25,224. Is not there a grant made for agricultural teaching?—There is, we give grants.

25,225. I mean a Government grant?—I do not know of anything of the sort.

25,226. So, on the whole, you value highly the instruction provided by the county council?—Yes, we are doing the best with the money, and we are trying the matter of the agricultural instruction of Cheshire in the proper manner.

Butter-making.

25,227. Is there much butter made for sale?—Yes, a good deal.

25,228. Has there been an improvement in the manufacture of butter?—Yes, of both cheese and butter. We give instruction in butter-making at the Dairy Institute as well as cheese.

25,229. Have you more foreign butter sold in the county?—Yes, there is a good deal; we do not find fault with that of course; it is very necessary that the marking of margarine should be strictly carried out, and I think that it is moderately so.

25,230. But the home-made butter holds its own with the foreign made butter?—We do not fear the foreign butter in our markets at all.

Agricultural education. Dairying.

25,231. (*Mr. Whitehead.*) Where is this Dairy Institute situated in the county?—At Worleston, near Nantwich.

25,232. Would that be central?—It would be moderately central, that is on the line between Crewe and Chester.

25,233. Has the county council a travelling dairy as well?—They send professors in cheese-making to the different farms in the county to hold classes to teach dairy-work, using the farm-houses.

25,234. Which does the same kind of work as the travelling dairy?—They simply send the teacher and use the farmer's utensils and instruct him in cheese-making.

Adulterated cheese.

25,235. Were you speaking of English cheese or foreign cheese when you spoke of adulteration?—I am afraid both, but not in Cheshire; I do not think there is anything of that sort in Cheshire.

25,236. With what is English cheese adulterated?—I only speak of the fact; there is no adulteration of cheese on English farms.

25,237. Where would it be, then—in the cheese factories?—That I cannot tell—whether it is made in the cheese factory I cannot tell. I am informed there has been a good deal of cheese adulterated, but I suppose it is more foreign than English. I am informed, but of course I have no authority for saying so, that there is much of this sort of thing done in England.

25,238. There is a great adulteration of cheese in America, but it is the first I have heard of cheese being adulterated in England. It is adulterated, I think, with cotton seed oil?—So I believe; and it is brought into the markets; and this ought to be marked as to what it is.

25,239. Adulterated cheese ought to be marked?—Yes.

Demand for farms

25,240. You were going to give the reasons why farms are taken up as you said?—I am glad you named that. The reason is that many farmers keep their sons at home to assist them in farming, and they have really when they have begun to start in life no occupation to go to except farming, and that is the reason I consider that the farms are taken up to a certain extent. Farmers' sons might go out more than

they do into other businesses; but, as a rule, they are attached to their homes, and their country, and they have been at home with their fathers, and they are anxious to continue in the county in the same business.

Effect of the depression.

25,241. Farming in your district, I gather from you, has not been such an unprofitable business altogether on the whole?—It has been this last year—for the last two or three years—as I told you.

25,242. But not previously?—Not previously.

25,243. You think that farmers have lost more than their profits?—Yes.

25,244. Through their cattle?—They have.

25,245. Are dairy farms, grass farms rather, always more lettable?—Yes.

25,246. That is another reason why farms are taken up in your district, I take it?—I do not think there are 90 per cent. of the Cheshire farmers farming at a profit to-day.

Rates.

25,247. You speak of the poor rate being increased in your district; is not that quite an exceptional circumstance; has it not decreased as a rule throughout the country?—That I cannot say—I speak for my own union—it has in my own union increased very much.

25,248. The poor rate proper?—The poor rate proper.

25,249. In spite of subventions from the Government, as to the payment of officials, and so on?—Yes.

25,250. In spite of that?—Yes.

25,251. You are keeping the poor rate clear from the highway rate?—Yes.

25,252. Is it from want of management on the part of the guardians?—No, I do not think it is that; we are as strict as we can possibly be, both with what we call the tramps, and we also do justice with our poor in the house. Still, in spite of everything the rates have gone up.

25,253. A natural increase in the poor rates?—Yes.

25,254. Do you say notwithstanding that the labouring classes are better paid?—They are.

25,255. Would they be better off than ever?—I believe they are better off to-day than they have been for many years past, because the price of provisions is so very cheap.

25,256. You are aware that there are subventions from Government with regard to highway rates at present, towards main roads?—I was not aware of that.

25,257. Subventions towards maintenance?—Yes. I may say that I am a member of the Main Roads Committee of the county council; but I was not aware of that.

25,258. But there are certain funds allocated towards the maintenance of roads, I think; perhaps not specially, but they are allocated for roads by some county councils?—Yes. I do not know if you refer to the money that we receive from the Government from the license duties.

25,259. Certainly not?—That is wholly devoted to technical education.

Effect of the depression.

25,260. (*Mr. Clay.*) You were saying that farmers had had no income for two or three years?—For three years. Well, I feel sure I have not been able to make money.

25,261. Do you think they have been losing their capital?—They have been losing their capital.

25,262. And has the fertility of the land been going down for want of capital?—I do not consider that the fertility has been going down.

25,263. It is mostly grass land?—It is chiefly grass land.

25,264. Have you as much cake upon your land as formerly?—Yes, a good deal; but we apply, I may say, a good deal of bones to our land. I do not say but what if things continue in their present state that it will not go down eventually, because the farmers have not the money to lay out.

Payment of compensation.

25,265. If a tenant leaves his farm as an out-going tenant does he get compensation for the bone and cake?—Yes.

25,266. Under private agreement?—Under private agreement. I may say that I have had to deal with settling matters of this sort several times. I always find the landlords very fair in the matter.

25,267. If the landlord has a certain clause in his lease he will give compensation?—Yes.

Mr. J. Edwards. 22 June 1894.

25,268. You do not apply the Agricultural Holdings Act?—Yes; we do to a certain extent, of course; but the Agricultural Holdings Act only comes in where the landlord and tenant cannot agree, and I have never seen a case where the out-going tenant has not been fairly treated. There have been cases in Cheshire no doubt; but they have not come under my immediate notice, I may say.

The Agricultural Holdings Act.

25,269. Are you acquainted with the working of the Agricultural Holdings Act?—Yes; I am.

25,270. And you admit the principle of it?—The principle is right, no doubt; but I have known several cases where a farmer has applied for the cost of bones or cake upon the land and the landlord has brought in a claim for dilapidations; and that is the reason that I think that taking it altogether the thing cuts both ways. It may work well in some counties, and it works well enough in Cheshire, no doubt; but I wish it to be clearly understood that we are always treated very fairly in Cheshire. I was brought up to farming in Cheshire, and I have never had any fault to find with the landlords.

Condition of cultivation.

25,271. You have said that the farms are keeping up their fertility, and the condition of the land is maintained?—To a certain extent, but I am afraid it will not be for long.

25,272. But at the present time you say that it is?—Yes.

25,273. And where do the dilapidations come in, then?—Under our agreements we are supposed to keep the farms in a moderate state of repair, the landlord finding the material for the repairs and I do not know what—you are supposed to keep them in order, and the landlord to find the materials; and there are different things, such as gates to be kept up, and I do not know what else in proper order, such as fences kept in good condition. The landlord would claim for allowing tillage land to get dirty, full of weeds and couch grass.

25,274. Is not the farmer to blame if he does not keep them up in good condition?—He ought to keep them up, no doubt, but during the bad times it is difficult for him to pay for the labour to do it in many cases, and they have gone out of repair in many cases. I consider the land quite as well farmed in Cheshire as in any part of England, I have been in different parts; I came from Crewe up to London yesterday; and I think that the land in Cheshire, from what I can see, looks as well as any part that I saw.

25,275. If the tenant gets the steading into bad repair, the landlord is entitled to compensation?—That is why I say that it cuts both ways. If the landlord and tenant cannot agree, it is a fair thing to fall back upon.

Butter and cheese making.

25,276. (*Mr. Gilmour.*) The want of uniformity in butter and cheese in this country is the chief difficulty in competition with the foreigner?—Yes.

25,277. And is not uniformity in these products likely to be more easily obtained on large farms than on small ones?—No. I cannot see that there is more uniformity on large farms than small ones. The reason that I mentioned small and large farms is this. I do not think that on very large farms the occupier can pay the same amount of personal supervision to the work that a small farmer can on a lesser farm.

25,278. But the rents of these larger farms are as well paid as on the smaller ones?—Certainly. I do not hear any complaint about that.

25,279. Then it would be for the benefit of the whole countryside to be able to compete with butter from abroad, the Danish and other butter. But you still think it is a good thing to advocate the increase of these small farms?—It would be rather a difficult question for me to answer, but what I have said is that, as a rule, I find small farms better managed, or quite as well managed, as the large ones; though as regards the competition in butter and cheese of the small farms as compared with the large ones I do not think there is anything new to be said, because the cheese would be equally well made on the large farm as on the small one.

25,280. The question is is it equally well made on the small farm as on the large one?—That is so.

25,281. I wanted to know how long you wanted to keep the learners at the dairy school?—Eight weeks

Mr. J. Edwards.

22 June 1894.

we have them. Those are the scholarship pupils. The person who comes to learn cheese or butter making can stop as she likes, as long or short.

Cheese-making.

25,282. (*Mr. Little.*) You spoke of the prices of cheese having decreased very considerably. How many hundredweight do you produce per cow?—It varies on different farms. On a light land farm perhaps 3½ cwt. On a stronger land farm, that is purely adapted for dairy purposes, and well boned, I have known as much as 4½ and even 5 cwt. But the 5 cwt. is in very extreme cases.

25,283. How many cows can you keep on a hundred acre farm?—There is a difference there in the quality of the two farms, but, being adapted for dairy purposes, I should say about 30 cows on a hundred-acre farm.

25,284. On the average 100-acre dairy farm?—Yes, but if a light land farm, and not exactly adapted for dairy work, a few less, perhaps 25 cows.

25,285. Is it possible to largely increase the output?—Yes.

25,286. By boning?—There is no doubt about that.

25,287. And is the quality of the cheese equally good when the production is increased?—I think so.

25,288. There is no fear of diminishing the quality by forcing the production?—I think not.

25,289. Under good management? — Under good management I think not.

25,290. Has the produce increased, or has it been falling off?—Do you mean as a whole?

25,291. Of late years, say the last 10 or 15 years with the average cow, or average farm, has the produce been as much or more?—I think it decreased in production last year.

25,292. Has there been any tendency to go from cheese-making to butter-making?—I think not.

25,293. You mention that on a small farm of 50 acres or thereabouts, they can make as good cheese as on large farms?—I have no doubt about it.

25,294. You think that the personal supervision is a great element in the quality?—Yes; you may be quite aware that the farmer's wives nearly always make the cheese, or they superintend it whilst being made.

25,295. There must be a sufficient quantity of milk to make a cheese within a certain time, but within those limits you think that the small holder makes it as well as the large holder?—Equally so.

25,296. Do you hold under an agreement; I think you said you did?—I do.

Payment of compensation.

25,297. Does that agreement specify the compensation to be given for bones and such matters, or does it leave it to the Agricultural Holdings Act?—The agreements of late years have been altered, and it is left no doubt under the Agricultural Holdings Act. We had agreements before in which it was stated compensation should be given, but the agreements are altered since then.

Restrictions on cultivation.

25,298. And I suppose you have covenants to mow particular lands, or do you mow whatever you please?—As a rule the landlords can see when a farmer is farming well, and they do not restrict him.

25,299. Then it is not laid down in your agreement that you could only mow certain pieces of land?—That is so.

Depression in Cheshire.

25,300. (*Mr. Chaplin.*) You told us, at least I gathered that is your evidence, that the depression in Cheshire is not so severe as it is in many other parts of the country?—There is no doubt about that.

Reduction of rent.

25,301. And since it begun, within the last two or three years, considerable reductions all round have been made?—I cannot say that it is not a universal reduction, but there have been returns at the annual rent days, or half-yearly rent days.

25,302. They are what we should call remissions?—Yes, remissions.

25,303. Have there been cases where those remissions have been treated in the permanent returns?—Not that I am aware of.

25,304. But since the depression began to be severe two or three years ago, there have been considerable remissions?—There have been.

Condition of cultivation.

25,305. I think you are of opinion that farming in Cheshire at the present time compares favourably with what you see in some districts of England—you think the condition of farms is better?—Yes.

Mr. J. Edwards.

22 June 1894.

25,306. And the management of them is still good?—Yes.

Demand for farms.

25,307. I understood you to say that in spite of the depression the farms are still readily taken up, and you gave us the reason for it, but I did not catch it?—The reason that I gave that they were taken up, was that farmers, as a rule, in our dairy farms keep their families to assist them in the working and management of the farm, and they have really no other occupation. They have been brought up as farmers, and they want to follow the occupation to which they have been brought up.

25,308. And consequently there is a demand for farms wherever there is one vacant?—That is so.

25,309. Did you tell us what kind of agreement you held under yourself? Do you hold your farm under the Agricultural Holdings Act, or agreement with the landlord?—I suppose it would be both. I signed an agreement with my landlord.

25,310. But for anything not mentioned in that agreement you would be able to claim under the Agricultural Holdings Act?—Certainly.

Land courts.

25,311. I think you told us that 90 per cent. of the farmers in Cheshire, as far as you are aware, would certainly not be in favour of land courts, or anything of that kind, for fixing of rent?—I did not say that they were in favour of that. There are only a very few who are in favour of that sort of thing. I do not say whether they would be in favour of it or not, but I do not think that they care about it; I think that they are satisfied with their agreements, and with their landlords, as a rule.

25,312. That is what you meant when you spoke of 90 per cent. of the farmers?—That was so. In fact, I do not think there are 5 per cent that trouble themselves about the land courts; there are a few but very few.

25,313. Should I be right in saying that, as far as you are aware, there is no strong feeling in Cheshire among agriculturists in favour of great changes in land tenure?—That is so.

Agricultural associations.

25,314. We have been told by some witnesses that we have had before us, of two associations in Lancashire and Cheshire; one called the Lancashire Federation of Tenant Farmers, and the other called the Tenant Farmers' Association. Does the Cheshire Chamber of Agriculture belong to either of those associations; is it affiliated with them?—It is affiliated with the Nantwich Farmers' Club I think. I am a member of the Cheshire Chamber of Agriculture, but not of the other associations you speak of.

25,315. And you are not sure whether the Cheshire Chamber of Agriculture is associated with them or not?—Not with the other associations. The Nantwich Farmers' Club was affiliated, I believe, with the Chamber of Agriculture. I do not know whether I should be right in stating it, but I think the landlords have been the backbone of the Cheshire Chamber of Agriculture, and I do not think they were much consulted in the matter.

25,316. But the Cheshire Chamber of Agriculture is not affiliated, I understand, as far as you know with the Lancashire Association?—No, it is not.

25,317. Are you acquainted with the general views which are held by that association?—I am not.

25,318. You cannot say whether they represent at all the views of the farmers in Cheshire?—I cannot.

25,319. Apparently you do not attach very much importance to the subject yourself?—I do not, indeed.

Land Courts.

25,320. I am right, then, I think, in interpreting your opinion to be this: that as far as you know from the practical farmers in Cheshire, they have been generally in favour of making their own arrangements with the landlord?—That is so.

Restrictions on cultivation.

25,321. Have you anything to say upon the question of freedom of sale of produce or freedom of cropping your farm as you please?—All that I can say as regards that is that they do not restrict us particularly in Cheshire. There may be some exceptions in some fields that are very public near the highways, where the landlord prefers them down in grass. We are restricted to a certain amount of tillage on the farms; generally one third to take in tillage in the usual

Mr. J. Edwards.
22 June 1894.

course of tillage on a four course system; but where a tenant is farming really well, the landlord does not interfere with him if he goes to him and asks, "Will "you allow me to plough such and such a field," the landlord has always been willing to give his consent.

25,322. Where you find that you want to make an alteration in your mode of farming which is for the advantage of yourself as well as of the farm, you find no difficulties as far as the landlord or agent is concerned?—I do not.

Law of distraint.

25,323. Will you shortly give us your views with regard to the law of distraint?—I mention that in the paper I sent. I think it is unfair that a landlord should distrain for more than 12 months' rent.

25,324. You think that the law should be retained as far as 12 months is concerned?—Yes, as far as 12 months is concerned. There are a few farmers in Cheshire that I know who have been industrious men, and have perhaps been among the most successful farmers in the county, who have risen from the ranks, and I am afraid that if the power of the landlord was done away with altogether it would debar those men from rising in the world.

25,325. You think that the law of distress is a distinct advantage to the small man who begins farming?—Yes.

25,326. And its abolition would be injurious to him?—I think it would.

Cattle disease.

25,327. Do you remember the period when the cattle plague was so bad in Cheshire?—I just remember it. I should be a young man at that time.

25,328. Have you suffered since then at times from pleuro-pneumonia?—We have not had much of it since then.

25,329. Have you any views with regard to the Contagious Diseases Acts, relative to animals, which you would like to put before the Commission?—I do not know that I have, we are satisfied with the present arrangement. Of course you only refer as regards cattle.

Slaughter of foreign cattle.

25,330. I am referring to the case of pleuro-pneumonia, and to a proposal which is sometimes made, that for the future the slaughter of all animals coming from foreign countries should be made compulsory at the port of debarkation. Do you think that that ought to be compulsory or do you think that it should be left to the discretion of the authorities?—I think it should be left to the discretion of the authorities. If there was any pleuro-pneumonia in the country they came from, they ought to be slaughtered by all means at the port.

25,331. You are not in favour of compulsory slaughter absolutely?—No, I am not.

Foreign competition.

25,332. What in your opinion is the main cause of the depression from which agriculture is suffering?—The principal cause as I perhaps stated before is this matter of the sale of foreign stock in our markets against home produce. I know that there is beef brought over slaughtered at Birkenhead which can be bought in carcases at 4½*d.* to 4¾*d.* per pound, and it is impossible for the Cheshire farmers, or any farmer to feed beef here at that price. But at the same time if this meat was fairly put on our markets and labelled as American meat, as a rule the consumers would prefer to buy Cheshire or English beef, even if they gave a little more for it.

25,333. The main cause of the depression is the fall in the price of meat. Do you think that that would be remedied to some extent if the American meat were labelled and sold as what it is, and that that would raise the price of English meat?—Yes, we are not afraid of the Americans when they are fighting on fair grounds, but they take advantage of us by selling a great deal of their stuff in our markets as English produce.

25,334. The English produce you consider being better than the American?—Yes.

25,335. And in that way they get an unfair advantage over you?—Yes.

Agricultural associations.

25,336. (*Mr. Chaining.*) With regard to the question asked you by Mr. Chaplin as to the Cheshire Chamber of Agriculture being affiliated to the Lancashire Federation of Tenant Farmers and Cheshire Farmers' Association—are you not aware that all the county chambers of agriculture are affiliated with the Central Chamber of Agriculture?—I am aware of that.

25,337. And that is the only association with which they are affiliated?—I am not aware that the Cheshire Chamber of Agriculture is affiliated with this association. I know that it has been affiliated with two farmers' clubs, the Nantwich and another.

Mr. J. Edwards.
22 June 1894.

25,338. It would probably be that these local clubs are affiliated with the Cheshire Chamber of Agriculture; that would be the more important body of the two, the chamber of agriculture for the county?—Yes.

25,339. I understand that you came here not as representing any of those farmers' associations?—No.

25,340. You are here as a member of the Cheshire Chamber of Agriculture?—Yes.

25,341. Do you think that the Chamber of Agriculture fairly represents the opinions of the farmers of Cheshire?—Yes, I think that as a rule they do; I cannot say of course. You see the members of the Chamber of Agriculture do not represent the thirtieth or fortieth part of the farmers. I could only speak as a rule as to what is discussed at the Chamber of Agriculture.

25,342. You think that it fairly represents the opinion of the farmers in the county?—Yes.

25,343. As a sample of opinion?—Yes.

Boards of arbitration.

25,344. In connexion with the recommendation of that chamber sent to the Central Chamber of Agriculture as to the amendment of the Agricultural Holdings Act, do you approve yourself that there should be a board of arbitration in each county to settle all differences between landlord and tenant?—I have nothing to say against it particularly. I would rather you would not ask me my opinion upon that question, for the reason that I mentioned before, I was not present when that resolution was passed; but it might be a good thing; at the same time I do not see the necessity for it.

Compensation for consumption of home grown corn.

25,345. Do you approve that there should be compensation for home-grown corn consumed on the holding under reasonable conditions?—Yes.

Security of tenure.

25,346. Do you approve of giving, as an amendment of the present Agricultural Holdings Act, better security of tenure?—Well, we have a security, I think.

25,347. You do not think your chamber justified in asking for more security then?—Well, of course I am only one member of that chamber, and I was not at the meeting when that was passed. I have no opinion to give on that matter.

Restrictions on cultivation.

25,348. Then again do you think that there should be greater freedom of cultivation?—We have all the freedom we desire.

25,349. And there should be free sale of produce without detriment to the land. But you do not wish to express an opinion upon any of these things?—As regards the sale of produce, as I said before, I do not know that we are restricted in the sale of produce. Of course there is a clause in our agreements restricting, we will say, the selling of certain things, but of late years they have not taken any notice of that, and all that a farmer has to do is to name it to the agent, which we generally do.

25,350. You think that farmers ought to be entitled to sell hay and straw and other crops that it may be their interest to sell under the present conditions of agriculture so long as they make a sufficient manurial return to the landlord?—Yes, certainly.

25,351. And you agree to some of the recommendations of the Cheshire Chamber to which you belong, but you decline to express an opinion as to others?—That is so, I have heard the question of the Board of Arbitration spoken of by several farmers, but I have heard no definite opinion given.

25,352. I think you do not make any serious objection to it yourself?—No, I do not make any objection to it.

High rents.

25,353. (*Captain Owen Thomas.*) I think you said that some farmers had taken their farms 10 or 15 years ago; are they paying very high rents?—Yes.

25,354. Would you say they are paying exorbitant rents?—In some cases.

25,355. How are those farms let, by tender or otherwise?—No the landlord as a rule fixes the rent for a farm and chooses his own tenant, on the largest estates.

25,356. What rents are those tenants paying, what is the average?—Some are 2*l.* and some over that per acre?—Yes.

Mr. J. Edwards.

22 June 1894.

25,357. I think you said you were paying 30*s.* an acre?—Yes.

25,358. Is your land as good as their land?—Well, I should scarcely think it was in many cases; but still some land is no better than mine, where they are paying 2*l.* and perhaps not so good.

25,359. Are those men satisfied with the rent they are paying?—They are not satisfied; but they know that if they give them up perhaps someone else would take them, and they do not like to leave.

25,360. They have applied for a reduction?—Yes, and in some cases they have got it.

25,361. And those who have got it, are they satisfied?—I should say so.

25,362. What about the others, are they still paying more rent than the land is worth?—Yes, I am afraid so in some cases; as I said before in the early part of my evidence, it was some of those farms that will let for 40*s.* or 50*s.* up to 60*s.* per acre; it was those farms where the depression was most felt.

25,363. What are those men to do if their landlords refuse to make any deduction?—Well, they will have to farm as long as they can, and they will stick to it as long as they possibly can; and if they cannot farm any longer they will have to give it up.

25,364. Where would they go afterwards?—They will have to take anything, a smaller farm perhaps, or occasionally they come to grief and have to take what they can get.

Cattle breeding.

25,365. What do they do with their calves?—We sell them in the market; feed them for a few weeks and sell them to the butchers, and some we rear. We always have to rear a certain number to keep up the stock.

25,366. Are there any breeders of store cattle in Cheshire?—Yes.

Depression in Cheshire.

25,367. (*Mr. Everett.*) Your county is the only one, as we have heard from some witnesses, in which there has been no general reduction of rents. Have you any knowledge of other parts to be able to give us an idea how it is that Cheshire stands on so different a footing from the other counties?—I cannot, except this: I think that being a dairy county perhaps they have staved off the depression longer than some other counties.

Mr. J. Edwards.

22 June 1894.

25,368. There must be something peculiar to the herbage in that county which gives a quality to its produce?—Yes.

Landlords.

25,369. (*Lord Rendel.*) You have a very good landlord?—I am satisfied with him, I believe that he is a good landlord.

25,370. And you live in the neighbourhood where the landlords are good all round?—As a rule I think we are very fortunate; they are all good landlords in the neighbourhood.

25,371. Then you have no fear but that justice will be done?—I have no fear but that justice would be done in any case.

25,372. Whatever the terms of your agreement were you do not think they would be enforced if unfair?—They would not. I think those clauses are right enough to be in an agreement, because a landlord is bound, no doubt now and then, to meet with a black sheep that would try to pull the farm all to pieces and leave it in a worse state than he found it.

25,373. And sometimes a farmer will find a bad landlord?—Not often. But there are landlords who occasionally meet with a bad tenant.

25,374. But in your neighbourhood that is not an experience that you have met with?—I can only say that in my immediate neighbourhood of Cheshire; I only speak for within we will say 10 miles of the town of Crewe or Nantwich, on the large estates I have mentioned, I have never seen, that I am aware, any injustice done.

Effect of the depression.

25,375. Then the disappearance of farming profits in Cheshire, or in your part of Cheshire, has happened only within the last two or three years?—Three years I think I mentioned.

25,376. Not of longer standing?—Not seriously. It was bad before, but not so serious as during the last three years.

25,377. And you come here to speak of the farming of Cheshire as you find it under those conditions?—I have come here to give what I thought was my really candid opinion, and I have done so as nearly as I possibly could.

The witness withdrew.

Prof. J. Long.

Professor James Long called and examined.

Prof. J. Long.

25,378. (*Chairman.*) You were formerly Professor of Dairy Farming at the Royal Agricultural College?—Yes.

25,379. You are also Chairman of the Education Committee of the British Dairy Farmers' Association?—Yes.

25,380. You are also Chairman of the South Hants Farmers' Union?—Of the Committee.

25,381. And you are a delegate to the Chamber of Agriculture?—I am.

25,382. And you have also been a judge at the Royal and many other agricultural shows at home and abroad?—Very frequently.

25,383. And you are the author of several works on agriculture?—I am.

25,384. And you are a farmer?—I occupy two farms in Hants and Herts.

Particulars of farms.

25,385. And they are from 600 acres to 700 acres each, or are they that together?—They are that together.

25,386. How long have you held those farms?—One for six years, and the other one is recently taken.

25,387. Then you have taken them since the depression?—I have.

25,388. May I ask what rents you pay for them?—The first farm is about 23*s.* per acre, and the second farm about 25*s.* or 26*s.*

25,389. Are they fair rents, not very low?—The second farm is a fair rent, the first farm is not.

25,390. You mean that the rent is high?—It is too high.

25,391. However, you contracted to give that rent?—I did.

25,392. Six or seven years ago?—I did.

25,393. Was that on lease?—On yearly agreement.

25,394. What is the size of the two farms?—The first farm is 458 acres with woods, and the second farm is 233 acres.

25,395. (*Mr. Chaplin.*) And the first farm was let at 23*s.*?—That is a calculation by deducting the woods.

25,396. And the second at how much?—About 25*s.* an acre, and the acreage 233 acres.

25,397. (*Chairman.*) Have you had any reduction of rents since you came into the possession of this farm?—No, I have had remissions.

25,398. What has been your experience of farming on that farm?—Very bad indeed.

25,399. (*Mr. Chaplin.*) On both?—Not the second farm, it is only a recent take.

Farming in Hampshire.

25,400. (*Chairman.*) It has not deterred you from taking another farm?—The present year has exceedingly good prospects in Hampshire and Hertfordshire.

25,401. The present prospects of both farms?—Yes.

25,402. And in the last two years in Hampshire it has been extremely bad, mainly on account of the seasons?—On account of the drought and the inferiority of the labour.

25,403. But apart from that, which was a continuing matter, were the last two seasons bad in Hampshire?—Very bad, indeed; I never knew worse.

25,404. Was one a very cold season and the other droughty?—The last two were very dry; the third back was wet, and the last too dry.

25,405. What part of Hampshire is that?—Near Romsey.

Prof. J. Long.

22 June 1894.

Quality of labour.

25,406. Are they dairy farms?—No, sheep. The second is a dairy farm; the Hertfordshire farm.

25,407. You have suffered there from the inferiority of the labour?—Very much indeed.

25,408. Why is that? Is that because the labourers are inefficient?—Inefficient in every possible way; many are lazy and ignorant.

25,409. Is that compared with other districts?—I think they are the worst in England.

25,410. (*Mr. Little.*) Is this with reference to Hampshire or Hertfordshire?—Hampshire.

25,411. (*Chairman.*) Are they mostly old men?—Very few old men; the old men are by far the better, and if you import a new man to the district he at once shows you the superiority of his own work as compared with that of the local men.

Wages.

25,412. How do the wages run there?—11*s.* to 12*s.* a week for day labourers without cottages, and the stockmen 14*s.* to 15*s.*, and they get 3*l.* a year at harvest, and perquisites in the hay time.

25,413. And the wages have remained about the same of late years?—I think there has been very little difference since I have known the district.

25,414. Had you previously farmed in another part of the country?—In Hertfordshire.

25,415. What has been your experience there?—I will not say bad at all, because the land is better and the labour is better.

Suggestions for improving the condition of tenants.

25,416. Now what are your suggestions with regard to the improvement in the condition of tenants in farming?—The first is, that I think that the farmer should be encouraged to farm better by receiving greater security for the improvements he makes, and by fixity of tenure, and by freedom to make certain improvements without consent, with a freedom in cropping and in the sale of produce, by compensation for disturbance, and by the abolition of distraint for rent.

25,417. Those appear to be rather alternative methods; they are not suggestions which would all be adopted at once?—Probably not.

25,418. Fixity of tenure seems to imply all the others?—That is what some people say; I do not think that it does.

25,419. Perhaps you will explain what you mean by fixity of tenure?—With regard to fixity of tenure, I should adopt the lines chiefly, or rather, generally speaking, the lines that Mr. Smith includes in his Bill, although many of us held the same views long before Mr. Smith's Bill was heard of.

25,420. That, in point of fact, would be the adoption almost of the Irish system?—Very nearly so.

25,421. That is to say, you would recommend judicial rents and free sale?—Yes.

25,422. And fixity of tenure?—I would.

25,423. That is to say, when once a tenant has come into possession, that he should be entitled, notwithstanding any agreement he may have come to, to appeal to a tribunal as to the rent?—Yes.

25,424. And that he should, as long as he confines himself within the conditions, be entitled from time to time, to a renewal of his lease?—Under certain conditions; fair conditions to the landlord.

25,425. And that he should have the right of assigning his interest without the consent of the landlord?—That is a point I will not express an opinion upon. I have not gone so far as to declare, in my opinion, whether I would do so, as to the assignment.

25,426. It might differ from the Irish system?—Yes.

25,427. But you have not come to any conclusion on that point?—I have not.

25,428. Have you considered whether it would be possible to give the other two without also going to the extent of giving the right of free sale? I ask that question because when the Irish Land Bill was under discussion it was always argued that the three went together—that you could not give one without giving the other too?—Certainly, I would give free sale. It is simply a question of assigning the right on the death of the tenant. That is the point I have not made up my mind upon.

25,429. But presuming that those two were given, the judicial rent and the fixity of tenure, would it be further necessary to carry out the other suggestions you make, namely, security of improvements and compensation for disturbance?—Yes, I think it would.

Prof. J. Long.

22 June 1894.

25,430. Because there would be no disturbance if there was fixity of tenure, and if there is fixity of tenure there would be no change of tenure without the consent of the tenant?—Number 4 is clearly an alternative proposal for disturbance.

25,431. That is what I understand—they are alternative propositions?—Yes.

Reduction of rent.

25,432. In your own case have you asked for a reduction of rent since you have been a tenant?—Yes.

25,433. Have you been refused?—I have been refused.

25,434. On what ground?—No ground assigned at all.

25,435. I suppose mainly on the ground that you are a substantial tenant?—I had a remission instead.

25,436. In your district do you consider that the land is over-rented?—Some of the land is let at a fair rent, at least the majority of the land, but the remainder is distinctly over-rented.

25,437. And held under a yearly tenancy?—Generally so.

Average rent.

25,438. Can you give what you consider a fair average rent in that district?—About 10*s.* an acre.

25,439. What should you say the actual rent averages generally?—I should say the rent averages 12*s.* probably.

25,440. Has there been any discussion among the tenants in that district with reference to these proposals?—Very frequently.

South Hants Farmers' Union.

25,441. Is there an Agricultural Association there?—The Association of which I have spoken, the South Hants Farmers Union.

25,442. Have they come to any resolution on the subject?—Yes, we have.

25,443. In favour of fixity of tenure, or in favour of what?—The resolutions we have arrived at have been sent to the Chamber of Agriculture, and although they are not quite so bold as my own they are upon the same lines.

25,444. How far do they go? When you say they are not quite so bold one would like to know exactly what they are?—I mean they do not commit the Union to the actual principle, or rather to the actual wording that I give you, but to the principle.

Agricultural Holdings Act.

25,445. Would you give us the exact nature of their proposal?—"Record of farm on a change of tenancy "to be made by the official valuer"; "concurrent "notice of claims made by both landlord and tenant "not less than one month before expiration of tenancy," "appoint county valuers at fixed moderate rates of "remuneration."

25,446. "Fixed moderate rates of remuneration"; does that mean on the change of a tenancy?—That means the charges made by the valuers would be fixed and moderate.

25,447. That has not reference to rent?—No. Their other recommendations are "improvements under first "schedule to be limited to buildings, making of water "meadows and irrigation, application of water power, "warping land; compensation for home-grown corn "consumed on the holding;" "repeal Act and pass "new one. Freedom of cultivation and sale of all crops. "Uniform system of valuation for hay and straw."

25,448. Those recommendations do not contain anything on the subject of tenure; they do not go the length as I understand them of recommending judicial rents or fixity of tenure?—They do not.

25,449. When you said just now that they were not so bold as your proposals, you meant that they did not go your length in asking for those two proposals?—No.

25,450. They confined themselves to what are practical recommendations for amending the Agricultural Holdings Act?—Yes, that is so.

25,451. (*Mr. Chaplin.*) I understood you to say that the resolutions of this association did adopt the principle of your proposals; as a matter of fact, from what you tell us now, they do not adopt it. I want to make that quite clear?—I do not think I said the resolutions that they had resolved, but that the members adopted the principle. Perhaps I may explain that what has

Prof. J. Long. 22 June 1894.

been done has been partly my own resolution. My resolution was drawn with the object of passing a resolution, and I therefore drew it distinctly in an essentially moderate tone, so that the whole chamber might be united.

25,452. (*Chairman.*) Then there was a difference of opinion, and you thought it best to combine the whole in one recommendation in favour, as you say, of the more fair proposals?—The more moderate.

25,453. There was discussion upon the subject, and there was some difference of opinion, and you desired to have a general concurrence in their recommendations, and therefore you limited your proposals to the more moderate ones?—Exactly so.

25,454. Of course it is all-important that we should know whether your views upon these stronger measures represent the views of the association?—Exactly so.

25,455. But apparently they do not, although there is some opinion in their favour in the association?—Quite so.

Improvements under Schedules II. and III.

25,456. Now, short of these bolder suggestions, or these wider suggestions, what do you think should be done?—With regard to improvements, I suggest that the tenant should be free to improve in accordance with Parts II. and III. of the existing Act, and that in addition he should be permitted to lay down land to grass, to plant osiers, to make gardens, to make orchards, to plant fruit bushes, to make, remove, or repair fences; to plant hops, and to improve roads, ponds, or watercourses; and, further, that he should be allowed to obtain remuneration for the consumption of home grown corn upon the holding, for seeds two years or over if they are worth leaving down, for increased fertility due to good farming and any other improvement which is really an improvement not included in the above.

25,457. Some of those apparently have relation to agricultural produce, to the growing of crops and so forth, such as the laying down to permanent grass, and the planting of hops; the others, I think, have relation to more permanent improvements such as buildings?—Yes.

25,458. Do you think that tenants should be allowed under the Act to erect buildings of a permanent character in the same manner as they can effect improvements now under the second and third schedule, without the consent of the landlord?—No.

25,459. You do not think so?—I do not think so.

25,460. I thought that was one of your recommendations?—I do not include the erection of buildings.

25,461. (*Mr. Little.*) All the other improvements that are now in Part I. would be removed to Part II. I understood; was that so?—No; I suggest that the tenant should be allowed to improve as per Parts II. and III. of the schedule of the existing Act.

25,462. (*Mr. Channing.*) With the exception of buildings only, or with what exceptions?—I have not got the exact items with me, I had just taken down what I thought was a proper thing to recommend.

25,463. Still, at all events buildings, of course, are most important?—Part I. includes the erection and enlarging of buildings and formation of silos. Those are two points I do not include in my recommendations.

25,464. (*Chairman.*) You think the compensation should only be given for those in the event of their having been erected or improved with the consent of the landlord?—I recommend that the tenant requiring any improvement such as Part I., exclusive of those points that I have mentioned, should give notice to his landlord, and if the landlord is unwilling to make the improvements or to carry out the improvements, the matter should be referred to an umpire to be selected from a number appointed by the Board of Agriculture, and agreed upon by the two parties.

25,465. (*Mr. Channing.*) That is, consent or reference is the principle you would apply to those?—Or reference to an umpire.

25,466. (*Chairman.*) It is somewhat different from the proposal of the Act dealing with drainage?—Yes, it is.

25,467. The tenant should only be entitled to compensation if the landlord has refused to effect them himself, and then the arbitrator has to determine that they are reasonable?—Exactly so.

25,468. Of course under Part II. the drainage can be effected by the tenant, and compensation can be claimed by him if the landlord has refused to do it himself?—Exactly so; that is quite satisfactory.

Prof. J. Long. 22 June 1894.

25,469. But I think you do not go quite so far as that?—I would leave that quite as it is. I think the conditions of a farm should be recorded for the guidance of the valuers.

25,470. On every change of tenancy?—Yes.

25,471. Then you further suggest that there should be compensation for disturbance in a fixed going concern; is that recommendation based on the earlier of the Irish Land Acts?—No. May I come to that in a minute or two?

Landlord's claims.

25,472. Yes; I only wish to take your evidence in the order you desire?—The landlord's claim should be confined to two years. I do not think that notice of claim is necessary. That is a point that has been much debated. I think that valuers should be required to carry out the Act upon the expiration of a tenancy. I should be quite satisfied if on leaving a farm the valuers—my own and my landlord's—met together and determined the sum to be paid or received, simply being guided by the Act of Parliament. I do not think that notice is at all essential, because there is nothing to be gained by it.

25,473. (*Mr. Chaplin.*) On either side?—On either side.

Compensation for disturbance.

25,474. (*Chairman.*) Then with reference to your proposal for compensation for disturbance?—I should like to give you a case in point. An owner of a property, the previous owner having died, wishes to turn out his tenant, and go and live on the farm and farm the place himself; the tenant during the course of a number of years has formed a business connexion; he has a large milk connexion, or for the sale of straw, hay, stock of various kinds, potatoes, and dairy goods; he has built up this business, and he is compelled to relinquish it in favour of another person, and without the payment of a single penny. Moreover, the loss entailed in leaving one farm for another is very considerable, and a man may have to begin life again.

25,475. Then you would meet those cases by providing that there should be some compensation for disturbance?—Yes, by reference.

25,476. What would be the measure of that?—I would simply refer the case to the umpire, and accept what he decided to award.

25,477. You would not lay down any rule such as in proportion to the rent?—I do not think you could. I think the evidence should be given as to the actual state of the case, the value of the business.

25,478. (*Mr. Channing.*) You would not attempt any scale based so many years rent as in the Irish Land Act, would you?—I would not. I think you must be guided by a man's business.

25,479. (*Chairman.*) Then if instead of building up a business such as you speak of, the farmer has sold his produce in the open market from week to week or from month to month, would he then be entitled to compensation for disturbance?—As a matter of fact he cannot sell his produce in the open market. He may sell his corn and he may sell a portion of his stock, but he cannot sell it all in the open market, because there is no open market for a large amount of produce. You cannot sell your hay, your potatoes, your dairy produce, except milk, nor can you sell vegetables or fruit in the open market.

25,480. I should have thought in the case of dairy produce that what you say is correct, that is that it is generally sold to some customer, but I should have thought that fruit and hay and so forth would be sold in the open market?—I know by bitter experience that it is not so—dearly bought experience.

25,481. In cases where the farmer has not built up this connexion but has sold in the open market, would you suggest that there he should be entitled to compensation for disturbance?—Certainly, because he cannot leave his farm without loss of some kind, it may be small but there must be a loss.

25,482. But still it would be reduced in such a case?—Unquestionably.

25,483. It would be only the loss caused by the change from one farm to another?—There is the risk as well.

25,484. The arbitrator would not give him any compensation of the nature you speak of, namely, for

Prof. J. Long. 22 June 1894.

building up a business?—Not in that case, but having a farm in hand, having understood the land he farms, he is in a position to do well with it if it is worth his keeping. Going to a new farm he has to begin again and learn the value of the land he is going to farm. I believe, if the tenants were engaged in the way I suggest, or even in a modified form, that a great deal of poor land would be brought into cultivation. Men will not take poor land because they know they are bound to farm it well in order to make it pay and to put capital into it, which they are prevented from doing by the existence of the present law. I should like to add that I think the landlord should be entitled to compensation for neglect on the part of a tenant and for bad farming, allowance being made for seasons, and, further, that the interpretation of the words "bad farming" should be in accordance with science as well as common sense.

Landlord's claims.

25,485. Then the liability of the tenant to the landlord might be considerably increased beyond what it is now?—Exactly.

25,486. That would be a kind of counterclaim on his claim?—Certainly. Whatever is fair on the part of the landlord should be allowed for by the umpire.

25,487. And to a large extent depending upon the valuation of the farm and of the full specific account being given of the farm at the commencement of the tenancy?—Quite so.

25,488. Would it be possible, in your opinion, to apply this to farms now in possession and which have been for some time in possession of the tenants, because there would be no record of the condition of the farms on the first entry by the tenant?—I think in the first case that arose it would be essential to obtain evidence from persons who knew the farm upon the entrance of the tenant.

The Ground Game Act.

25,489. Then I see among your heads of suggestions this: "Penalty for violation of the law as in existing Act"; what do you mean by that?—I was asked some time ago, to address a farmers' club consisting of some 200 members upon the Agricultural Holdings Act and the Hares and Rabbits Act. I was told that every man had to contract out of the Act although the Act had been passed some three or four years, and that further they were not allowed to kill the hares and rabbits upon the estate. I told them that I would not attend unless I was assured there would be no desire to cause friction between them and their landlord. I heard upon this point and I went down, met them and the agent of the estate, and I found that upon the back of every rent receipt was a contract contracting them out of the Act of Parliament, and that they were also forbidden to shoot hares and rabbits. The concession was made at a meeting which took place, and the thing was at an end. What I mean is this: that if anyone wilfully violates the Act as in that manner he ought to be made to pay for it.

25,490. Have you known many cases yourself in which the spirit of the Act is not observed?—Very many indeed. It is quite common with regard to hares and rabbits.

25,491. Where the landlord threatens eviction if the hares and rabbits are killed by the tenant?—I will not go so far as to say that because it would be difficult to prove it. I can only give you the statements made by the tenants themselves that they dare not do it; and that is particularly the case in one part of Lancashire covered by the Federation.

25,492. Have you found it so in Hampshire where your farm is?—In parts of Hampshire; in fact, in many parts of the country. I have been engaged in this work in many parts of the country, and I have often found it to be the case.

25,493. Have you experienced any difficulty yourself? Never. I have had the shooting. I would not take a farm without it.

25,494. Then your proposal is that in order to ensure the observance of the Act a special right should be given of compensation in the event of the landlord not carrying it out. Would you mind explaining that?—I mean that there should be a penalty attached.

25,495. Not in the nature of damages?—No, not at all; simply a penalty to pay a fine to the Crown.

25,496. Might it not be just as difficult for the tenant to enforce such a penalty as to enforce the law against the landlord? I do not see for the moment that you carry the thing much further. It would still rest with the tenant to enforce the penalty, and he might be quite as unwilling to do that as to endeavour to carry out the law, that is to say, of killing the rabbits and hares himself?—That is so, certainly. I quite see that.

Prof. J. Long. 22 June 1894.

25,497. I do not know whether you follow me; at present the tenant has power if he thinks fit of killing the hares and rabbits, as I understand you, and he is unwilling to do so on account of his fear of what might happen to him from his landlord. Now you suggest a further protection to the tenant, namely, that there should be a penalty on the landlord who does not carry out, in spirit, the Act; that penalty would be enforced by the tenant?—Exactly.

25,498. Would there not be just as much unwillingness on the part of the tenant to enforce that penalty against his landlord as to refrain from exercising the right which the statute has conferred upon him?—Quite so. I quite understand that in the case of hares and rabbits, where nothing exists except the knowledge gained from words that you could not make a case; but in the case I have quoted it would be quite possible to make a case.

25,499. I am not so much putting the question of the difficulty of making a case, but the unwillingness of a tenant to take action for the penalty against a landlord, fearing what the result might be to him?—I do not suggest that it should be the tenant who should take the steps. I merely suggest that it should be a penal offence to contract out of the Act, if the Act prohibits it.

25,500. If there is a penalty it must be enforced by somebody, and the evidence procurable for the purpose of enforcing a penalty could not very well come from anybody but the tenant. It must be the tenant who would make the complaint in evidence or otherwise that he has not been allowed practically to carry out the Act in its spirit. Would not the tenant under those circumstances be quite as unwilling to give evidence in support of the penalty of this kind as he is unwilling, according to your account, to avail himself of the privilege conferred by the Act?—I quite believe he would. That is all the more reason why the penalty should exist.

25,501. (*Viscount Cobham.*) Was this contracting out in writing?—It was in print.

25,502. (*Chairman.*) I suppose the contracting out is rare; the commoner case is that nothing passes between the landlord and tenant in writing, but the tenant is unwilling to exercise his undoubted right under the statute of killing hares and rabbits fearing what the landlord might do?—He is most unwilling.

25,503. That is the common case?—Yes, quite so.

25,504. I do not quite see how your proposal for putting a further penalty against the landlord would meet that case?—It would not be very difficult to devise. I would not suggest a legal method of which I know nothing. I merely suggest it as a matter for the protection of the tenant.

25,505. At all events, you could endeavour to enforce the spirit of the Act by further provisions if possible?—I would.

25,506. You stated just now that the condition of the labourers was a serious one?—It is.

Technical instruction of labourers.

25,507. Have you any suggestions to make on that point?—I have made a suggestion to the Director of Education of the Hampshire County Council that the labourer should receive a course of instruction in thatching, in hedging, in hedge carpentry, and in draining and ditching, and various other processes. I called a meeting of our union and proposed this to the farmers. It was desired by the gentleman in question that the matter should come through our body, and I can only tell you that to a man every farmer refused to be a party to the expenditure of a single penny in educating the labourer. I think the matter should be undertaken in all parts of Hampshire and in most parts of the country.

25,508 (*Viscount Cobham.*) What was their resolution although it was not their own money which was proposed to be spent; they objected to any part of the grant to the county council being expended in that way?—Quite so. They thought the men knew quite sufficient and did not want it; they knew too much, in fact. But as a fact to-day it is impossible almost to obtain a thatcher or an expert man of any kind.

Prof. J. Long. 22 June 1894.

25,509. (*Chairman.*) When do you think this instruction should be given to them—at what time of their lives?—When they are from 18 to 21 or 22.

25,510. Some years after they have left school?—Yes; this particular kind of education.

25,511. How could it be done; would it involve their being withdrawn from their farm work for a time?—It would to a slight extent. I should like to give you a case. We make hurdles for sheepfolds very largely in Hampshire; almost every farmer has his own copse to obtain the wood from. I proposed in this case that a man should be employed—I had a man myself who was willing to do the work—to teach five or six young fellows at a time how to make those hurdles and the sheep cages that they use for putting in the hay; that they should be allowed to have practical classes in the field or in the wood during the hurdle-making season for a large portion of an afternoon once or twice a week. The cost would be extremely slight, and the value to the young fellows would be immense.

25,512. Have you any further suggestion to make with regard to the labourers?—No.

Law of distraint.

25,513. Are you in favour of abolishing the law of distraint for rent?—I am in favour of it distinctly, and I would like to give you one reason. The tenant who agrees to pay a certain rental for a farm is compelled to do so under pain of having his goods taken from him; but if the landlord contracts to do certain work, such as repairs upon a farm, and he does not perform his promise, the tenant has no claim at all unless he goes to common law. That is as I understand the case. Therefore I think it is not fair to compel one man to keep to his agreement by a summary proceeding unless you compel the other one to do the same thing.

25,514. It has been alleged that the system is rather favourable to the small farmer because the landlord is thereby not able to press him so closely for rent?—That is so, but I think that cuts both ways. The landlord is enabled to get farmers who have no capital at all to occupy his land and to pay higher rents, which he would not be able to do if this law of distraint were abolished.

25,515. That, of course, may be a question for consideration with tenants who may come in in future, but in the case of existing small tenants might it not be rather hard upon them to abolish the provision, and might it not result in the landlords immediately pressing the smaller tenants for the full payment of rent, in order to anticipate other creditors?—I think landlords would probably do so, but I think it would be because they had accepted these men without their having sufficient capital.

25,516. Might it not be rather hard upon the small tenants to make such a change in a time of depression?—I do not see why it should.

25,517. The effect might be that the landlords would insist more closely upon the payment of rent?—They would unquestionably do so.

25,518. That occurring at a time of depression might be rather detrimental to the interests of these smaller tenants?—I think it is quite possible that they would not be too hard, because it is not so easy to let the farms in these days to men who have capital.

25,519. It is a question of getting money in preference to some other creditors—that is really the point?—Yes.

25,520. The landlord now feels that he always has a preference over other creditors in respect of a year's rent and therefore he is inclined not to press the tenant?—Yes.

25,521. If an alteration was made in the law with regard to existing tenants there might be an inducement, it has been alleged, to the landlords, at once to put in full force their powers of obtaining their rent, and that might deprive the smaller tenants of this kind of privilege?—I have seen no answer to the statement that the landlord as a preferential creditor is simply taking, in the form of rent, the interest on his capital, whereas another creditor may lose through that action on the part of the landlord not only his interest but his principal. I have known cases of that kind where the landlord had seized for rent and has actually taken the implements and the machines which have been sold to a tenant by a neighbouring agricultural machine maker or seller, who has lost the whole.

Prof. J. Long. 22 June 1894.

Light railways.

25,522. Now go on to the next point—the promotion of rural railways—what do you mean by that? Do you mean something in the nature of light railways or tramways?—I should like to call your attention to the Belgium system as carried out by the "Société Nationale des Chemins de Fer Vicinaux" which has 67 railways of from 2 to 35 miles each in length. These railways are in the neighbourhood of most of the principal towns in Belgium. The capital was furnished by the State to the extent of 27 per cent., by the provinces of 28 per cent., by the Communes of 41 per cent., the balance being provided by private individuals. These railways have a tariff which compares with very great advantage with the tariff of our own countries. The charge is as low as 5*d.* a ton for a fixed rate with a variable rate of 7 to 13 centimes per ton per kilometre for ordinary traffic. They also have a special rate under which four tons are carried for 1*s* 2½*d.* for all distances or per kilometre for 1½*d.* There is also a fixed charge of 5*d.* a ton or four centimes per kilometre; under this heading agricultural produce is included. Stock, hay, straw, manure, food, coal, and fodder of all kinds are being carried at this exceptionally low rate.

25,523. Are these railways that you speak of independent of the main lines?—Yes, but in connexion with them, they are light rural railways.

25,524. Do they go alongside of the main roads?—Generally.

25,525. Do they carry passengers as well?—They do, and the farmers are allowed to take in their small produce to the towns for sale without charge. Milk is taken for distribution free of charge, and the empties are returned free.

25,526. Do you know what the financial result has been?—I believe interest has been paid to the extent of 4½ per cent., in fact it is provided for by the law. So far they have been quite a success.

25,527. When you say it is provided for by the law, do you mean to say that that is guaranteed by the State?—I should have liked to have quoted to you the exact words. What I mean to convey—I did not convey it before—is that they cannot pay more than 4½ per cent.

25,528. (*Viscount Cobham.*) What interest do they earn?—I cannot say.

25,529. (*Chairman.*) Is the 4½ per cent. paid by the State?—It is not a State affair. This Company is under the ægis of the State, shall I say: the king appoints the president, and I think one-half of the directors are appointed by the State, and the other half by the shareholders.

25,530. (*Mr. Whitehead.*) Do you know what the cost of construction is per mile?—I do not, I hope to obtain that figure shortly.

25,531. (*Viscount Cobham.*) Do they have to pay for the land?—That I do not know. I believe they are nearly all on the side of the highway, where there is no cost at all.

25,532. On the highway itself?—On the side of the highway. I have seen some of the railways abroad, and that is the reason why I brought it before the Commission. The same thing occurs in Italy. I rode from Lodi on a rural railway right into the country to see some of the Italian farms. It was built on the side of the road. It was built, I believe, by an English Company and it is in charge of English people. The people there can take their produce backwards and forwards at a very small cost indeed. It has been suggested that we could not carry the system over the higher lands in Yorkshire, for example. I should like to suggest that the Alpine system could be adapted to any railway system so that the rural railway could climb over the highest mountains we have, as it does in Switzerland.

25,533. (*Chairman.*) Are the carriages on this line of the same kind as the ordinary railway carriages, or have they to tranship the produce?—That I cannot answer. Those I have ridden upon have been narrow gauged. The carriages are quite as wide as usual, but the wheels run up upon narrow gauge rails.

25,534. Are they adapted to go from one gauge to the other?—I think they would be on the American system in which the carriage is put on to another pair of wheels.

25,535. As I understand, you would extend that system into England?—Yes. I have seen the same thing in America, and have ridden on rails in the

Prof. J. Long.

22 June 1894.

Western States, and in the Eastern States as far as 10 miles from a town.

25,536. Do you know why the Acts relating to light railways in England, or rather the provisions for encouraging light railways here, have failed?—I do not know. In connexion with this question I should like to give this illustration from my own case. Last year a man with one horse and cart was employed on 120 different days in journeying backwards and forwards from the farm, which was in Hampshire, to the railway station, and on 15 days (I am taking a particular case) a man was employed going from Romsey to Southampton also twice daily to the station with milk. This was done at an enormous cost, a very large portion of which might have been saved by the adoption of the rural railway system.

25,537. How far are you from a railway station?—About two miles on the high road.

Supervision of markets.

25,538. Now what have you to say about the supervision of the produce markets?—That is a matter which it seems to me should be taken in hand with vigour by the authorities. I have sent every kind of produce to our markets in London, hay, roots, potatoes, stock live and dead, and I do not remember a single instance in which there has not been some deduction, or some fraud on the part of the salesman. I suggest that every consignment should go through a market official, that the consignment should be entered in official books and weighed, and that the price realised should be recorded together with the name of the purchaser. I also think that there should be a central auction sale, as in Paris, for the sale of butter and cheese and small produce. If you send your produce to London, it does not matter how careful you may be in weighing, there is always a deduction made for short weight. If you take the market prices of the day, or even the market price as quoted by the salesman himself two days previously, you invariably find that the price he gives you, whatever class the produce may be, is lower than what he has quoted or what the papers quoted. I think there should be some means of defending the producer as against the London salesman.

25,539. Would you advise that there should be more markets in London?—I think there should be a central produce market to answer to the Paris Halles where butter, and cheese in particular are sold by auction. I could mention a single case which occurred recently. Lambs were sold in Hampshire from my own farm at a price of 40*s.* a piece; being overstocked I sent a draft of the same to London by railway, and in spite of the published prices in the papers they realised 25*s.* a piece, or about 6½*d.* a lb. as against 11*d.* a lb. in the neighbourhood.

25,540. Do you think that they were sold improperly, or that the agent did not remit you the money?—I am quite confident they were sold by the agent at a price which he did not quote to me, and that he paid me what he chose. I know from dealers who make it a business to go from Hampshire to London with sheep that it is a matter of personal communication, and of doing the best you can with the salesmen. In the Smithfield Market there is a market book in which every salesman of hay is compelled to enter the hay he receives from a country consignor, the price he realises for the hay, and the person to whom it is sold. You may consign hay to one of these men. He may take it from the station and deliver it direct to one of his own customers without going to the market at all, and thereby he evades the market book, and this being the case, he defies you and you have no remedy. This has occurred very frequently, and it has occurred to myself, so that I am able to speak with confidence upon it.

Adulteration.

25,541. Then what have you to say upon the prevention of unfair competition?—The sale of meat was dealt with last year by the Select Committee. With regard to milk it is frequently sold in London in the winter season at 3*d.* a gallon, when it is actually costing the wholesale man as much money. This is owing to the fact that the milk is mixed with separated milk. It unfortunately happens that there are no means—I think I may say no means, actually, when it is skilfully mixed—of detecting fraud, because if the dairyman is a skilful individual he can maintain the solids and the fat of the milk at something above the normal standard. Therefore he is able to sell this produce at a lower price than he could otherwise do, and the farmer is defrauded in consequence. I think that should be taken in hand by the authorities, and that the question of the admixture of margarine with butter should also be taken in hand. With regard to milk itself, my suggestion is that there should be a standard defining pure new whole milk as milk containing 12·25 of solids and 3·25 of fat. These standards, I am quite aware, would be objected to by many persons in the trade, but the standards are much higher in New York and in Boston, where the laws are very stringent, and they are produced by farmers in a general way with the greatest possible ease.

Prof. J. Long.

22 June 1894.

Sale by live weight.

25,542. Then with regard to the sale of cattle by weight, what have you to bring before the Commission?—I wish to make this suggestion: that although weigh-bridges are in many cases now set up in the markets it is not compulsory upon the auctioneer to have the cattle weighed before they are offered in the ring. In the great market at Perth the cattle have to pass over a weigh-bridge of the kind over which there is a dial which indicates the exact weight of the beast or group of beasts, and although this is not always used, because it is not binding, my suggestion is that it should be compulsory upon auctioneers to indicate the actual weight of every beast they sell, for the simple reason that the butchers and the dealers who form rings invariably get the best of the farmer, who has less experience in weight, and who cannot compete with them when they combine. I give you this as my own experience, because I have had frequently to fight these rings myself, and have generally been beaten.

Cattle diseases.

25,543. Then with regard to cattle diseases what have you to say?—I think tuberculosis should be scheduled as a disease to be paid for, every diseased animal being destroyed, and paid for at its market value, and every animal in contact being also destroyed (unless the veterinary surgeons have any reason to believe there is no fear of disease breaking out), and also paid for at the market value. I further suggest that abortion should be taken very seriously in hand by the Government. It is now known to be a contagious disease—I think I am right in saying so—and one which inflicts enormous danger upon an owner of stock. I have twice had this disease in my own herd, and I am perfectly satisfied that it has arisen entirely from contact with diseased beasts; and that you cannot stop it under from a year to 18 months, even when taking the greatest possible trouble. I think the Board of Agriculture should define some system of checking the disease, and that farmers should be enabled to apply to the Board for the services of a skilled man to come down and advise them how to carry out the work of checking abortion. I am quite satisfied that unless farmers are paid the value or something approaching the value of the stock they have which is diseased, nothing in the world would check it. This applies particularly to swine fever.

Market gambling.

25,544. Then with regard to legislation for preventing speculation in agricultural produce, what have you to say?—This is not a question I am very well acquainted with. I simply wanted to tell the Commission that last year I went to the New York Produce Exchange and was initiated into this subject which I wished to understand, and that I was thoroughly convinced that the system of speculation exists, and that wheat is sold as well in England as in New York, which the seller has no control of whatever. It appears to me to be put in this manner, and I give you the case as it was put to me by one of these speculators himself. The seller is a speculator buying and selling on the chance of gaining more money by his gains than he loses by his losses. He is always willing to sell wheat at a price although he has no control of it, and he trusts entirely to the future to obtain sufficient wheat to cover his sales, but in some cases he cannot do so, and is compelled to buy from the very persons to whom he has sold. This is a thing that I do not think can possibly be denied, because they admit it themselves on the New York Produce Exchange. I think it ought to be made penal for a man to sell what he does not possess; the markets are inflated by those operations.

25,545. Do you consider that it tends to lower the price of wheat?—Certainly, because the sales represent a much larger amount of wheat than is actually in existence.

25,546. On the other hand, there is always a purchaser, and one would think that the fact of there being purchasers would tend to raise the price, therefore whatever tendency there is to lower the price on the one side is met by a tendency to raise the price on the

Prof. J. Long. 22 June 1894.

other. I find it somewhat difficult myself to understand how speculations of this kind can really affect in the long run the price one way or the other?—Might I put the case in this form. Supposing a small town supplied with butter by the farmers of a confined district, and that they are obtaining as they do in Hertfordshire 16*d.* a lb. for their butter; a speculator comes into the market, which is held weekly, and he offers a similar class of butter of which he shows a sample at 1*s.* a lb. He sells a large quantity of this butter for future delivery, so he forces down the price on the part of the farmers who know that unless they accept a price similar to his they cannot sell.

25,547. That seems a very different case from what you were mentioning just now, namely the speculation in produce where the speculation represents a fictitious transaction; you are mentioning now an actual transaction?—I think the two things are quite analogous.

25,548. What I wish to know is how you consider these sales and purchases of a fictitious character representing futures and options really affect in the long run the price of commodities?—My point is this, that the speculator is offering a wheat which he does not possess, and which may be offered by the actual possessor.

25,549. But the purchaser, on the other hand, is buying that which equally does not exist, therefore the two seem to me to balance one another?—But I take it that in the ordinary way if the sellers are more numerous than the purchasers the price must be reduced.

25,550. It may be that the purchasers are more numerous than the sellers—that depends upon the drift of the speculation?—Of course it is a matter of price, and the price is reduced in consequence of the offers.

25,551. It seems to me not dissimilar from the speculation in Consols. There is enormous speculation in Consols going on quite independent of actual transactions, and I never heard it suggested that they materially affected the price of Consols in the long run?—Suppose A has wheat which he offers in the market at 65 cents, and B offers the same wheat, over which he has no control, at 64 cents, and C offers the same wheat at 63 cents, to me it is quite feasible, it is quite convincing, that the fact of these three men offering on the market the same wheat at different prices must necessarily tend to reduce the price.

25,552. On the other hand there are three purchasers equally tending towards raising the price, do the two not balance one another?—I do not think so. I think that the purchaser from A would naturally say "I can "go to B or C because there are three sellers in the "market of the same class of wheat and therefore I "will go to the cheaper man."

25,553. (*Mr. Everett.*) But these option sellers are not prepared to deliver the actual commodity are they?—A would be prepared to deliver it at a price on the spot, B would deliver it a little later at a higher price, and C still later and at a still higher price.

25,554. I thought these gambling transactions did not contemplate the passing of the article at all, that neither the seller nor the buyer expect to receive or deliver the article?—It never passes except on paper.

25,555. How can that affect the actual article itself; it is a bet on the movement of prices?—Simply that three men are offering one class of wheat, one parcel of wheat, which is not known to the buyers; therefore upon the assumption that a larger quantity of wheat is exposed or saleable than is in existence the price must be reduced, because the larger the quantity you have in the market, the lower the price.

25,556. (*Chairman.*) At all events I suppose we may take it you have formed the opinion that this form of speculation does tend to reduce prices and therefore should be abolished?—I would not give you my opinion but for having been to see the thing on the spot in New York.

Brewing.

25,557. Now will you tell us what you have to say in regard to the manufacture of beer from barley?—In 1891 the imported barley amounted in value to 5,941,000*l.* and in quantity to 35 million bushels of 56 lbs. each. The quantity grown in Great Britain and Ireland was 79½ million bushels. In 1891 also, I should like to quote this fact, one London brewer consumed in the manufacture of beer 736,000 bushels of malt and 16,500 cwt. of sugar; in the following year the same brewer reduced his malt consumption to 452,000 bushels and increased his sugar consumption to 76,000 cwt. or more than four times the quantity. In London the quantity of sugar used per 19 bushels of malt is 1 cwt. Upon the basis of this London brewer, instead of 56 million bushels of malt being used, we should only use 7¾ millions per annum. My suggestion is that beer made from sugar or by the aid of sugar, that is to say from cane sugar, or beet sugar, should be called by another name and a tax inflicted upon it. I believe for two reasons this should be the case, first because it interferes unfairly with the barley producer, and next because it interferes with the health of the people.

Prof. J. Long. 22 June 1894.

25,558. Have you any evidence to show that it interferes with the health of the people?—Nothing, except medical evidence, which I have observed for some time.

25,559. I think the brewers now, almost without exception, use some amount of sugar?—Almost without exception.

25,560. I believe there are only one or two firms who do not?—I believe there are only two well-known firms who do not.

25,561. With these exceptions they all use sugar, and is it not the common experience of mankind that a certain amount of sugar is not detrimental to the beer?—I think that is the case; a certain amount of sugar, or something equivalent to it, is beneficial to health; it is excess of it which is unhealthy. Bass' and Allsopps' beer is much better for being made entirely from malt. We have a large brewery in my own town, and it has been publicly stated by a local farmer that as many as 40 tons of sugar arrived by train at one time for this brewery. Perhaps I ought not to say so because they buy my barley. They are perfectly within their right in buying sugar and in using it.

Income tax.

25,562. The next point you have on your notes is local taxation and taxation generally?—I suggest that the farmer should be not merely allowed to have his income-tax charged under Schedule D., but that Schedule B. should be entirely abolished for one particular reason; if the man has an income derived from two sources—from farming and from a profession or business, or from private sources, he is charged under two schedules, and although he may have lost considerably under Schedule B., as a farmer, he is compelled, not only to appeal to the Commissioners, but to pay the tax in order to get it back again after appeal under Schedule D., E., or A., as the case may be. I think that is a very great hardship, and a very improper method of procedure.

25,563. I was under the impression that he had now the option of being assessed under Schedule D. or under Schedule B. without repayment?—Yes, he has so; but my point is this, that if he has an income from two sources, and adding the two together finds that he is under the limit and is not liable to pay income-tax at all, he is still compelled to pay for the income he derives from another source and to claim it back after appealing to the Commissioners twice—first as a farmer, and secondly as a business or professional man, as the case may be.

25,564. Is he not in exactly the same position as any other trader in that respect?—No, I think not.

25,565. My impression is that the farmer does not differ from other traders in that respect; another trader would have to pay under Schedule D. in respect of his profits, and if it turned out that those profits plus any other income that he has are such that he would be entitled to abatement or exemption, he would then have to make a claim especially on that account?—If he has private property he is compelled to pay on that, because it is paid by his tenant, and then he makes a claim and gets the money back again. In this case that I am putting there are two businesses—the one the business of a farmer, and the other business under D. or E.; and I contend that he should be allowed to balance one business against the other, and either pay upon the balance or not pay anything at all. But instead of this he is compelled to pay under the schedule for the business or profession.

25,566–8. That is to say, if he takes advantage of Schedule B., I suppose?—Schedule B. or Schedule D. either. I have a case in point that I could refer to.

25,569. What is the case?—A case in which I am personally interested. The tax was charged under Schedule B. and under Schedule D.; the charge under

Prof. J. Long. 22 June 1894.

Schedule B., that is to say, the farmer's tax, was excessive, because a profit was not made, but this was not allowed to be placed against the charge under Schedule D., the income from other business sources, and this Schedule D. was compelled to be paid, and the claim made to the Commissioners to get the money back again.

25,570. (*Mr. Little.*) Successfully?—It is not settled yet.

25,571. (*Chairman.*) I think under the proposals now before Parliament the number of tenant farmers who have to pay income tax at all will be extremely small with the reductions of rent which have now been carried out, and the increased exemptions and the increassd abatements?—I quite admit that. But I do not think it would be fair to compel even a single man to pay a tax that he was not liable to pay. We know—everyone knows who has gone into the question, that there are plenty of farmers who do pay the tax under Schedule B., because of their ignorance of the entire thing. If you charge a man in accordance with his profits as you do under Schedule D, then he knows what he has to do, and he goes and appeals. He says: "I have not made "the income, and I object to pay on it."

25,572. He has the option now?—He has the option, but he does not understand the question at all.

25,573. It is rather a matter of ignorance that he does not know what his legal position is?—My point is that the assumption to-day that a farmers' income is one half the rent he pays plus his tithe and taxes is altogether wrong, and being wrong it is altogether unfair.

25,574. As I have said he has the option of being assessed under Schedule B.; if there is an unfairness in Schedule B. then he can correct it by requiring assessment under Schedule D., therefore Schedule B. can only operate to his advantage and not to his disadvantage. If his income is more than half his rent then if he likes he can be scheduled under Schedule B.?—I quite admit that, but still it would simplify the matter very much indeed and save many a man paying a tax he is not liable to pay if my suggestion were adopted.

25,575. (*Mr. Little.*) Is there any greater difficulty in appealing under Schedule B. than under Schedule D.?—If you are charged under Schedule B. you can go before the Commissioners and state your case, but farmers do not understand that—in my part of the country at all events.

25,576. Suppose a man was charged under Schedule B. he would have to go before the Commissioners and convince them?—He would certainly.

25,577. He would have to produce books?—Or a statement.

25,578. Is it not inability to produce books that prevents the appeals under Schedule B.?—I do not think so. I think the Commissioners very often take statements.

25,579. The appeal is easier made under Schedule B. than under Schedule D.?—It may be quite as easy, but I don't think that is the point I want to convey to the Commission. My point is this, that the farmer does not understand that he can appeal at all; he is charged on Schedule B., and he pays it, whereas if he is charged under Schedule D. and he is told "you are charged as "a farmer, 150*l.* as your profits," then he knows where he is; but if he is told that he is simply charged upon one half of his rent he does not know where he is at all.

25,580. (*Mr. Channing.*) You have to pay your income tax separately in your own case?—Yes, I do.

25,581. I think that would be your position if you were trading in any other way?—If you do business at two different places—yes; that I can understand; but if you are living in one place, and you have two sources of income, I think they should be charged under one head.

Rates.

25,582. I do not know that we need go into the case of the land tax. We have had a good deal of evidence on that point. So we will go on to the question of rates. Do you think that rates should be divided between real and personal property?—I have only to say that I think rates should be equalised between real and personal property, between rich and poor districts; that is all.

25,583. How do you propose that should be done in the case of personal property, assuming that the administration of local affairs is to be local?—I have no suggestion to make upon the point; it is too complicated.

Prof. J. Long. 22 June 1894.

25,584. Have you considered the great difficulty of taxing personal property when the management of affairs is local?—I have considered that, and I have come to the conclusion that I could not tackle that question myself, and I prefer to leave it alone; I could not make any suggestion. I quite admit the very great difficulty.

25,585. Might not the effect be that you would tax farmers' capital as well as the landlords' capital?—I quite admit that.

25,586. In purely rural districts, would not the effect be that you would introduce the farmers' capital, and subject it to taxation as well as the land, and therefore, that it might be to the detriment of the farmer?—I only wish to refer to the principle that personal property should bear its fair proportion of taxation.

25,587. The application of the principle you admit is one of very great difficulty?—Great difficulty.

25,588. You have not considered any method of meeting it?—No.

Agricultural syndicates.

25,589. Your next point relates to agricultural syndicates. I do not quite understand what you mean by agricultural syndicates?—The term has been applied on the continent to agricultural associations, which have been formed for the specific purpose of buying the seeds, manures, feeding stuffs, implements, and so on, and by combination, farmers have been able, not only to obtain these goods at much lower prices, but to obtain goods of a much higher quality. As you may be aware, the French have over a thousand of these different syndicates, and we have several in England, one of which is situated near Nantwich, which is very successful indeed. These syndicates are all described in a volume known as the "Annuaire des Syndicates Agricoles," a large volume published under the patronage of the French Government.

25,590. What do you mean by suggesting that they should receive State recognition?—I think that they should receive the same kind of recognition in England that they do in France. The French Government makes subventions to these syndicates, and I believe that farmers are much more willing to combine for purposes of this kind when the initiative is taken by the authorities.

25,591. You do not mean that they should have any legal status different from that which they have now, but that they should receive some assistance from the State in the shape of a subvention?—I think that the State should initiate their institution, and should also not only recognise them, but subscribe even slightly to their maintenance.

Agricultural education.

25,592. Then with regard to agricultural education, your next point, you have already told us what are your suggestions with regard to the labourers. Do you think that greater facilities should be given to farmers' sons?—Upon this point I have made investigations upon the subject in America and in several of our European countries. Without exception in those countries they have not only the higher class of education, but a good lower class. I saw the other day in Switzerland, in the Canton of Zurich, a school where farmers' sons are boarded and fed, and taught the practice and science of agriculture for a couple of years at 8*l.* a year. This sort of thing is conducted abroad in a most extraordinary style. My fear is that we cannot pretend to compete against the farmers of the future who are being trained in this manner. If it is not tedious to the Commission, I would just like to read two or three notes. In Belgium they have a chief college at Gembloux. They have also three practical and theoretical schools, Ghent, Huy, and Vilvorde. Seven agricultural laboratories, ten agronomes or professors of agriculture who reside in the country districts, and are at the farmers' assistance, and have assistants also. Then they have also six free agricultural schools, and the Government provides annually 400*l.* for purses for the successful students. In France they have an institute, three national agricultural colleges, a number of primary schools, 16 farm schools, 90 county professors, and in the past year they conducted 3,360 field trials. In passing, I may mention that the students and the professors from one of the colleges came to England two or three years ago to see what we were doing; they came to my farm and I took them to several others, including Windsor. They have also in France

Prof. J. Long.
22 June 1894

30 agronomic stations and three agricultural laboratories, two irrigation and drainage schools, 14 cheese schools, besides primary agricultural, sheep, poultry, and milk schools, 18 specialist stations, and in a recent report one of the French officials stated that during the past 10 to 15 years France had reaped a yearly gain of 135 million francs.

25,593. Is this information taken from a report which has just been issued by the Government?—It is all taken from official reports. The whole of this work is claimed to be largely owing to increased facilities and to increased knowledge. Something of the same kind occurs in Germany, Italy, Denmark, Sweden, Norway, Switzerland, and America. In 1892—perhaps you may not have seen this figure—the American Government issued 40 million pages of agricultural matter; they have 63 colleges and schools; the revenue for the year 1892 was 3,444,000 dollars, of which 1,700,000 dollars came from the central government. In addition to this they received for equipment one and one-third million dollars. In the course of the year there were 11,358 students passing through courses varying from one to four years, the cost to the students being from 72 to 320 dollars per annum; the average being 140 dollars or 28*l.* This was the fee which was paid at the University of Wisconsin which I was at last year at this time. Then they have 52 experimental stations.

25,594. (*Mr. Channing.*) Are any of these free schools in the sense that they have scholarships or anything of that kind?—No, there are no free schools. Each of the 52 agricultural experiment stations receives a sum of 3,000*l.* from the Central Government. The total revenue is 200,000*l.* with 20,000*l.* in 1892 for equipment.

25,595. (*Chairman.*) Do you think this system should be extended into this county?—I think something much more extensive than we have should be carried on here for the benefit of our farmers.

25,596. And that each county should have an agricultural expert?—I think it should. I think that the county experimental work which is being conducted now to some extent should not be, as some have suggested, in the form of a distinct station, because I believe that the work that may be conducted at a particular station upon particular land would not apply to every farm, but might be misleading. I think that the work of a teacher or of a professor should be to visit the farmers on their own farms and to assist them in conducting simple experiments for themselves which would be much more valuable than having county stations. At the same time I think there should be central stations.

25,597. Should great attention be paid to horticulture and orchards?—I think so.

25,598. Would these experts advise as to orchards?—Yes.

25,599. Do you think much more might be effected in horticulture and in fruit orchards?—I think we have little or no knowledge in this country on that subject among farmers. We have plenty of orchards in Hampshire, but they are old and diseased, and farmers do not seem to know how to improve them, whereas in other countries they have experts who travel through the country, and teach the farmers to destroy the insects and organisms on the trees, to clean the trees, and to prune, and to graft, and generally to improve the fruit of the district.

25,600. (*Viscount Cobham.*) It is being now done by the County Council, is it not?—We have a travelling teacher in Hampshire, but that is only like a drop of water in the sea. He gives lectures and some simple demonstrations, but I think the work should be done on the farms and in the orchards.

25,601. In many counties they do that to-day; the teachers go about the allotments, gardens, and orchards throughout the county?—I think it is a very desirable thing to do.

25,602. (*Lord Rendel.*) I see you suggest horticultural schools and poultry stations?—I think there should be both horticultural schools and poultry stations for experimental work. If we are to be able to maintain our own against foreign exporters, I think we ought to adopt the measures that they adopt themselves.

25,603. Then in other respects what intervention from the State would you suggest to the Commission would be valuable?—I think that the State, so far as its schools are concerned, should take the initiative, and establish such schools in suitable districts.

Prof. J. Long.
22 June 1894.

25,604. Now, as regards horse breeding?—My remark is simply this: the Government have done a very great deal, indeed. I only think that there should be more horses at the disposal of the farmers who have to send now very great distances, and who, I know personally—because I have had nominations myself—have had to put up with refusals because of the few horses there are standing. Further, it sometimes happens that the person at whose farm, or at whose establishment the stallion stands, makes his own charge, which is sometimes ridiculously large and which a farmer cannot afford to pay. You may pay two guineas for the fee, and you may be charged six or seven guineas for the keep of the mare. Horse breeding.

25,605. Would you suggest some authoritative regulation of such minor charges?—Yes.

25,606. Now in respect to cattle breeding, what have you to say?—We want something upon the lines of the Shorthorn Society for cattle for the production of milk. In some foreign countries—of which Denmark and Switzerland are two—subventions are given for the service of bulls among the farmers. Some two years ago the British Dairy Farmers' Association attempted to found a herd book for milk cattle. They failed because of the great expense attending the operation. It was found essential that inspectors should be sent to the different owners of the cattle to test the milking power of the cows, and this was altogether prohibitory. I think that if we are to follow in the footsteps of other nations we ought to have a herd book for milking cattle as they have, but only the Government could afford to establish it. Cattle breeding.

25,607. Do you think that the time has come when in those respects intervention is necessary, and would, therefore, be tolerated?—I think so.

25,608. Have you any observation to make with regard to cheeses?—Our national cheeses are Cheddar, Cheshire, and Stilton, but we are consuming an increasing quantity of foreign cheese such as Gruyère, Parmesan, Camembert, Brie, and other kinds. What I suggest is that we should ourselves take up the manufacture of those kinds of cheeses instead of buying them from the foreign producer, whom we are really helping to make. Take the farmers in Normandy, for example, where Camembert cheese is made. They have been converted from a poor class of men into landed proprietors by the action of our own people in buying their produce, and this since the year 1870, the year in which they commenced to send their butter to us. I can go through the whole of two departments, Manche and Calvados, in Normandy and meet no one hardly but thrifty farmers mostly owning their own land and exporting their goods to England. We can make those goods quite as well as they can themselves, and it only wants the initiative taken. No one cares to take up the matter because of the possible loss at the outset, and, therefore, I think it rests with the authorities to make a start. Cheese-making.

25,609. Do you think that some authority should be constituted by subvention which would be able to give the requisite impulse?—Yes, certainly. Some years ago when I was at Cirencester I had then my own place in Hertfordshire, and we started to manufacture Camembert cheese. We found it a most difficult thing to start for there was no one to help us at all except the French, and they were unwilling to give us any assistance, but in course of time the thing was mastered, and it became a business. I think if any farmers were induced to take up a line of that kind they would deserve recognition, and they should be promised assistance, because it is an industry of very great moment.

25,610. Then what have you to say about flax and beet culture?—I know nothing whatever about beet culture, but with regard to flax I have made the attempt to grow it, and I know others who have done the same thing. It can be grown with success, but it seems to me that the difficulty is to dispose of the flax straw, and there, again, it seems that unless the initiative is taken by somebody—and that somebody can only be the Government—we cannot expect to have a national flax industry. Flax culture.

25,611. As to beet culture I think you said you had no personal knowledge?—I have no personal knowledge of it, but there is a great deal of literature on the subject. It has frequently been brought before the Beet culture.

Prof. J. Long. 22 June 1894.

people, and I do not see why we should not be able to produce beet sugar as well as the French and Germans.

25,612. (*Mr. Whitehead.*) Would the climate be suitable?—It is claimed by those who have a knowledge of the subject that it would be suitable.

25,613. Is it not claimed by others that it would not be so?—It is; but I might remind you that it is made in the South of Sweden very largely. Two years ago I was staying in the South of Sweden, and the Director of the Agricultural College there gave me full details of the work that they perform, and told me that they reaped as much as 40*l.* a hectare of the sugar they produced. The climate is no better than ours.

25,614. (*Lord Rendel.*) Your opinion seems to be that there should be a greater readiness to leave the beaten track with regard to agricultural production?—I think so.

25,615. It is with that view that you wish to suggest these various forms of produce, the success of which you have observed abroad?—It is. I think we are too conservative, and that we could do a deal more than we do if we were to take the trouble.

Fruit growing and the canning industry.

25,616. Now we come to fruit planting. What have you to say on that?—The planting of fruit trees is a matter which the farmer abroad is encouraged to do by being offered rewards for successful planting both in France and in Italy. Although you can go within a very few miles of London and see magnificent planting which pays very well indeed, and the men are willing to undertake the work without any prospect of compensation in case they leave their land, still, when you go farther away into the country you will find that men are unwilling to do so, either for want of knowledge or for reasons which they know best about as regards compensation. So long as we import the goods from foreign producers which we can produce at home, I think there should be some encouragement given to farmers to produce this class of goods.

25,617. What have you to say about the canning industry?—That is a matter that I observed in the States. Wherever vegetables of a certain class are produced, such as peas, French beans, and tomatoes, and fruits of various kinds the American people are taught to preserve, not by hermetically sealing in the cans, but by using glass and earthenware jars. It is curious that we do not understand the thing in England, but directly a person goes to America he or she is taught to do this work, and they do it for the winter. I have relatives myself there. The thing is very simple. They do it regularly, and the industry is very large, but we do not attempt this work at home.

25,618. From your own knowledge do you see any reason why this industry should not be established in the British Isles?—Certainly not. It is extremely simple, simpler than jam making.

25,619. In respect of fruit you would regard it as important owing to the precariousness of the markets possibly?—I would indeed. In the report of the Assistant Commissioner for Kent, there is a statement made that the people in the village were allowed to go and pluck the fruit because of its abundance; in another case the statement was that so many hundred weights were thrown away; those might have been canned.

25,620. Have you been aware of cases where fruit sent to a market must be sold at whatever price is offered?—I have, from our own district of Botley. We have a large strawberry district in Hampshire.

25,621. As I understand you would suggest that if canning was resorted to, it would give the grower of the fruit some better command of his market?—Yes, it would.

See control station.

25,622. As to the need of a seed central station, I think you you wish to make some observation?—Yes. If an English farmer desires to obtain information with regard to the seeds he uses, he must send the seeds to one of the experts of an agricultural society. I do not wish to say one word to diminish the importance of the experts in question, but I contend that they have not the experience, and consequently the knowledge which is obtained by men who are doing the work every day of their lives under first class conditions. On the Continent, and particularly at Zurich, where a large party of English people were a fortnight ago, they have a seed control station, and at the Zurich station a large proportion of the seeds sent for examination are sent by English, Scotch, and Irish merchants, simply because they have no place in England where they can send their seeds. This station costs about 1,200*l.* a year. It has at its head the very first man in Europe; the first man because of his experience, and the work is done in a very first class manner. Yet we have no such place in England where the fees would infinitely more than pay for the cost of the whole concern.

Prof. J. Long. 22 June 1894.

25,623. You yourself, I understand, inspected this establishment recently?—I did, twice.

25,624. In company with a number of others?—With 150 of the British Dairy Farmers' Association. I was Chairman of the recent Conference in Switzerland, and we went there among other places.

25,625. They regarded it as a subject of such interest to themselves personally, that they took that trouble?—They did.

25,626. (*Mr. Everett.*) What is the object of it?—To test the purity and germinating power of seeds of all kinds.

25,627. (*Mr. Channing.*) Is that as an alternative to the use of the Adulteration of Seeds Act here, in order to check the frauds?—No, not an alternative, but in addition to it.

25,628. Are the samples sent by post?—Yes. In France there are, and in England there were, firms where dead seed is sold for the express purpose of mixing with live seed. This has been exposed in the French Agricultural Journals during the past winter. Such a firm did exist in England to my knowledge some few years ago; I do not know whether it does now.

Adulteration of Seeds Act.

25,629. Do you think that the Adulteration of Seeds Act, which was passed some years ago, has had an effect in checking that fraud in England?—It has not had any very great effect. The effect which has been produced upon English seeds has been, I believe, solely or almost solely, owing to the action of the very best class of seedsmen themselves, who are striving very hard to send out a pure article, but then they are in a great minority.

The sale of artificial manures.

25,630. (*Lord Rendel.*) Have you any suggestion to make as to the form which the sale of artificial manures should take?—Yes; this, which is derived from the Swiss practice. In the ordinary way the English farmer buys his artificial manure as nitrate of soda, sulphate of ammonia, or superphosphate, or kainite or basic slag, as the case may be, and he asks for, or he should ask for, the per-centage of soluble phosphate, or ammonia, or nitrogen. But in Switzerland, the chemists at Berne, to whom I am indebted for this information, advise the farmers never to buy a manure in this way, but to buy the soluble phosphates by the pound, and to buy the nitrogen by the pound. That appears to me to be such an eminently excellent plan that I could not forbear recommending it. There seems to be no room for fraud there at all.

25,631. (*Mr. Channing.*) Buy it by the unit?—By the pound. Superphosphate, for example, containing 26 per cent. of soluble, which is a very common manure, we buy by the hundredweight or by the ton, and they buy by the pound at a price fixed by the experts.

25,632. (*Lord Rendel.*) By the pound of soluble phosphates you mean?—Yes.

25,633. Do you consider that is a greater security to the buyer?—Very much greater.

25,634. And one easily realised?—One very easily realised by analysis.

25,635. (*Mr. Little.*) There must be an analysis?—There must be; they must be guaranteed by the seller.

25,636. And where 26 per cent. is guaranteed, is there not generally a contract to pay so much per cent. for what is over, and to receive so much for what is less?—Unquestionably.

25,637. Does it not come to the same thing?—I do not think it does, because in one case you buy your 26 lbs. of phosphates, and if you do not get 26 lbs. you simply ask for the short weight; in the other case you buy your hundredweight or your ton of superphosphate, and you have to go through a long procedure. In the first place, the invoice is generally sophisticated and never very clear. Then you have to get your own analysis under the last Act.

25,638. But take one of your syndicates which you have spoken of. They buy a large quantity for their customers at an agreed per-centage of soluble phosphate,

Prof. J. Long. 22 June 1894.

samples from the bulk are analysed, and if found to be 27 or 28 or 29 per cent. there is an adjustment of the price in one direction; if found to be 25 per cent. there is an adjustment in the other direction; in what way does it really differ from the system you recommend?—If you are buying from a syndicate I should modify my suggestion.

25,639. Practically the system of dealing with a syndicate would come to the same thing as the system you would recommend?—It would, if you are buying from a firm of which you are a member then I think you have nothing to fear.

25,640. I am speaking of a syndicate which buys from a manufacturing firm for its own customers?—Then if I were the syndicate I would buy the pound of nitrogen, or buy the pound of soluble phosphate.

25,641. (*Lord Rendel.*) I understand you to suggest that the buyer gets more security, that he is getting the quantity of fertilizing material he wants by buying it by the pound of fertilizing matter, than if he bought it by the hundredweight or ton of material, leaving the question of the per-centage of fertilizing matter in doubt?—Yes.

25,642. But you do not go beyond that?—That is so.

Waste land.

25,643. Have you any suggestion to make in regard to waste land?—My suggestion with regard to waste land is that it should be given by the Government to deserving men selected from their past history as being likely to improve the land and to make it pay its way. We should only be following the plan of Germany and Sweden in attaching men to the soil who are essential to it and without whom we cannot hope to cultivate a lot of the waste land of the country. The moors of Lancashire, for example, I believe to be perfectly cultivable if they are given to people who have sufficient capital to build a house and to till the soil, but in their present condition they are simply a waste, while men are starving for want of something to do.

25,644. Then you would revert to very ancient customs?—I would in that case, certainly.

25,645. (*Mr. Channing.*) It would have to be done through the local authority, I presume, not through the State?—I do not commit myself to which authority, but I think it could be done.

25,646. (*Mr. Everett.*) These lands do not belong to the State to begin with generally?—No, generally they do not; in Hampshire they do not, except the Crown property in the New Forest.

25,647. (*Lord Rendel.*) Shall I be expressing in a summary way your evidence as bearing first on the relations of the owner to the occupier and their modification as one form of remedy?—Yes.

25,648. And secondly, the whole of the rest of your evidence appears to bear generally upon State aid and intervention, following very much the common practice and the foreign examples which you yourself have been able to study?—Yes, that is so.

Farming in this country and abroad compared.

25,649. (*Mr. Everett.*) You have travelled a good deal apparently and examined a good many foreign customs; have you ever met with a country anywhere taking it all round, where you have seen farming so good as in Great Britain?—No, I have not. There are many reasons why that is not the case. I have seen plenty of farming as good as the best farming we have. The best farming in France is quite as good as the best farming here, but you may travel, as we travelled to Switzerland a month ago, 500 miles from Calais to Bâle and see the very poorest class of farming, owing not to the people but to the land. But if you go exactly across the channel into the northern parts of Normandy you will see farming that would do credit to the very best of our people, but that is chiefly owing to their instincts being similar to ours, to their good climate, their good soil, and to our markets. The same thing occurs in Belgium. In the rich districts where you have a good outlet for your goods, and where nature helps the farmer he seems to be able to do much better and to place more in the soil than he would do under other conditions.

25,650. (*Mr. Little.*) On the question of the relations of landlord and tenant, I think you said that you practically would adopt the Irish system—you would go on the same lines as the Irish legislation has taken?—Yes.

25,651. The effect of that would be, would it not, to convert the present landlords into rentchargers?—No, do not admit that.

25,652. If the tenant at present in possession was given fixity of tenure with liberty to do what he pleased with the land, the landlord would simply have an interest in the rent?—I have not brought the Bill with me, nor the details of it, which I did not expect to go into, but the details of Mr. Smith's Bill, for example, will show you—perhaps you are quite well acquainted with it—that there are many limits prescribed which certainly enable the landlord to be still a landlord.

Prof. J. Long. 22 June 1894

Fixity of tenure.

25,653. (*Viscount Cobham.*) It does not give him power to go upon the farm, except for the purpose of inspection?—Under certain conditions he can take the land back again.

25,654. (*Mr. Little.*) Do you remember what those conditions are?—I do not want to commit myself without having it before me.

25,655. You say under certain conditions the landlord can re-enter upon the land; but are not those conditions that he wants to occupy the land himself, or for members of his family?—Certainly, that is one condition.

25,656. Suppose he wanted it for any other object, he would not have the power of taking it unless the tenant had grossly mismanaged it, would he?—Then I do not think he has anything to complain of in that case.

25,657. Then the landlord would practically have a very small interest in it beyond that of the rentcharge which was reserved to him by some public authority?—I take it that the interest of the landlord is in the land for the rent he obtains.

25,658. Solely that?—Not always, certainly. Many landlords have the property for the purposes of enjoying it, but if you let your land it is for the purpose of some other person's enjoyment.

25,659. Does the landlord have no enjoyment of the land which he lets under present circumstances—is there not the sense of possession?—Certainly, as the owner he has, and I do not see that anything would prevent him from enjoying the same privileges under the new Bill.

25,660. Suppose he is only allowed to manage the land to this extent, that he takes the rent of this tenant or some other tenant; does he not then become in fact a mere rentcharger?—It is a matter of terms; I do not see that at all.

25,661. He has nothing to do with the management?—I quite admit that.

25,662. (*Viscount Cobham.*) The landowner would only apparently be entitled to go upon the land for the purpose of mining or taking minerals, quarrying or taking stone, opening or making roads, fences, &c., viewing or examining at reasonable times the state of the holding, buildings, improvements, and so on?—He has not many more privileges now.

25,663. (*Mr. Little.*) He has the power of resuming possession. Do you think the present tenants—many of whom have entered upon their farms within a very short period—have established a claim to be put in the place of the landlord, and to be practically the permanent owner instead of the landlord?—A great many have and a great many have not.

25,664. Would you, because a few have, or a great many have, give all that privilege?—No; my object in recommending this course is, to give men an incentive to put money into their land, and to improve it.

25,665. Suppose they do not put money into it?—Then they will fail, and the land too.

25,666. Suppose a man has put no money in—you yet give him fixity of tenure?—I would give him privileges which he has every right to enjoy so long as he is accepted as a responsible and good tenant.

25,667. But the man who has taken a farm three months ago at a very low rent is to be the permanent owner of that land?—I would not go so far as to deal with a case of that kind. There might be means found of excepting such a case as that; the principle is what I deal with.

25,668. You would only give fixity of tenure to a tenant who has improved the land, and thus established a claim?—I simply wish to deal with the principle—the details are matters which would be dealt with by others.

Prof. J. Long.
22 June 1894.

25,669. It is scarcely a matter of detail, is it? it is the conversion of the tenant into, at any rate, a part-owner, is it not?—Certainly, I quite admit that.

25,670. It is establishing dual ownership?—I think if I take a farm I am entitled to be considered as worthy of being retained upon that farm so long as I do it justice, and put my capital into it, and I think if I do that I am entitled to have that capital secured.

25,671. Can that capital not be properly and fairly secured without giving you fixity of tenure?—I should very much question it. The present Act is entirely a failure in that respect.

25,672. Then you say you are willing to adopt something like the Irish system—are you acquainted with what the Irish system of tenure was?—I know the Irish system is the process or the growth of a great many years.

25,673. Before the recent legislation do you know what were the relative positions of landlord and tenant?—I should like to add that I did not use the term "Irish system" at all—the Chairman put that into my mouth.

25,674. I understood that the Chairman asked you "Is not this the introduction of the Irish system," and that you admitted it was?—That is so, so far as dual ownership is concerned.

25,675. Then was not the principle upon which the Irish legislation was based this, that the tenants had made all the permanent improvements, and the landlords had made none?—I believe it was.

25,676. Is that the case in England?—No, it is not.

25,677. Then there is a difference between the case of Ireland and England?—But I am dealing with the future, and not with the past.

25,678. You heard the last witness describe the relations of landlord and tenant in Cheshire?—Yes.

25,679. And his own views as to liberty of action?—Yes.

25,680. You are acquainted with many different parts of England, I believe?—I am with Cheshire very well.

25,681. And with many different parts of England?—With many parts of England.

25,682. Do you know the east of England at all—Lincolnshire?—Yes, but I do not know it very well.

25,683. Do you think that there, there is any feeling in that county in favour of this interference?—I do not know Lincolnshire sufficiently well to speak to that.

25,684. (*Mr. Gilmour.*) I notice that you advocate a good deal of Government assistance in carrying out a great many of these, what you suppose to be remedies?—Yes.

25,685. In those countries which you have visited, where you have pointed out that a great deal of Government help has been given, are the people employed in agriculture in a very much better way than the agriculturists in this country?—I think they are decidedly better, but I would not say very much better.

Prof. J. Long.
22 June 1894.
Condition of agriculturists in this country and abroad.

25,686. Looking to the fact that the agriculturists in this country, as a rule, stand upon their own basis in carrying out matters with comparatively little direct Government help, is the state of those agriculturists in foreign countries sufficient to warrant the introduction or the interference, I may say, of Government in this country to the extent that you speak of?—I think it is, because I believe that the introduction of State aid abroad has been mainly owing to the lapsing condition of farming, and that as State aid is in consequence calculated to vastly improve the condition of farming abroad we should be left behind unless we follow their example—we must keep pace with the times.

Horse breeding.

25,687. In regard to the one question of horse breeding that you spoke of, did you refer to a greater increase in the number of thorough-bred stallions?—Yes; but I omitted to refer to what I think is essential, namely, the Government supply of shires or of cart-horses.

25,688. In most parts of the country is that not very fully met now by the private studs of private owners?—It is not; the fees are too high.

25,689. What is the sort of average fee for a fair agricultural shire stallion in your part of the country?—There is one horse that travels at three guineas, but I prefer not to characterise the quality of the horses.

25,690. But there is in your country a genuine want of good agricultural stallions at the present moment?—Yes.

25,691. Seeing that there is that want, are there no owners of horses that show any intention to fill up these vacancies?—It is one of those parts of England where there are very few cart-horses bred of any quality—almost none in fact.

25,692. Has it been proved to be not a suitable country for horse breeding?—The land to the south of Hampshire is very deficient in lime, and the stock we grow is deficient in bone, consequently we have very few big horses.

25,693. That would point to the fact that it was not perhaps a country where the Government would be altogether justified in encouraging horse breeding to any great extent?—On the contrary, I think it is more desirable to introduce good blood into countries where the stock of the country has depreciated through climatic and soil conditions.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Forty-eighth Day.

Thursday, 28th June 1894.

PRESENT:

THE RIGHT HON. GEORGE JOHN SHAW-LEFEVRE, M.P., IN THE CHAIR.

The Right Hon. HENRY CHAPLIN, M.P.
Sir ROBERT NIGEL FITZHARDINGE KINGSCOTE, K.C.B.
ROBERT GIFFEN, Esq., C.B.
CHARLES ISAAC ELTON, Esq., Q.C.
Captain OWEN THOMAS.
FRANCIS ALLSTON CHANNING, Esq., M.P.
JOHN CLAY, Esq.
CORNELIUS NEALE DALTON, Esq., C.B.
ROBERT LACEY EVERETT, Esq., M.P.
JOHN GILMOUR, Esq.
GEORGE LAMBERT, Esq., M.P.
HERBERT LYON, Esq., *Secretary.*
R. T. CRAWFORD, Esq.
FREEMAN THOMAS, Esq.
Assistant Secretaries.

Prof. J. Long.

28 June 1894.

Professor [JAMES] LONG recalled and further examined.

Dairy instruction.

25,694. (*Mr. Channing.*) First I want to ask you whether you wish to give some further suggestions as to dairy schools, and the expansion of the Institute of the Dairy Farmers' Association?—Yes I do.

25,695. Will you kindly give them to the Commission?—What I wish to suggest to the Commission is this, that in view of the very extraordinary efforts which are being made in foreign countries to perfect the dairy system, which I may mention in passing really forms the second branch of agriculture, we ought to take some steps in this country to improve our own position. So far we have only a very few schools which have very small grants, and which are thereby enabled to do very little work indeed. We have an Institute in connection with the Dairy Farmers' Association which was formed upon my own initiative, and which carries on work near Aylesbury. We receive from the Government 250*l.* a year, and we expend from our own funds nearly 200*l.* Last year the expenditure was nearly 1,800*l.* During the course of the year we had 108 pupils compared with 87 pupils in the previous year. These were under tuition for an average period of 4 weeks, equal to 432 pupils for one week. In addition to those, 75 students underwent a course of six or ten days' instruction at the travelling dairy school in the county. At four examinations for the certificates and diplomas granted by the Association now under the auspices of South Kensington 58 candidates presented themselves, and of these 35 were successful. From March 1st to May 31st in the present year 31 applications have been received from intending pupils for whom it was impossible to provide accommodation.

25,696. Then you wish greater help from the State I suppose?—We wish a larger grant from the State: first, to enable us to educate more pupils, and next to enable us to carry on work of a still more important character; namely, the higher education of teachers, longer courses for the pupils who do attend, and classes for agricultural chemistry, botany, and bacteriology as applied to the dairy (these three branches of the work really being at the base of the modern system of dairying as conducted abroad, and as shown to us to be perfectly true); also for experimental and research work, and further to assist the 95 per cent. of the farmers who though they make butter and cheese, do not produce the best article. I should like further to say that our school, although it has been the school which has prepared by far the larger number of the existing teachers, received a smaller grant than some other schools, and one school in particular, which is worked by a limited liability company, and which is conducted by a female teacher who was trained at our institute.

Cheese making.

25,697. Have you any suggestion as to expanding the system in other parts of the country, besides the supply of teachers?—My suggestion is only with a view of increasing our own staff and making it a central or a national dairy school, with, as I say, the object of preparing pupils in a more complete manner, of doing experimental and research work, and of endeavouring to establish the manufacture of those kinds of foreign produce, especially Gorgonzola, Parmesan, Gruyère, Camembert, Brie, and other kinds of cheese which are largely consumed in England, but produced abroad.

Prof. J. Long.

28 June 1894.

25,698. Do you think those could be successfully and profitably produced here?—I know it, because I have myself introduced some of them with perfect success. I may further add that in some of the counties of Normandy, particularly in Calvados and Manche, there are farmers whom I have frequently been to see, who have been able since the year 1870 to buy the fee simple of their farms out of the profits they have gained from the sale of dairy produce in the English market—particularly of butter and of Camembert cheese. They are not large farmers, but they are very prosperous, very thrifty, and very industrious.

Butter making.

25,699. Would you like to express any opinion as to whether the butter trade could be reorganised so as to give English farmers a fair chance of competing with the foreign butter trade?—I said when I was here before that there should be a central market in London, and that there should be central markets in the larger provincial towns also, similar to the Halles in Paris, where the producer can send his goods for sale by auction, and where I have myself seen butter realise 2*s.* 1*d.* a pound. We are entirely in the hands of the foreign producer, because we have no organised system enabling the English producer to properly market his butter or small produce. It is possible to send good English cheese of any kind to the merchant, and to get a good price; but the same fact does not apply to the butter or to the fancy cheeses, which are much more profitable.

Rents.

25,700. Now I want to ask you a few questions on the subject of land tenure. We have had a great deal of evidence to the effect that the present depressed condition of agriculture is due almost entirely to the fall of prices; would you think that the excessive rents paid out of the capital of the farmers, and therefore reducing the capital of the farmers, had also contributed to the depression of agriculture?—I most distinctly think so.

25,701. Do you think that the present state of the law is such as to have discouraged, during the whole of this period of depression, the efforts of the best farmers to retrieve their position and to get a better position?—Yes, I think that if the law had been sufficiently liberal and expansive to induce farmers to put their capital into the soil, they would not have suffered so considerably during the last years of depression. I know from my own experience that the better a man understands the land he is occupying the more sure is the profit, whether it be in a bad or in a good year, although in a bad year the returns are of course much less relatively than in a good year.

25,702. As a matter of fact there was great competition in regard to rent in the 70's, and rents were raised to what you might call a speculative value, were they not?—Before the 70's.

Prof. J. Long.

28 June 1894.

25,703. Before the 70's and up——?—Up to certainly the year 1878 or 1879.

25,704. Is it generally the case that reductions of rent in most parts of England began to be made at too late a period to really help farmers?—Where reductions have been made they have certainly been too late; but in my experience there are many parts of the country where there have been very few reductions at all. Many remissions of more or less extent, but very few reductions. In some parts of the country the rents are maintained to-day.

25,705. (*Chairman.*) Do you mean in Hampshire or Hertfordshire?—I mean in different parts of England.

25,706. (*Mr. Channing.*) What parts specially?—Principally in the midland counties, in those counties where farmers are situated in the best districts, near to great lines of railway.

25,707. (*Chairman.*) And near great towns?—Near great towns.

25,708. Dairy farms?—Farms in general. I could give you an instance or two. During the past winter I myself not only advertised but wrote to land agents and others in all parts of the country to obtain a farm in one of the best counties—good land—and the very few farms that were to let were very highly rented, they were extremely few. But wherever I went I found that rents were maintained at a much higher position than ever I anticipated they were before making the inquiry.

25,709. (*Mr. Chaplin.*) Do I understand that that is limited to farms exceptionally well situated?—I think that refers, in my practice and my experience, to the best counties in England.

25,710. I thought you said in the case of farms that were well situated, close to railways?—Well situated as regards the best lines of railways and the towns in particular.

25,711. Is it limited to that class of farms that you are speaking about?—I do not think it is.

25,712. Then what was the object of that statement?—Because I made my own application, as it were, in those districts which I wished to settle in. I preferred to obtain a farm near a great town or near a great line of railway.

25,713. Yes, so does everybody naturally, but I rather gathered from what you said that it was in those cases you had observed chiefly that the reductions were wanting?—Yes, I did observe it chiefly there.

25,714. I only want to know what is the fact in your opinion; is this want of reduction general or is it chiefly the case only in these exceptional instances?—Perhaps you will allow me to still further extend my statement. I have on two or three occasions been acting as a commissioner for two great daily papers, and in the counties in which I made my examinations I found the rents were much higher than I believed they were; I could not have believed that they were so high, it was in three counties.

25,715. (*Chairman.*) You said, I think, that you were making inquiries for a farm in one of those rather favoured districts?—In the midland counties.

25,716. Near to a large town?—Near to a large town, or near to a great line of rail leading to London.

25,717. I think you said you found very few farms vacant?—Very few farms vacant.

25,718. And that the rents were at the old rates?—At the old rates, and the farms that were not vacant—because I have been down to several districts—are maintained at a very considerable rent, I could not have believed it.

25,719. (*Mr. Channing.*) It is true, at all events, that in this district which you have examined the farmers who tried to keep up their farms have not got as substantial reductions of rent as the farmers who let down their farms?—I think that is perfectly true.

25,720. I would ask whether your opinion applies to the parts of England with which you are specially acquainted?—That is so.

The Agricultural Holdings Act.

25,721. An objection was taken to the Agricultural Holdings Act of 1883 that it did not protect the best farmers—those who wanted to remain on their farms—but gave compensation to the less desirable farmers, namely, those who were going away?—That has been so ever since the Act was passed.

Prof. J. Long.

28 June 1894.

25,722. Do you think that omission in the Act is one of the legal difficulties which have operated to the detriment of agriculture since then?—It is the greatest blot in the Act, and the greatest misfortune for agriculture.

25,723. In the case of those farms where the improving farmer has kept up the value of his farm, is it not the case that by the refusal of an adequate reduction he has really been rented on his own improvements? Yes, that is so.

25,724. That has been going on for years, has it not?—Certainly it has.

25,725. Then it would be correct to say that the Act, with the exception of the agreements which it has led to, has rather deterred good farming than encouraged it?—I think it has.

25,726. As I understand your evidence, it is your opinion that we ought now to place the relations of landlord and tenant on a fixed and business footing by statute, and not leave it any longer to a mere question of reliance on the good will or good faith of the two men?—I think the thing should be put upon a distinct business footing, and neither left to so-called freedom of contract, nor to anything else.

Freedom of contract.

25,727. Is there any freedom of contract in farms?—There is no freedom of contract at all: it is impossible.

25,728. (*Mr. Elton.*) Are you speaking of the western part of England or of England generally?—I am speaking of England generally.

25,729. You say there is no freedom of contract?—Not in my judgment.

25,730. (*Mr. Everett.*) Not to-day,—not at the present time, when farms are going begging all over the country?—With regard to the eastern counties, or rather Essex and Suffolk, where there is a great deal of very bad land, I can only say that there might be freedom of contract; but the farms are not worth having at a gift where they have been abandoned in consequence of the failure of the landlords in the past to meet their tenants and retain them.

Reduction and remission of rents.

25,731. (*Mr. Channing.*) Do you know any cases in which, when the farmer has died, his son or widow has taken on the farm, and has been compelled to take it on at the old rent, instead of having a reduction, as other new tenants would have?—I do not know of a case of a widow.

25,732. Is it generally the case, then, that with regard to an old tenant, whether he remains or whether his family take it after him, he has or they have to go on at the old rent as far as it is possible, instead of having the ample reductions which have been given to new tenants?—I know plenty of cases in which old tenants have been allowed to go and new tenants have come in at reduced rents.

25,733. Do you approve of the system of temporary remissions, or do you think that is not beneficial to agriculture?—I think it is a very improper principle. It may be very agreeable in a certain year, but it induces a man to stay upon a farm where he has been losing money only to lose more.

25,734. (*Mr. Chaplin.*) Do I understand this to be your opinion: that if a tenant has suffered very severely from some accidents of the season, or the climate, it is a wrong and a bad principle on the part of the landlord to make him a remission for that year in consequence?—That is putting the question in another form.

25,735. Certainly it is; it is the distinct form. You laid it down as a distinct principle that remissions of rent were injurious and wrong in principle. (*Mr. Channing.*) As compared with permanent reductions?—May I put it in this way: in the case of a tenant who has been succeeding on his farm—and I am happy to say there are plenty of them even now—a bad year followed by a remission on the landlord's part is a generous act on the landlord's part.

25,736. (*Mr. Chaplin.*) Then it is not wrong?—Not in a case of that kind; but I am speaking of the principle as applied to those tenants who are year by year losing upon their farms because of high rents.

25,737. (*Mr. Channing.*) I understand you to mean that a permanent reduction which would allow the tenant to reap the benefit of his own improvements, and something like a fixed fair rent in the future would

Prof. J. Long. — 28 June 1894.

place him in a very different position than if he had to go and depend upon a temporary remission?—Entirely, He does not know where he is at all.

25,738. In the latter case he is face to face with the old high rent whenever it happens to suit the landlord to impose it upon him?—Exactly so.

25,739. Those considerations have led you to take the view of supporting fixity of tenure, and fair rents, and free sale, I understand?—Certainly.

he Agri-ultural oldings -t, aluations.

25,740. You think the Agricultural Holdings Act is inadequate and unsuccessful in its operation?—Perfectly inadequate: perfectly unsuccessful.

24,741. Was the obvious intention of the Act to put an end to the old system of rule-of-thumb valuation based on outlay, and to secure to the tenant full compensation for the increased value his operations have given to the farm?—I believe it was.

24,742. That was the intention?—I believe it was.

24,743. But the Act was so drawn that the valuers have been able to set that aside and to introduce the old rule of thumb?—Yes.

25,744. How have the valuers treated that principle of the Act?—As a matter of fact it is not altogether the valuers who have caused the difficulty. The cases arise in this way. The tenant farmer knows perfectly well by what has happened before that if he makes a claim for unexhausted improvements he will be met by a counterclaim of still larger dimensions. In my own county a valuer who has perhaps one of the two or three largest practices in the county, told me himself, that he never knew but one instance in the county of Hampshire in which the claim having been made under the Act it was not met by a counterclaim considerably greater. He is a man who supports the Act generally in every other way.

25,745. That would be as to the purpose of the Act; but my question was rather as to the way in which valuers carried out their valuations. As a matter of fact do they award to the tenant the added value that his improvements have given to the land, or do they estimate the compensation by an estimate of the duration of the improvement based upon the outlay?—I have not a wide experience of what the valuers do, but in the cases that I do know anything about, the valuation, or the basis of valuation, is entirely unknown to the tenants and quite inadequate.

25,746. As a matter of fact, do you attach importance to the three F's because this principle of valuation in your opinion has failed, or why?—Because I think if you want to get the most from the land, and to fix a satisfied and prosperous tenantry upon it, you must give them a very distinct interest in the soil and induce them in every possible way to put their labour and their money into the soil.

Fixity of tenure.

25,747. By proposing fixity of tenure would you really be doing more than ask bad landlords to do what the best landlords do?—No, I think fixity of tenure exists to-day in form in the case of many good landlords, and I would not wish for more than they give; but it is the majority who are bad, who do not do their duty to their tenants, whom I should like a law passed to control.

Freedom of sale.

25,748. Do you think freedom of sale would diminish the inducements or increase the inducements for the best tenants to remain on the land?—I think if you give a man fixity of tenure, and allow him under certain conditions to improve the farm by adding his capital to it you are bound to give him freedom of sale under certain conditions. I should like to add that as regards fixity of tenure I would make certain reservations—that a tenant should not be allowed to remain in possession of a farm if he did not pay his rent, or if he committed wilful waste and destruction of the property, and further if he sub-letted the farm without the consent of the landlord he should not be allowed to remain; nor if he became bankrupt; and if the landlord required the farm for himself or for his son I would certainly give him possession on condition that he paid the outgoing tenant compensation for the disturbance he created. Further, if the estate required to be improved by throwing a farm into it, then I think the case should be referred to a board or to umpires, and if they determined that it was essential to the estate that it should be thrown with it the tenant should have notice to leave; the same in case small holdings or allotments were required.

Compensation for disturbance.

25,749. How would you define compensation for disturbance? Would it be merely the loss of the tenant in the process of removal, or what else would you give him compensation for?—Supposing a man is not following a business, but, as the Chairman put it last week, he is simply farming upon a sheep farm or a corn farm, he should be paid what the valuers considered to be the value or the sum of money that he would lose by the removal from one farm to another—not merely the expense attached to the removal itself, but something to compensate him for the loss which he certainly would sustain before he had arrived, upon a new farm, at the same position at which he left the old farm.

25,750. (*Chairman.*) Then it would be something analogous to the compensation for disturbance under the first Irish Land Act?—Something similar to that, except that I would extend it to larger farms.

25,751. (*Mr. Channing.*) As I understand your evidence, you put this suggestion of compensation for disturbance as an alternative, and you would prefer, yourself, to have fixity of tenure under statutory conditions, with these powers of resumption by the landlord on reasonable grounds?—In case fixity of tenure were not given I would give it as an alternative, but at the same time if you give fixity of tenure I think you must also compensate a man under the headings that I have already enumerated, because if he leaves the farm, whether it be under the one case or the other, he must lose something by so doing.

Land Courts.

25,752. Though these questions between landlord and tenant have to be determined by some form of arbitration, have you formulated your own idea of what would be the best form of land court or court of arbitration?—I should not object either to a land court formed of a county court judge and two men appointed by the county council, one representing each interest, or to a board of arbitration formed by the Board of Agriculture in the same way.

25,753. Do you think a district council would be a suitable body for appointing assessors?—The district councils being still unformed, I think I should prefer to see how they are constituted before giving a reply.

Judicial rents.

25,754. Now just one final question with regard to the rent: Do you think your experience of competition rents is so unsatisfactory that you would prefer to have a rent fixed by a court of arbitration as you suggested?—I should prefer certainly to have not the first rent—I should not go so far as that to-day because the thing is still so much *in embryo*—but with regard to existing tenants I would give a man who has been palpably failing in his farm through no fault of his own, the opportunity of going before a court of arbitration to have a judicial rent fixed.

25,755. (*Chairman.*) For what length of term?—I should not mind whether it was five or seven years, but I should not like to fix it for a long period.

25,756. And renewable again after that?—And allow either the landlord or the tenant to appeal to the board to renew the rent at the end of the period of five or seven years.

25,757. For another period, and so on?—And so on.

25,758. *Ad infinitum?—Ad infinitum.*

25,759. (*Mr. Everett.*) If the landlord had a mortgage on his farm would you allow him the same power with reference to that if you cut off by the court the source of his income by which he paid the interest on that mortgage?—For the good of the country I should be willing to do anything—for the good of the people.

Results of farming

25,760. (*Chairman.*) Your experience in your farm in Hampshire has not been favourable—it has not been profitable I think?—Not until the present year.

25,761. How long have you had that farm?—Six years.

25,762. Have your losses been mainly in the last two years?—Chiefly; the first year was a very bad year owing to the farm being in a very bad condition.

25,763. But after that until the last two years did you do fairly well?—I cannot say that I did fairly well. The first year and the second year were mainly occupied in cleaning the farm and bringing it into condition; the third year was a fairer year, and then we had two very bad years, and now there is a good year.

25,764. This year the prospects are good?—Very good.

25,765. Very good?—As farming goes.

25,766. Is it mainly dairy farming?—Sheep and dairy farming.

Particulars of agreement.

25,767.—In spite of all your bad experience there, you have taken another farm in Hertfordshire?—Yes, I have.

25,768. I think you said the rent there was about 25*s.* or 30*s.* an acre?—Between 25*s.* and 30*s.* an acre.

25,769. Have you taken it on lease?—I have agreed to take a lease.

25,770. You have an agreement for a lease?—I have really taken the fag end of a lease from an outgoing tenant.

25,771. For how long?—His lease expires on the 31st March.

25,772. You have agreed with your landlord, at the expiration of that, to have another term?—I have agreed with the agents.

25,773. For how long?—I think it is for 7, 14, or 21 years.

25,774. At your option?—Yes, at my option.

25,775. That is to say, you may give it up at the end of 7 or 14 years?—Certainly.

25,776. But would it bind the landlord for the 21 years?—No.

25,777. Could he give you a notice to go at the end of the seven years?—The option that I propose is mine.

25,778. I mean yours and not his?—Not his.

25,779. Therefore he is bound for 21 years?—If I choose, yes.

Judicial rents.

25,780.—Now in a case like that, do you think after a bargain of that kind it would be right that you should have the right of appealing to a court for the determination of the rent?—This is very delicate ground.

25,781. That is why I put the question?—I have for many years past spoken my mind pretty freely and with grave consequences to myself. I may say, however, that I should be quite happy to take the farm as it is without restrictions whatever, or conditions whatever.

25,782. The question I want to put is whether in the case of a man coming into a farm under an agreement which he may hold for 21 years with the option himself of leaving at 7 or 14 years, you think under those conditions, whether it is your own case or anybody else's, that it is fair that he should be able to appeal to a judicial tribunal to fix the rent?—Certainly. The suggestion would apply to farms of all descriptions and tenancies of all descriptions.

25,783. I put the specific case where a man has made a specific agreement binding his landlord for 21 years with the option to himself of going at 7 or 14 years; whether under those circumstances it would be right and fair that he should be able to appeal within a few months afterwards to a judicial tribunal to fix the rent?—I do not think the question should be put as applicable to one particular class of farmer.

25,784. I put it generally, to cases of that kind, because there may be many cases of the kind. (*Mr. Chaplin.*) It is a plain question?—But it is a specific question.

25,785. That is why it wants a specific answer; it is very simple?—I cannot commit myself to any specific answer of the kind. I will answer it as regards agriculture in general.

25,786. (*Chairman.*) The case cannot be a very uncommon one of a person going into a farm and making an agreement terminable either at 7, 14, or 21 years, to pay rent on terms which he has come to with his landlord after full negotiation; what I want to ask is whether, under those circumstances, be the tenant who he may, it would be fair that, immediately after that, he should be entitled to go into court for the determination of the rent?—I think it would be fair in the case of judicial rent where permissible to debar a man from claiming for five or seven years, as the case may be, after entering a farm, because he would then have made an agreement with his landlord to pay a certain rent, and I do not think he could expect to go to the board of arbitration to have a rent fixed within five or seven years afterwards.

25,787. (*Mr. Dalton.*) But would you say that the landlord at the end of the seven years might go into court if he thought that the rent was too low?—Certainly.

25,788. Although he has agreed to let it for 21 years, terminable only at the option of the tenant?—I think what is sauce for the goose would be sauce for the gander in that case.

25,789. (*Chairman.*) Do you not think, under those circumstances, the landlord should be entitled to go into court?—I think he should; I would give him the right to do so in any case if I gave the tenant the right.

25,790. The same as to the tenant?—The same with the landlord, yes.

25,791.—Then I understand you now to say that in such a case for the first seven years or five years, I think you said, the tenant ought not to have the right of going into court?—Not immediately after taking the farm.

25,792. Not after entering into a formal agreement of this kind?—No.

25,793. But then after that, after the seven years are over, you would give it to him?—Yes, I would. I confess the case has not arisen; it is a specific case which has not arisen in my mind or probably in anybody else's, but at the same time I think it would be perfectly just to debar him from going into a court to fix a rent until he had been on the farm a certain time; I think five years would be quite fair.

25,794. Would you apply that rule to other cases than where the rent has been fixed for seven years—would you apply it to the case of a man who goes into a farm under a yearly tenancy, or would you say that at the end of the year he should be entitled to go into court?—No, I would not give him permission to go under five years.

25,795. Then you would preserve freedom of contract for five years certain; it is very important to ascertain exactly how far you are prepared to go?—I should not like to answer the question on the spur of the moment.

25,796. (*Mr. Channing.*) If a system of land courts to fix fair rents is adopted, would not the first step taken on any agreement being come to between a landlord and a tenant be to register that agreement in the court and to obtain the assent of the court to it?—Yes, unquestionably so.

25,797. That is the landlord and tenant would not be such fools as to enter into an agreement with either party able to take that step at once?—I do not think they would.

25,798. (*Chairman.*) That is dealing with another point; the question I have been raising is this: where a tenant comes into a farm under an agreement with his landlord, if he is a yearly tenant, should he have a right to appeal to the court within the five years or not?—I do not see any objection to it at this moment.

25,799. Do you think, having come into possession of his farm under an agreement for a yearly tenancy, that the next year he should be entitled to appeal?—No, I did not say that; I do not see any objection to his being refused permission to appeal under five years.

25,800. Then you think that for five years at all events freedom of contract should be preserved?—The agreement should be preserved. I do not look upon it as freedom of contract, because I do not believe in it. I have no freedom of contract in my agreement.

25,801. I want to know what your idea is; it seems to me almost to follow from what you have said, that freedom of contract under your scheme would be preserved for five years?—The agreement arrived at between the two parties would be preserved for five years.

25,802. That would be binding for five years?—Yes.

25,803. That is to say, for five years after entering upon such a contract as that, the tenant would not have the right of going into court?—He would not.

25,804. At the end of that five years either the landlord or the tenant might do so?—I answer the question without previous preparation, but I think that five years would be fair; I do not see any reason why it should be withheld.

25,805. Now, I presume that a very large number of farms have been newly occupied by tenants quite lately in these times of depression, under yearly agreements;—Yes, a good many have.

25,806. You would maintain those agreements subject to either the landlord or tenant going on if they think

Prof. J. Long.
28 June 1894.

Prof. J. Long.
28 June 1894.

fit, it being a yearly tenancy, for five years?—Yes, I think so.

25,807. And at the end of that time you would give either party the right of going into court?—I would.

Security of tenure.

25,808. (*Mr. Chaplin.*) I think you told the Commission that in your opinion, if tenants had greater security than they have, by law, farmers generally would have farmed better, and their losses would have been much less?—I think so.

25,809. Are you not aware that some of the witnesses before us have maintained that with the best of security, or as good security as they could desire, the more they have spent upon their farms the greater has been their loss?—I have read something of that kind.

25,810. Does that not shake your opinion at all?—Not in the least. I do not believe it.

25,811. Can you have any greater security than the ownership of the land?—Any greater security than the ownership of the land?

25,812. Can any tenant farmer have a greater security than the security of the farmer who farms his own land?—No, I suppose not.

25,813. Are you aware that some of the witnesses, farmers of great reputation, whom we have had before us, have told us that although they farm their own land their losses have been heavy in the extreme?—I can quite believe it.

25,814. Is that not inconsistent with saying that greater security would have ensured them against such heavy losses?—I do not think it is at all.

25,815. Why?—I know a good many men who farm their own land, and they are the spending class who like to enjoy life, and who do not stop at home, and act as working farmers usually do; they are not the class of men who are making farms pay in Essex.

25,816. The evidence was not limited to Essex. I am speaking now of the evidence which was given in connection with a good farm and very good land in the county of Suffolk, where the witness stated to the Commission that he farmed his own land, had every security in the world that the law could give him, and yet he had been a very heavy loser?—Yes, I can believe it, in a bad county, in the past two years.

25,817. But on a good farm in a bad county?—No, I do not believe it.

25,818. Then you would not be shaken by any of the evidence that has been given by witnesses of that description?—I should not indeed.

25,819. You would put your knowledge and experience against theirs, however high their reputation might be?—There must be some reason why the man owning his own land, if it is good land and well farmed, could not make it pay its rent.

25,820. Is there not a sufficient reason; if the price of the produce does not repay them for the cost of production, then they must lose?—That would appear *primâ facie* to be so; but even now I contend that, with fair rents and fair conditions, farming is a business in which men can pay their way.

25,821. And the fact that witnesses of repute owning their own land have told us that they have been unable to make it pay does not in the least affect your views that the losses are owing, as you say, in great measure to the want of security of tenure?—No, not at all. I can give you a far greater number of persons who pay high rents and make it pay. A gentleman behind me is an example.

25,822. These high rents that you speak of depend upon the quality of the land?—The quality of the land and the skill and industry of the farmer.

Landlords.

25,823. I think you stated, if I caught you correctly, that in your opinion the majority of the landlords were bad?—I should like to hear the line quoted—I did not mean bad in that sense; I believe I qualified the remark.

25,824. I do not want to ask it if you did not make the assertion?—I should like to have the reply read to me.

[*The shorthand writer read the witness's answer to Mr. Chaplin.*]

25,825. Do you adhere to that statement that it is the majority who are bad?—I should like the word "rather" interpolated.

25,826. (*Mr. Elton.*) "Rather bad"?—No, "who are bad, or rather who do not do their duty."

Prof. J. Long
28 June 1894.

25,827. (*Mr. Chaplin.*) Do you draw any great distinction between being bad and not doing their duty?—The word "bad" is a very expressive adjective, and those who do not do their duty I would not include in the same category at all. The meaning, the interpretation of the term is quite different.

25,828. Are you aware that we have had witness after witness before the Commission from various districts of the country who have told us that they have no complaint of their landlords; that their landlords have behaved generously and well, and that their mutual relations, generally speaking, are of the most friendly description?—Yes. I have heard the same remarks made at public meetings by men who say just the reverse behind the landlords' backs, repeatedly.

25,829. Then the evidence of such witnesses as I have described does not shake or alter your view that the majority of the landlords are either bad or rather neglect their duties?—The majority of the landlords do neglect their duties, yes.

Reductions and remissions of rent.

25,830. When you spoke of remissions only being made in the Midland counties I do not think you explained to us precisely what you included in the "Midland counties"; would you state what you mean by that?—I should take Buckinghamshire, Warwickshire, Northamptonshire, parts of Bedfordshire and Hertfordshire, parts of Nottinghamshire, Staffordshire, Cheshire, in fact I might extend the list still further.

25,831. In all these counties I understand you to say there have been no permanent reductions of rent made?—No, I do not say that.

25,832. What is it you mean then; I thought you said only remissions had been made?—I was referring to my own investigations in the Midland counties.

25,833. I mean according to your own investigations, no permanent reductions in those counties had been made?—I think the remark I made was that the rents were much higher than I had anticipated.

25,834. The remark I was referring to was this; that in the Midland counties remissions only of rent had been made?—I did not bind myself to that statement.

25,835. That was the statement. I will refer to it if you wish, but as long as you do not adhere to that, that is quite sufficient?—It is not sufficient for me; it would not be sufficient for me to contradict myself.

25,836. If it is a misunderstanding, I mean that is quite sufficient; I understand you to say that. What is your view then?—My view is this, that in the counties to which I refer the rents were much higher than I had anticipated; that remissions had been made and that so far as I learned rents had not been reduced.

25,837. That is practically the question that I put to you?—But it is not an absolute reply—"so far as I learned" in my investigations.

25,838. So far as you learned?—I cannot bind myself to what I do not know.

25,839. Then do I understand you have some doubts as to the result of your own information, that it may not be accurate?—Not in the least.

25,840. It is accurate?—I believe my information is quite accurate.

25,841. Then you do believe that there have been no reductions made in any of those counties that you have named?—Not at all.

25,842. I do not see how the two statements can be reconciled?—So far as my investigations are concerned, I believe it.

25,843. (*Chairman.*) Do you believe that your investigations fairly represent the actual state of things in those counties?—I do.

25,844. In other words you believe that in those counties there have not been permanent reductions made?—That must be answered generally, because I cannot bind myself to a statement as to fact.

25,845. No, I do not want you make a statement as to fact?—I believe from my investigations, so far as they have gone, as I have described them, that there have been no serious reductions of rent at all in either county.

25,846. What period do your statements with regard to the reductions of rent include?—During the last eight or ten years.

Prof. J. Long. 28 June 1894.

25,847. Then this I gather to be the direct effect of your evidence; that as far as you know, from investigations you have made, you believe that there have been no permanent reductions made in these counties which you have named, within the last eight or ten years?—No serious reductions.

25,848. I do not, of course, know what interpretation you attach to the word "serious;" that is a limitation of some kind; what do you mean by "serious;" what do you wish to convey to the Commission by it?—I must guard myself in some way as to a matter of fact; of course, if one reduction had been made in one county my statement would be wrong if I said "no;" of course everyone knows there must have been some.

25,849. Were your investigations widely conducted?—As the investigations of an individual in his own interest.

25,850. When you were making these investigations, were they in any way as Commissioner for either of the two great daily papers that you referred to?—No.

Freedom of contract.

25,851. Now, you told us, I understood, that, in your opinion, there is no such thing as freedom of contract in taking a farm nowadays between the landlord and tenant, and then you made the exception afterwards in the eastern counties, where the land is bad—that is so, is it not?—There is no rule without an exception; I think that is fair.

25,852. What is the most important item in your opinion in making a contract for the taking of a farm?—I suppose the rent is the most important.

25,853. The rent is naturally the most important item; you are aware, I suppose, that in some counties of England, according to all the evidence we have had here, most enormous reductions of rent have been made; sometimes as much as 80 per cent.; do you say that acquiring those reductions the tenant farmer has had no freedom of contract?—He has been enabled to give notice to leave; he is free to do that.

25,854. Is it not always in his own power to give notice to leave if he likes?—Practically, but not morally.

25,855. In what respect not morally?—Otherwise many hundreds of farmers would be leaving to-day.

25,856. Why would they be leaving?—Because their capital is invested in their farms; they have very little of anything beyond what is invested in the farm, and they are unable to leave in consequence.

Compensation for improvements.

25,857. But supposing they leave, they get compensation for the improvements which they have made?—No.

25,858. They do not get it?—That is quite a farce altogether.

25,859. Where is it a farce?—Because they dare not claim.

25,860. Why?—Because the counter claim would be larger than the claim.

25,861. Are the counter claims granted unless they are fair?—I am afraid experience shows that they are.

25,862. Are you acquainted with counties where farms are held under agreements, and under customs instead of under the Agricultural Holdings Act?—Not to a great extent.

25,863. Are you acquainted with the custom of Lincoln?—I know the Lincolnshire custom is liberal.

25,864. Do you not know that the same customs, or customs analogous to it, prevail in one of the counties you have referred to, in Nottingham, and in many others besides?—That is quite possible.

25,865. Then in the case of such counties as I am now speaking of, do you still contend that upon leaving a farm a man gets no compensation whatever?—I am guided solely by published cases, in almost all of which, I think, and I have noted them as they appeared, the tenant is mulct in damages and expenses.

25,866. Now, with regard to these counties and customs and agreements which I have been calling your attention to. When you say that a man morally has no power to leave his farm because he would not get compensation if he did, you are not speaking from any wide and actual knowledge of the subject?—Not in Lincolnshire.

25,867. Or these other counties where the customs prevail?—I do not know any county that you refer to, except Nottinghamshire.

25,868. In fact, you are not acquainted with the fact that in various counties of England farms are held under agreements and under customs which do give full and adequate compensation whenever a tenant leaves, and compensation with which they profess themselves entirely satisfied?—I know plenty of counties the custom of which is liberal, but which is not carried out.

Prof. J. Long. 28 June 1894.

25,869. That is the only answer you can give to my question on that point?—I think the answer is quite adequate.

Freedom of contract.

25,870. You told us that there was no freedom of contract in the case of your own agreement; I think you made that statement?—Yes, I did.

25,871. Was that when you took the farm?—When I took the farm.

25,872. How is that? Were you obliged to take it?—No, by no means.

25,873. There was nothing binding on you to take it?—Nothing.

25,874. You could either have taken it or left it, just as you please?—Yes.

25,875. Then you had freedom of contract so far as that?—So far as that is concerned.

25,876. Then in what respect had you not freedom of contract?—This is again very personal. I should be very pleased to tell the Commission if it is not printed.

25,877. But you have told us distinctly; you have made the statement yourself that you have no freedom of contract in taking your farm, a statement which I was quite unable to understand. I am quite willing that that statement should be struck out?—No, not at all; that exists very palpably.

25,878. What?—If I explain what I mean in my individual case, I should prefer that it were not printed.

25,879. Then a one-sided statement would be given to the public. I am quite willing that the whole thing should be struck out if that is your desire; but these statements should not be made unless you are prepared to substantiate them. I am quite willing that the statement that you had no freedom of contract whatever in taking your farm should be struck out, and then the question does not arise?—No; I adhere to my statement distinctly.

25,880. Then in what respect do you say that you had no freedom of contract?—I cannot answer the question if it is to be printed. I shall be very pleased to give a very distinct statement to the Commission.

25,881. (*Chairman.*) Was there something exceptional in your case, then, which prevented your having freedom of contract?—It is what may occur in every lease or agreement.

25,882. That is what I was going to ask, whether, with regard to the case of a tenant farmer taking a farm in the first instance, you say there is no freedom of contract on his part?—I should like to put an answer in this form—

25,883. I am not dealing with your own case, I am dealing with the ordinary case of a tenant farmer entering into an agreement for the first time for taking a farm; should you say there is no freedom of contract on his part?—If an ordinary tenant farmer has an agreement in which the landlord is bound to do certain things in response or in return for the rent paid and the covenants observed, I maintain that there is no freedom of contract, if the tenant is compelled to pay his rent and to observe his covenants if the law does not enforce the landlord to observe his covenants.

25,884. That is not quite an answer; what I was asking was this—when a tenant enters upon a farm for the first time under a new agreement, is there any freedom of contract then?—I look upon it as a mere phrase; so long as agreements exist as they do at the present day under the present law, freedom of contract is a phrase of no importance, it is not real.

25,885. Not even when the tenant enters for the first time upon a farm?—I simply endorse the action of the Government so far as I individually can. The Government does not recognize it, and I do not recognize it either.

25,886. (*Mr. Channing.*) Do you think that any tenant in England could draw up the covenants of his

Prof. J. Long. 23 June 1894.

own agreement in his own terms and get them accepted by any estate agent in England?—That is a thing entirely unknown to me.

25,887. (*Mr. Dalton.*) But what is the meaning of freedom of contract? The ordinary meaning of the term is that either party is to have his own way, is it not?—I prefer not to answer that question at all. I perfectly understand, as a tenant farmer, what it means in practice.

25,888. In other matters, leaving out farming for a moment, what is the meaning of the expression "freedom of contract"?—It means that if two parties meet together to transact business, they are free to do as they choose, either to leave it alone or transact the business.

25,889. But a farmer is not compelled to take his farm if he does not like it?—Certainly not; but there are more farmers than there is land to farm, and so long as that is the case competition must entirely prevent men having freedom of contract; it does do so.

The letting of farms.

25,890. (*Chairman.*) Can it be said at this present moment that in a great part of the country there are more people willing to take farms than there are farms to be let?—Unquestionably. I can give you the name of a well known Scotch farmer I met yesterday at the Royal Agricultural Show who said there were 60 farmers for one farm to let.

25,891. (*Mr. Chaplin.*) Where?—In Scotland.

25,892. Quite so, but does the same thing hold good in Essex?—No, because the Essex land is not worth having at a gift where it has been allowed to go foul.

25,883. Or in Suffolk?—Parts of Suffolk are very bad also.

25,884. Or in Norfolk?—Parts of Norfolk are very good.

25,895. (*Chairman.*) Is it not a fact that at this moment over a considerable part of the country there is a difficulty, not insuperable, but a difficulty, in getting tenants?—A very great difficulty indeed, I admit, in those parts where land is not worth having, but where the land is good enough to enable a man to live the difficulty is not insuperable. I may go further and say that men who occupy good farms, such farms as are almost historic, upon historic estates, would not leave under any consideration.

25,896. (*Sir Nigel Kingscote.*) What is an historic farm, I do not understand?—The Duke of Bedford's for instance; I think I might say Mr. Chaplin's as well, from what every one knows.

25,897. (*Mr. Chaplin.*) Then upon that question may I ask what you have to say upon the county of Lincoln, and how you would account for the fact if your statement is correct, that when one of these historic farms was to let last year it was absolutely impossible to find a tenant?—It must have been because of the impossibility of a man seeing his way to make it pay.

25,898. Yet it was one of what you yourself call historic farms on an historic estate?—They have individually bad farms, unquestionably.

25,899. This was one of the best farms on the estate, and was left in perfect order. Does that shake your views to any extent as to the fact that there was no freedom of contract in taking a farm between the landlord and the tenant?—No, I should say that on these estates in particular you either have to take the agreement as it stood, or leave it. That might have had something to do with the want of a tenant.

25,900. (*Mr. Lambert.*) What legislative enactment could you suggest so as to enable a landlord and tenant to meet upon equal terms?—I suggested fixity of tenure, entire freedom of cultivation, sale of produce that would naturally follow, and free sale of the improvements.

Freedom of sale.

25,901. May I ask you to define "free sale"?—When a man is leaving his farm he should be enabled to sell to the highest bidder, always supposing that the landlord is willing to accept him, and that he should be compelled to accept a responsible man of known capacity to farm; he should be enabled to sell to him the property that he holds in the farm.

25,902. Would the man who is the highest bidder take the farm?—Yes.

25,903. Would that not rather increase the competition for the farms?—I do not think so, because it would require an outlay of capital, and directly that is demanded, I believe the number of applicants for farms would diminish.

Prof. J. Long. 28 June 1894.

Land Courts.

25,904. How would you prevent a man from bidding high for a farm and getting into it, and then impoverishing it, and leaving it?—I would provide that if a man committed waste or dilapidation, or farmed in a glaringly bad manner, the case should be referred to the Board of Arbitration, and he should be expelled at once.

25,905. Do you suggest that the Board of Arbitration should be universal in this country for the settlement of disputes between landlord and tenant?—I do not see any other course, but to have it universal. I think it is impossible to separate the good cases from the bad, you must take them as they come.

25,906. You say you would give compensation for disturbance. What is it you mean by disturbance?—I explained that in my evidence in chief.

Judicial rents.

25,907. Presuming that a tenant and a landlord could not agree upon rent, and they went to a land court, and the rent was by this land court reduced, would you compel the landlord to accept that rent?—If it were reduced by the Land Court.

25,908. Yes. Would you compel the landlord to accept the rent?—Certainly.

25,909. Presuming he did not choose to accept it, what would be the result?—If it were the law of the land he would be compelled.

25,910. Then presuming in the opposite case that the rent should be raised would you compel the tenant to accept it?—Or give notice to quit.

25,911. So you would not place the two upon the same footing, so that the landlord could give the tenant notice to quit if he was disinclined to accept the rent?—Certainly not. I would give the owner of property less rope than I would give the tenant who has his living to make by the sweat of his brow.

25,912. (*Chairman.*) Did I understand you to say that the Court should have power to increase the rent, and that the tenant should be bound to remain there and pay the increased rent?—No, quite the contrary, that the court should be enabled to increase the rent if it thought that the value of the land was higher than the tenant was paying, but that the tenant should have the option of leaving the farm by giving notice to quit.

25,913. (*Mr. Dalton.*) Even if he had a 21 years' lease?—I perfectly understand that in case a Land Act of this kind were passed, existing agreements would have to be put an end to at some early date.

25,914. (*Chairman.*) Take the case, I will not say your own, but the case of a man who has, shortly before the Land Act was passed, entered into a lease for 21 years; you have given your opinion that within five years after the making of that lease, either tenant or landlord should be entitled to go into court, and to get the rent fixed?—Yes, I would not go beyond that.

25,915. In the event of its being reduced that would be binding against the landlord, but in the event of its being increased the question is whether the tenant should then be entitled to go notwithstanding his 21 years' lease?—After his five years.

25,916. Then it means this: that you would break all these leases?—I think after you have passed a Land Act giving a man fixity of tenure, a lease would be entirely inoperative and out of place.

25,917. But we are speaking of a lease existing at the time that the Land Act is passed. Can you give your opinion upon that point?—I thought I had answered that question.

25,918. I thought you had not given an opinion whether in such a case as that the tenant would be entitled to break the lease on the ground that he objected to his rent being raised?—My suggestion was that in case the Land Act was passed leases would be entirely put an end to.

25,919. Existing leases?—Existing leases. They would not be consistent with an Act for fixity of tenure.

Compensation for disturbance.

25,920. (*Mr. Lambert.*) Then I want to know what you would call fixity of tenure; presuming that a man took a farm of whatever size you like, even an allotment of an acre or ten acres, or up to any size, when he had got into possession of that, would you make it impossible for that landlord to get him out

Prof. J. Long.

28 June 1894.

without the consent of the Land Court?—I would, with the exceptions I have already named.

25,921. May we have those exceptions again?—The non-payment of rent, wilful waste, dilapidation or destruction of property, sub-letting without consent, bankruptcy, or assuming that the land was required by the landlord or his son to farm, or for the purpose of small holdings or the improvement of the estate.

25,922. Presuming that the landlord gave the tenant compensation for disturbing him, would you not then give the landlord the right to resume the occupation of the land?—By private arrangement between themselves.

25,923. I mean presuming that the landlord gave his tenant notice to quit, and he was prepared to give him, and it was the law that he should give him, compensation that would adequately remunerate him for the change that he would have to make in going to another farm, would you allow the landlord to do that?—I must answer that in this way, that I have not considered the point, and I should not like to give an answer upon it. That would involve making another exception, and I do not see how it would be consistent to do so at the moment without thinking it over.

25,924. Are you a tenant farmer yourself?—Yes.

The Agricultural Holdings Act.

25,925. (*Mr. Elton.*) I wish to ask you as to something you said about the Agricultural Holdings Act; I think you explained that the object of the Act was to compensate the tenant for his outlay, and not to compensate him for the value remaining, and so on?—No, I did not say that.

Compensation for improvements.

25,926. I think it was put to you by Mr. Channing?—I did not mean that.

25,927. They were very long questions, and I thought perhaps you might have missed some of the statements in them; but certainly it is down on the notes. We will put it right now. It was that the object of the Act was to secure the value of the tenant's outlay, and not the value remaining in the holding, and that that was not carried out. However, the question and answer will speak for themselves, but your opinion now is not to that effect?—Will you kindly put the question again?

25,928. Was the effect of your answer intended to be that the object of the Agricultural Holdings Act was to provide compensation representing the value of the improvement to the incoming tenant, or the amount of the outlay by the outgoing tenant?—The chief object of the Act is to provide for the payment to the tenant for improvements under the third schedule, or the third part, I forget which, for the unexhausted improvements.

25,929. The basis being the value to the incoming tenant, and not the expenditure of the outgoing tenant?—Of course the basis would be the value to the incoming tenant; it should be, but it is not exactly expressed so.

25,930. Then if your former answer appeared to be to the contrary of that, you do not mean that?—I have given no answer to the contrary.

25,931. You did not intend to do so, at any rate?—No.

25,932. Therefore you say that no particulars are given to the tenant by which he can judge of the basis on which the valuation is made?—I said in the cases which have come under my notice.

25,933. We will take it in that way, but as a matter of fact you said it universally?—No, I did not, indeed.

25,934. Now, will you tell me whether you intend to say that in valuations under the Agricultural Holdings Act they do not give separate headings and items under which compensation is assessed?—I can only give you the same answer, that in cases which have come under my notice, and my own is one, there have been no particulars given.

25,935. You know that the Act requires them?—The Act requires them.

Prof. J. Long.

28 June 1894.

25,936. You say it is not carried out in that respect?—It is not carried out in that respect.

25,937. In your experience?—It may be the fault of the tenants themselves. It might have been my fault.

25,938. So long as you limit it to what has come under your own experience I am quite content?—Quite so; I do.

Cheese making.

25,939. Would you, just for my private information, answer one question. I have followed with great interest what you said about the dairying industry. You said you could make some of these foreign cheeses in England?—Yes.

25,940. For instance, you mentioned Gorgonzola, I believe?—Yes.

25,941. Gorgonzola is a skim milk cheese, is it not?—No; it is made from new milk.

25,942. Is it made of the same milk as the Ticino milk; is it Lombardy milk?—Lombardy milk.

25,943. Is that not richer by far than what we get in this country?—No.

25,944. Is it not the richest in the world?—Not at all.

25,945. Do you think that the milk we get hold of in this country would make that same quality of cheese?—It would make any cheese that is known in this country.

Butter making.

25,946. You say there is no butter trade system here. Do you know of any place where there is, and where it is well carried out? Is there such a system in Normandy?—There is a system in Normandy, and a system in Denmark, and a system in Sweden.

25,947. Have you ever paid any attention to the Cork butter system?—The Cork trade I know very well.

25,948. Do you think that is a satisfactory system?—A fairly satisfactory system, but that is not English.

25,949. You would not recommend the Cork system being applied here?—I should not object to that. I prefer the Cork system to none, very much.

25,950. Do you know the Cork system?—Very well indeed.

25,951. How do they fix the price?—Valuers.

25,952. What valuers?—They are appointed in the market. I have seen the operation. The casks of butter are opened with a machine. The staves are all taken off. The expert puts the trier in, and grades it and fixes the price.

25,953. Is it not rather this, that they have a fictitious auction in the public room?—Practically.

25,954. At which prices are named which will clear the market?—Practically so.

25,955. The prices are not fixed by the valuers, but by the price which will clear the market on the bids given?—I should say, perhaps, to correct myself that the grade is fixed by the expert, and the price by the buyers.

25,956. By the what?—By the operators.

25,857. I beg your pardon, it is fixed by the trustees after going through the form of an auction?—That is really so in practice, but, of course, it is practically formed by the buyers themselves.

25,958. Speaking practically, is it not said that the trustees know the price before the whole operation?—It is said so.

25,959. I do not want to go into detail. I only say would you introduce the Cork butter trade system into this country?—I would not fix the price of butter as they do, but I would have a market like they have, and I would grade the butter as they do.

The witness withdrew.

Mr. Thomas Parton called and examined.

Mr. T. Parton.

28 June 1894.

25,960. (*Chairman.*) You are a tenant farmer at Weston Hall, near Crewe?—Yes.

Particulars of farm.

25,961. What sized farm have you in your occupation?—656 acres altogether. There are three farms.

25,962. How long have you been in possession?—On part of it 25 years.

25,963. Do you hold under a lease?—No, a yearly tenancy.

25,964. What is the rent you pay per acre?—About 30*s.*

25,965. Has that been reduced of late years?—No.

25,966. Has it been maintained?—Yes.

25,967. Has the rent generally been maintained in your district?—Yes.

The letting of farms.

25,968. Are there any farms out of occupation and unlet?—No.

25,969. When farms are untenanted can tenants be got for them?—Very easily.

25,970. Are there men with sufficient capital ready to take them?—Yes.

Effect of the depression.

25,971. What has been the effect of agricultural depression in your district?—The effect has been this, that people have lost money, therefore there is a diminution of capital.

25,972. That has not had the effect yet of reducing the rent?—No, it has not materially.

25,973. Have there been abatements of rent?—Temporarily, and remissions.

25,974. But no permanent reductions?—No.

25,975. Has your district suffered from the drought in the last year or no?—Certainly it has suffered.

25,976. Not very much?—Not to a very great extent, but it did suffer. Of course, the atmospheric influences would cause it to suffer.

25,977. Is your's a dairy farm?—Yes.

25,978. What town do you supply?—Crewe.

25,979. Has there been an increased cost of cultivation of late years?—Yes, in some respects there has.

Wages.

25,980. Have the agricultural labourers' wages been increased or no?—For the skilled labourers they have been increased.

25,981. But not the unskilled?—The ordinary labourers' wages have not increased.

25,982. Have the wages of ordinary labourers been maintained?—The skilled labourers' wages have.

25,983. I mean the ordinary, the common labourers; have their wages been kept up?—No, they have fallen.

25,984. How much have they fallen?—Very little; about 1 per cent.

25,985. Not more than 1 per cent?—No.

25,986. And the skilled labourers have had their wages increased?—Yes.

25,987. How much?—They have gone up 25 per cent.

25,988. As much as that?—Yes.

25,989. What do you call the skilled labourers?—The men of trust; the men that have an intelligent view of their work, and can go about it in an intelligent manner.

25,990. What proportion do they bear to the others?—I think there would be about 15 per cent. of them.

Rates.

25,991. Has there been an increase in the rates and taxes in your district?—Considerably.

25,992. Is your's a purely rural Union, or are there towns in it?—It is rural and urban.

25,993. What has been the increase of rates?—I should think 60 per cent.

25,994. Has that been due to the urban districts?—Yes.

25,995. What is the name of your Union?—Nantwich.

25,996. What has the increase been due to?—There are large public works at Crewe, and these men are often discharged at the age of 65. I daresay you gentlemen would have known that there was a great bother about the pension fund there: since that time many of these men did not accept it and they, I believe, were thrown on their own resources and discharged, and therefore they become chargeable to the Union, and for that reason the Union has to be enlarged, and therefore the officialism and everything connected with it has been increased accordingly.

25,997. Is the main increase due to the poor rate for indoor and outdoor maintenance?—That is one great thing, and the maintenance of the main roads is another very great increase—the county roads.

25,998. (*Mr. Lambert.*) If the main roads are maintained by the county they are not by the parishes, I presume?—They are parish and county too; there are district as well as county roads.

Tenants' capital.

25,999. (*Chairman.*) Do you think that farmers have less capital than they had?—Yes.

26,000. Is the condition of the farms somewhat deteriorated in your district?—Yes.

26,001. What is that due to?—It is due to want of capital.

Low prices.

26,002. Then what are the subjects of complaint mainly by the tenant farmers in your district?—The subject of great complaint is these low prices.

26,003. That is the main thing?—Yes.

26,004. Has the price of dairy produce fallen?—Yes.

26,005. How much has that fallen?—About 25 per cent.

26,006. As compared with when?—With the year 1880.

26,007. When did the prices begin to fall?—They began to fall between 1880 and 1885.

26,008. Have they been maintained since then?—They are lower now than were ever known.

26,009. What is that due to?—It is due to the foreign competition.

26,010. Does the foreign competition affect you in the dairy produce?—Yes.

26,011. In butter?—Chiefly, and in cheese.

26,012. Do you supply milk to Crewe?—Yes.

26,013. Has the price of milk been lowered?—To some extent.

26,014. How much?—About 10 per cent.

The Agricultural Holdings Act.

26,015. Have you to complain of the Agricultural Holdings Act?—To a certain extent.

26,016. What is your objection to it?—There are too many legal technicalities about it; it is so difficult to understand and so difficult to carry out.

26,017. What alterations do you suggest in it?—The Act requires simplifying in order that we may understand it more plainly and carry out its conditions more simply.

26,018. In what respect mainly?—There are so many technicalities in respect to the time of giving notice. The time is defined within certain limits and a fixed period, and unless farmers are pretty well cognizant of all these little intricate technicalities they are subject to forfeit their claim.

Scheduling the condition of farms.

26,019. What suggestions have you to make with regard to it?—I think, in the first place, that some record should be kept and scheduled of the holding when you enter upon it.

26,020. For comparison with the condition when the tenant leaves the farm?—Yes, and when the incoming tenant enters upon it, and this schedule form should not be in the possession of either the landlord or the tenant—it should be kept in some secure place under Government control.

26,021. That might do very well for future tenancies, in the case of future lettings; but in the case of existing tenancies what would you do where there is no such record?—You will have to be guided to a very great extent by the Act.

26,022. In the improvement of the Act what have you got to suggest with regard to the existing tenancies?—Supposing I was quitting a tenancy, and everything was in due form, I should expect that I should receive compensation for all unexhausted

Mr. T. Parton. 28 June 1890.

improvements; but supposing that some of these conditions have not been complied with, I should be liable to forfeit them.

26,023. I only want to gather what your view is as to the amendment of the Act as regards existing tenancies. You said as regards future tenancies there should be a record of the condition of the farm at the commencement of the letting?—Yes.

26,024. So that it may be compared with the condition of the farm at leaving?—Yes.

26,025. But that provision would not be applicable to existing tenancies, because there has been no record made when the farm was entered upon?—No; but supposing I was going to create any permanent improvement, of the first class improvements I think that it might now be scheduled in the same way that I am proposing with regard to the incoming tenant. The value should be arrived at by the landlord and tenant combined.

26,026. (*Mr. Chaplin.*) Before they are made, do you mean, or after they are made?—Before they are made. In the first instance I have got to apply to the landlord for consent to do it; after I have got the consent and the thing is done then I want it tabulated what the amount has been, and that this should not be left to me or to any other party, but it should be on this schedule, and that this schedule should not be the property of either landlord or tenant.

26,027. That it should be a permanent record for a future examination as to what the cost has been?—That is it, so that evidence could not be produced in the expensive way it is now.

Improvements.

26,028. (*Chairman.*) Do you consider that these improvements should be permitted without the consent of the landlord?—Not in all cases.

26,029. What exceptions would you make?—All the first class improvements should still be with the consent of the landlord.

Judicial rents.

26,030. Are you in favour of judicial rents, of referring the question of rent to an independent tribunal?—No.

26,031. Do you know what the opinion of tenants in your district is on that subject?—The opinion generally is that it should be a free contract between the two parties.

26,032. And that there should be no intermediary to determine it?—No.

26,033. Has the matter been discussed by them?—Yes.

26,034. You do not agree with Mr. Smith, who has given evidence from that part of the country, from Lancashire, rather in favour of judicial rents?—I am not acquainted with Mr. Smith. I have not heard his views.

26,035. (*Mr. Lambert.*) Do you know Mr. Smith, the Member of Parliament for the Garstang division of Lancashire?—If it is Mr. Smith the member for Garstang I have heard of him.

26,036. (*Chairman.*) Do you know what his views are on the subject of land tenure?—Not particularly.

26,037. Where did the discussion take place?—At the Chamber of Agriculture.

26,038. How many tenants are there belonging to the association?—How many members?

26,039. Yes?—About 120, I think.

26,040. They have discussed this matter of the judicial rents?—Yes.

26,041. And they came to the conclusion adverse to it?—Yes, it should be freedom of contract between existing parties.

26,042. Was there a division upon it?—I do not recollect.

26,043. Was there a minority in favour of it?—I am not prepared to give an exact answer to that.

26,044. What other recommendations have you got to make?—I think there wants a readjustment of local taxation.

26,045. On the subject of the law of distress, what have you to observe upon that?—I have very little to advance against it.

26,046. You do not think any change is necessary?—No.

26,047. Then with regard to railway rates?—I think there is a very great change necessary there; I think the preferential rates in favour of the foreigner are very injurious to local men.

Mr. T. Parton. 28 June 1890.

Railway rates.

26,048. Are there many small farms in your district?—Yes.

Small farms.

26,049. What is the smallest farm a man can make a living out of?—60 acres.

26,050. I presume he works himself?—Yes.

26,051. And his family too?—Yes.

26,052. Are the small farms rented higher than the large ones?—Not very much difference.

26,053. (*Mr. Lambert.*) What would be the rent of a 60 acre farm that a man could make his living out of?—The rent is generally about 30*s.* an acre in our district.

26,054. (*Chairman.*) Have the small farmers done better than the large ones of late years?—No, I think there is very little difference.

26,055. Not much difference?—No.

Labourers.

26,056. I suppose the labourers have done very well, inasmuch as the skilled labourers have their wages raised and the others very slightly reduced—they can get a great deal more for their money than they could?—The skilled labourers in our district are in a better condition than ever was known.

26,057. They would get a great deal more for their money?—Yes.

Wages.

26,058. (*Mr. Giffen.*) What wages do you pay the ordinary labourer now?—The best men are getting from 18*s.* to 20*s.* a week.

26,059. These are skilled people?—Yes.

26,060. But what do the ordinary people get?—We can get them from 12*s.* to 14*s.*

26,061. How much did you pay the ordinary labourer 10 years ago?—You paid the ordinary labourer about 12*s.*

26,062. Ten years ago?—Yes.

26,063. Then you still pay him about the same thing?—12*s.* to 14*s.*

26,064. And you paid about the same 10 years ago to the ordinary labourer?—You pay a little more now than you did 10 years ago.

26,065. I thought you said in your evidence-in-chief that the wages of the ordinary labourer had been a little reduced?—No, I think not. I think my answer was that they were increased about 10 per cent.

26,066. I wish to put it into actual statements of the amounts paid, and then we shall be able to make the per-centages ourselves. You say you pay 12*s.* to 14*s.* to the ordinary labourer?—Yes.

26,067. And you paid about the same 10 years ago, or not quite so much?—Not quite so much.

26,068. Not quite so much 10 years ago?—No.

26,069. Then the ordinary labourer gets a little more than he did 10 years ago?—Yes.

26,070. And the skilled labourer gets now from 18*s.* to 1*l.* a week. What did he get about 10 years ago?—About 15*s.*

26,071. So his wages have increased very much?—Yes.

Expenditure on buildings.

26,072. (*Mr. Clay.*) Regarding the schedule when asking for buildings, if the landlord was not inclined to give you these buildings, what would you do?—In some cases you have to pay interest on the outlay; that means increased rent. In other cases the landlords put these buildings on the premises as an assistance to the existing tenant.

26,073. If the tenant was to make these buildings, and they would not pay interest, they would not pay the tenant even?—He would not pay interest, certainly not.

26,074. If the tenant made these permanent buildings, if they were not worth the interest of the money to the farmer, what is the use of putting them there?—He would put them there for his own accommodation.

26,075. Would they be worth the interest of the money laid out on them? Would interest accrue from that extra accommodation to him?—Yes.

26,076. Are you sure of it?—Yes.

Mr. T. Parton. 28 June 1894.

26,077. Why would it not accrue to the landlord then?—The landlord would not get the direct benefit if he did not charge the interest to the existing tenant.

26,078. But if the landlord was building them, why should the tenant not pay the landlord interest upon them?—In many cases they do.

26,079. I thought you said not?—I think I said so, but in some cases they did not, because these buildings were erected as an assistance to the existing tenant.

26,080. Does the rent of a farm not depend partly upon the good buildings that the landlord has there on the farm when the tenant offers for the farm?—Yes, they have a very great influence upon it.

26,081. They create, do they not, a basis of rent?—Yes.

26,082. And that is the landlord's interest for the capital he has expended on the buildings?—Yes.

26,083. So thereby the tenant virtually pays interest upon the buildings. Do you grant that?—Yes, in most instances he does.

26,084. And if the tenant was wanting the landlord to build more buildings, would he be inclined then to pay interest upon them?—In some cases he would; in others he would not.

26,085. Therefore where no interest could be paid the buildings are not required if they cannot pay interest?—They are often required, but there is often not the forthcoming capital to erect.

26,086. You were asked about the said Mr. Smith; did you ever read the discussions that took place in the Chamber?—What Chamber are you referring to?

26,087. The Chamber that Mr. Smith discussed these matters at?—At Preston?

The three F's.

26,088. I was astonished to hear that a public man like Mr. Smith was discussing these matters, and a Cheshire farmer here never heard of them?—Not in my memory. I have heard of Mr. Smith discussing what he terms "the three F's" at Preston, but of course they did not particularly interest me, and I did not take particular cognizance of them.

26,089. And you did not read the discussions?—Not seriatim, I did not—not intelligently I did not read them.

26,090. (*Mr. Chaplin.*) How many years have you been upon your farm?—I am holding at the present time three farms; the farm that I am holding, in connexion with the other farms, I have been there all my life, and I may say that my predecessors have been there for about 200 years.

26,091. In fact, you are a really representative Cheshire farmer born and bred?—Yes.

26,092. Two hundred years you said your people had been there?—Yes.

26,093. Then, I presume we may suppose you have a tolerably wide acquaintance with Cheshire farming and Cheshire customs and Cheshire farmers?—Yes, pretty wide.

26,094. And although you have this wide acquaintance with Cheshire matters you have not taken any particular interest in the discussions raised by this Mr. William Smith?—No.

26,095. Do I gather your opinion to be this: that the opinions of Mr. William Smith, whatever they may be, are not very widely shared by Cheshire farmers as far as you know, and do not excite very great interest among Cheshire farmers?—They do not excite very much interest.

26,096. This is shown by the fact of the little attention that you have paid to it yourself?—Of course, they are not in harmony with my own feelings, that is the reason I have not.

26,097. As far as you can tell us would your views, generally speaking, upon this subject be shared by Cheshire farmers; and as to the opinion of your Chamber, do you think that you fairly represent that?—Well, from the discussions that have taken place in the Chamber, I know these discussions are not in favour of what they term "the three F's." I may say I am a member of the Council of the Chamber.

26,098. You are well conversant with the proceedings of the Chamber, and with the general view and opinions of that body?—Yes.

Mr. T. Parton. 28 June 1894.

26,099. You say that farmers in Cheshire have been losing money of late. Since what date would that observation apply to?—I should say from the date of 1887 and 1888.

26,100. What do you attribute this to chiefly?—I attribute it to the foreign competition.

26,101. That is, I suppose, to lower prices resulting from foreign competition?—That is it.

Price of cheese.

26,102. The lower prices of what articles chiefly are you referring to?—Cheese in particular. After cheese, beef and mutton and pork.

26,103. Is the cheese that you have to compete with of better quality than that which you produce in Cheshire?—We do not admit it.

26,104. But it is good, I suppose?—Yes.

26,105. Do you also sell butter?—Not to any great extent.

26,106. And milk?—Milk we do sell.

26,107. In milk, I suppose, you do not suffer from foreign competition?—No, except in this Swiss condensed milk.

26,108. Is there nothing to be done in the way of improving the manufacture of your cheese?—We have a Dairy Institute in our neighbourhood, that is very largely patronised, which has done a very good work in our district.

26,109. As far as you are a judge, is your cheese that you produce at home better than the foreign cheese that you have to compete with?—Yes.

26,110. Then how is it that the price of the better article is lowered?—Because there is so much foreign produce on the market that this naturally affects ours. There is too much cheese on the market.

26,111. Is it the case that even the prices of the very best cheeses are lowered in consequence?—Yes.

Demand for farms.

26,112. But in spite of all this I understand there are still plenty of applicants for farms whenever a farm is vacant?—Yes.

26,113. Then that looks as if farmers in Cheshire were still able to make a living in spite of the depression which you have had in the last few years?—But it is not a very remunerative living.

26,114. I suppose you would admit, yourself, that the depression in Cheshire is not so bad as in many other counties in England of which you have heard?—No, I think we suffered less in Cheshire than any other county.

The Agricultural Holdings Act.

26,115. Now, with regard to the Agricultural Holdings Act, I understand that you wish that that should be simplified, and chiefly with regard to the present system of giving notice; is that so?—No, I think that a 12 month's notice according to the Act is sufficient.

Claims and counter-claims.

26,116. I meant the notice that is now given for claims for compensation; did you not express some wish that the Act should be simplified in that respect?—Yes.

26,117. What is it that you have to propose?—That instead of two months, the tenant is obliged to give notice two months previous to the quitting of the tenancy.

26,118. That is the law now?—Yes.

26,119. What do you propose instead of that?—28 days.

26,120. That the tenant should give 28 days' notice?—Yes.

26,121. Have you anything to say with regard to the time at which the landlord should give notice?—I think it should be applicable both to landlord and tenant.

26,122. They should give notice at the same time?—Yes.

26,123. Do you attach importance to the fact that the landlord should not be able to give his notice after the tenant's has been given in?—Yes I do, in the first instance, but then supposing that there is any other claim he should have power to have an amended claim, that is, for damage done to buildings or anything of that character, I would say for 10 days after the termination of the tenancy.

26,124. Do you propose that the tenant should be able to give in an amended claim as well or not?—It will not be necessary, supposing that he makes an allowance

Mr. T. Parton.

28 June 1894.

for what he is going to consume during the existing period of 28 days.

26,125. There would be no necessity for any further notice on the part of the tenant?—No.

26,126. Then your view upon the subject is this, that the time of notice now provided for by the Act should be reduced from two months to 28 days?—Yes.

26,127. And that the landlord should have power, in addition, to make an amended claim in regard to deterioration of buildings afterwards?—Yes; for instance, suppose a man wilfully destroys any part of the holding.

Scheduling of improvements and Boards of Conciliation.

26,128. Are there any other respects in which you desire to see the Agricultural Holdings Act altered which you would like to put before the Commission?—I do not know that there are, except that these improvements should be tabulated; and then, supposing that any difference arose between landlord and tenant, I think that we want to elect a Board of Conciliation, and that this Board should be equally representative—that is, that somebody should elect an equal number of tenant farmers and landowners and, that these cases might be submitted to them for their determination.

26,129. You are now speaking of disputes that may possibly arise upon the question of compensation for improvements?—That is it.

26,130. Do you mean improvements such as those that you have spoken about in the first class, or all improvements?—Supposing that the first class improvements were scheduled then it would be an easy matter to determine their value, but if they were not scheduled, and if there were a want of evidence, and this evidence had to be produced, and it could not be agreed upon by the two parties, then these matters should be given to this Board of Conciliation.

26,131. Now I think I understand what you mean, that where improvements of the first class have been scheduled, and a record made of them in the way that you propose, then you are of opinion that there would be no necessity for a Board of Conciliation?—I don't think, where there is a mutual good feeling between landlord and tenant, there is any need of a third party even in this case.

26,132. But in cases where unhappily that mutual good feeling does not always exist, then you are in favour of a Board of Conciliation for certain purposes?—For certain purposes.

26,133. Those purposes, I understand, being for the valuation of first class improvements which have been made without this system of being scheduled?—Yes, everything that a tenant is entitled to compensation for.

26,134. Everything?—Everything.

26,135. The Board of Conciliation then would be for the purpose of valuing all the improvements for which he is entitled to receive compensation?—Yes, which could not be mutually agreed between the existing parties.

26,136. That Board of Conciliation is to consist partly of landlords' representatives, and partly of tenants' representatives?—That is it.

26,137. How do you propose they should be elected?—I think the best body to elect them is the Chamber of Agriculture.

26,138. Of their county?—Of their county.

26,139. How would you get it in a county where there is no Chamber of Agriculture?—I would refer it then, I think, to the County Council.

26,140. As to the method of election, have you anything to propose, or is that a part of the question which you have not thought out?—I have not distinctly thought it out.

26,141. Do you find the disputes with regard to compensation are common in Cheshire?—They are not very common; but still there are cases where such a Board would be an immense advantage.

66,142. Both with regard to the settlement of disputes and also for the purpose of doing full justice to the tenant?—Yes.

Value of land.

26,143. (*Mr. Dalton.*) Has the capital value of land in your county fallen?—It is estimated that it has only depreciated about 5 per cent.

26,144. The capital value?—Yes.

26,145. Have there been any sales of land lately in your county?—Not of farms.

Mr. T. Parton.

28 June 1894.

26,146. What has been your own experience as regards profit and loss; speaking generally, have you lost of late years?—Yes, I have.

Results of farming.

26,147. To any great extent?—If you take into consideration any interest for the capital, I have lost to a very great extent.

Rates.

26,148. Your rates, I think you say, have increased very much?—Considerably.

26,149. Have you got the figures as to the rates you pay now for your farm, and the rates you paid in previous years?—The rates I paid about 10 or 12 years ago would be about 16*d.* in the £.

26,150. That is very light?—Yes, two 8*d.* rates.

26,151. Was that the whole of the rates?—That was the whole of the poor rate and highway rate.

26,152. And those were the only rates you paid then?—Yes.

26,153. What do they come to now?—About 2*s.* 4*d.* generally.

26,154. That is an increase of 10*d.*, what does that amount to on your rateable value?—That would be, as I said, about half as much again.

26,155. What is your rateable value; what are you assessed at on your farm?—At about 28*s.* an acre.

26,156. 28*s.* an acre on 656 acres?—Yes.

26,157. (*Mr. Lambert.*) Have you a balance sheet of your own farm?—Yes.

Results of farming.

26,158. Have you been making a profit of late years?—No.

26,159. I suppose you are paying rent at this time?—Yes.

26,160. Can you give me any reason why you are not making a profit?—Because of the sales of the produce being very much less.

26,161. I suppose that if you paid less rent you would be able to make a profit?—I do not see that it is a matter of rent; it is a matter of the price of the produce.

26,162. Therefore, if the produce still continued to decrease in value, say, went down another 25 per cent., would you still think it your duty to pay the same rent?—No; I should expect some practical sympathy from my landlord.

26,163. Now that it has gone down 25 per cent. you do not expect any practical sympathy?—We get it.

26,164. Have you got it?—Yes.

26,165. You have had a reduction of rent?—Yes, a remission; not permanently.

26,166. But still it is not remission enough to enable you to make any profit; you are still losing money?—To a certain extent.

26,167. You are losing money?—Yes.

26,168. And yet you farm according to the best system?—I think so.

26,169. You said just now you had never heard of Mr. Smith, and the measure which he has proposed for the relief of tenant farmers?—I think I qualified that.

The three F's.

26,170. You are not in favour of the three F.'s?—No.

26,171. Do you know what they are?—Yes.

26,172. Would you mind giving them to me?—Fixity of tenure, freedom of cultivation, and free sale.

26,173. Fair rents, I think, is included in it?—I do not think that is in; I do not know.

26,174. I think fair rents, fixity of tenure, and free sale are the three F's. You say they do not particularly interest you; but does not a fair rent particularly interest you?—Certainly it would interest me; but when I go to make an agreement with my landlord, if I know that I have really the practical sympathy of my landlord, I have no other cause to complain.

26,175. But you have not practical sympathy enough now to enable you to make a profit?—Yes, but we keep hoping for better things, which do not come.

Fair rents.

26,176. Then, presuming those things do not come, you will expect some practical sympathy?—Yes.

26,177. But in the meantime you are losing money?—Virtually I am, but not to any great extent.

Mr. T. Parton.
28 June 1894.

26,178. You are not losing money to any great extent?—No.

26,179. But you would not lose money if you did not pay so much rent?—It is not so much a matter of rent as it is of the sale of the produce that we raise from the land.

26,180. But if you did not pay any rent at all you would make money then?—I should make money to the extent perhaps that I did not pay any rent.

26,181. Does not your rent more than cover your losses?—I say that I am not losing to any extent.

26,182. I say your rent more than covers your losses?—Yes.

26,183. Therefore you are interested somewhat in having a fair rent?—Yes.

Security of tenure.

26,184. Are you not interested in having security of tenure; that is, that you should not be turned out of your farm at a moment's notice?—Speaking personally, I am not afraid of it.

26,185. For what reason?—Because of existing circumstances, as I have explained.

26,186. Would you mind just explaining them to me again?—Because, as it were, there is a feudal feeling existing between landlord and tenant to a very great extent.

26,187. But you attach considerable value to security of tenure?—Yes, certainly I do.

26,188. You think it is of great value to the farmer?—Certainly.

26,189. Therefore it would interest farmers, as a rule, that they should have security of tenure?—Certainly.

Boards of Conciliation.

26,190. You advocated a Board of Conciliation for certain purposes; that is, for purposes of estimating compensation?—That is it.

26,191. And you would not be in favour of its going further, to estimate other matters of difference between landlord and tenant?—In respect of rent, do you mean?

26,192. And possibly in allowing the tenant to make improvements upon the holding?—As I said, the first class improvements would be included in what I have advocated.

Rent and value of produce.

26,193. At any rate, dairy produce has fallen 25 per cent., and the capital value of land, or the rent, has only decreased about 5 per cent.?—That is the estimated price.

26,194. Can you give me any reason why rent has not depreciated to the same degree as agricultural produce has depreciated?—No; the simple reason is that there are more people wanting farms than there are farms to be let.

26,195. And that tends to keep up rents?—That is it.

26,196. (*Mr. Channing.*) Do we understand that you come here in any sense as a representative of the Cheshire Chamber of Agriculture?—No.

26,197. You attended, I understand, the meetings at which the recommendations as to the changes in the Agricultural Holdings Act were discussed?—Yes.

26,198. Have you considered the recommendations made by the Central Chamber of Agriculture?—Yes.

26,199. Do you generally approve of them?—Some we approve of, and some we do not approve of.

26,200. In reply to Mr. Chaplin you stated your approval of the recommendation as to the notice, that it should be given 28 days before by both sides?—Yes.

26,201. Is there any other recommendation which you specially approve of; if you have not considered it, I will not press that point?—I do not know that I have.

Boards of Conciliation.

26,202. Do we understand that this Board of Conciliation is to be on any fixed numbers, or what is your idea and the idea of others in connection with it?—Of course, it rests with the people to elect them, but I should think 12 men, with an elected umpire or referee.

26,203. You contemplate something like the Board of Conciliation, which has been sitting in various strikes, and things of that kind?—Yes.

26,204. That is, so many on each side?—Yes.

Mr. T. Parton.
28 June 1894.

26,205. Not a court composed of a county court judge and two assessors chosen by two sides, or anything of that kind?—No.

26,206. (*Mr. Lambert.*) How would you pay all these men?—They would be like any other public officer. I do not think they would expect much pay.

26,207. You expect to get these men to do the work for nothing?—To a certain extent. All these officers are honorary in our district.

26,208. (*Mr. Channing.*) I do not quite understand what you say about the first class improvements, and the relation of this Board of Conciliation to them. Do you mean that if a tenant wishes to have a first class improvement carried out by the landlord, and the landlord refuses, that that would be one of the matters which you would refer to this Board of Conciliation to consider whether it would be suitable to the holding?—The thing would not exist if he did not give his consent. I have to obtain the consent of my landlord in order that this permanent improvement in the first class may exist. I could not agitate on a thing that did not exist.

26,209. I mean, if you applied to your landlord to erect a certain building for the use of your farm, and he declined to do so, is that one of the questions that you would refer to a Board of Conciliation if it was a necessary building for the work of your farm?—I have not considered it in that light.

Price of cheese.

26,210. You said that the prices of foreign cheeses, I understood, were kept up, and that the home cheeses did not sell so well?—I think you misunderstood me.

26,211. Have you gone into the question of comparing the foreign imitations with the Cheshire cheese and the testing of the two?—It is very evident that the foreign cheese is of very much better quality than it used to be, and if we had not applied ourselves intelligently to making a better class we should have been beaten altogether.

26,212. Is this better class of cheese being made by a few men like yourself, or is it being organized among a large number of farmers in Cheshire?—It is being organized by a large number in Cheshire, inasmuch as we instituted before the County Council this Dairy Institute for the better teaching of the art of cheese making.

26,213. And that is improving the position in Cheshire?—Yes.

26,214. (*Captain Owen Thomas.*) When did you begin to feel the depression in Cheshire?—I should say it would be some time about the year 1878 or 1880.

26,215. What would you say has been the reduction in the prices of farm produce in your district, as compared with the times when you commenced to feel the depression?—Do you want the percentage or do you want the real prices? If I were to give you the real prices it is this: we used to sell our cheese at from 60*s.* to 75*s.* per hundredweight, now we have to sell it at from 45*s.* to 60*s.*

26,216. (*Sir Nigel Kingscote.*) How long ago did you get the highest price for it?—I think that would be about 1874 or 1875—somewhere in the seventies.

Sizes of farms.

26,217. (*Captain Owen Thomas.*) Are you a tenant on a small or large estate?—On a large estate.

26,218. What is the average size of the farms in your district?—About 200 acres.

26,219. And on that estate, I suppose, about the same?—There are many smaller farms on this one estate.

Average rent.

26,220. I think you said the average rent is 30*s.* an acre?—Somewhere about that.

26,221. Is that on that estate or does that include the whole neighbourhood?—It is a little higher on estates where superior accommodation has been given in the way of buildings and homestead.

Reduction of rent.

26,222. Did you apply for the remissions which have been granted to you?—We asked for it.

26,223. In a body, or did you go yourself individually?—We approached the agent.

26,224. Did you ask for more than 25 per cent.?—No, we never dictated at all, but tried to explain our circumstances.

26,225. Were you satisfied when he promised you 25 per cent.?—We have not got 25 per cent.

Mr. T. Parton. 23 June 1894.

26,226. I thought you said you had?—No.

26,227. What have you had?—We have had, I should say, on an average about 10 per cent.

26,228. What should you say has been the reduction in the price of farm produce? I come to the question again as a matter of per cent. How much per cent. less now do you receive than you did in 1878?—It would be 25 per cent.

26,229. Would you say that the farmers in Cheshire are satisfied with the rents that they are paying now?—I cannot say that they are.

26,230. Are there any means by which they can be satisfied as things are at present; can they approach their agent or the landlord and arrange it in that way?—In many instances they can, but as I said, it is not a matter of rent only, we want to see that this foreign produce is put on the market in a different way to what it is to-day.

Low prices.

26,231. Would you say it was a blessing or a calamity that produce—bread, wheat, cheese, and all that sort of thing—is sold at such a low price?—It is no blessing to the farmers.

26,232. But what about the other people, the consumers?—They do not receive the same amount of employment that they did, through the low price of this produce, because the farmers have not the money to spend.

Mr. T. Parton. 23 June 1894.

26,233. But foreign produce is imported and is sold above cost price; you cannot say that it is sold below the cost of production?—In some cases it is.

The Board of Agriculture.

26,234. (*Mr. Elton.*) Do you think that the difficulties in the Agricultural Holdings Act which you have spoken of, that is to say, the difficulties of comprehending it, could be explained to the farmers by the Board of Agriculture; do you think that the Board of Agriculture in this country should do what I believe they would do in America, issue to the farmers small explanatory tracts or explanations of the Agricultural Holdings Act?—That would be a very good thing.

26,235. It is the business of an agricultural department, at least in many countries, to circulate information to the farmers to make them understand difficulties?—That is very much required in our district.

26,236. And in particular about the way to make an easy use of the Agricultural Holdings Act?—Yes.

26,237. Do you think that would be a practicable thing for them to do at once?—Very.

The witness withdrew.

Mr. W. Bell.

Mr. William Bell called and examined.

Mr. W. Bell.

26,238. (*Sir Nigel Kingscote.*) I believe you are a tenant farmer in Forfarshire?—Yes.

26,239. How long have you been a tenant farmer?—Twenty-two years.

Particulars of farms.

26,240. You hold three farms, I believe?—Yes.

26,241. On different properties?—Yes, from two different properties.

26,242. Are they all arable, or are they grass?—We have grass in rotation, but it is all arable land.

26,243. It is all what you would call arable land?—Yes.

26,244. How many acres?—About 720, I think.

26,245. May we know the rental?—Fully 1,000*l.*

System of cultivation.

26,246. You said just now that you treated some of it as grass; have you altered the system of cultivation lately?—I do it at any time; I have full liberty of cropping, and I can either leave it in grass or take it up as I like. I have full liberty with all my land, but this is not the general rule.

26,247. Have you laid any down to permanent grass?—None permanent. I take it up from one to five years, as I want it.

26,248. Have you altered the system of cultivation on account of decreased prices of agriculture, or for what reason?—Just on account of the lessened prices.

26,249. So that you may keep more stock upon it?—Yes.

26,250. And grow less corn?—Less corn, and less green crop—less potatoes for instance; we used to grow a good many of them.

26,251. Therefore you carry a much larger stock upon your farm of either cattle or sheep, or both, than you formerly did?—Exactly.

26,252. Are you also employed in agricultural valuations and arbitrations?—Yes.

26,253. You are employed as a valuer?—Yes.

26,254. I suppose that has made you acquainted with a large district of country?—Yes.

26,255. May we say all Scotland?—No, I should not say through all Scotland, but Forfarshire, Fifeshire, Kincardineshire, and Perthshire.

Effect of the depression.

26,256. Will you tell us what have been the effects of agricultural depression; have all classes suffered, or who has suffered most or least?—Landlords and tenants.

26,257. They have suffered as much as any, you mean?—The landlords and tenants have suffered, but the labourers have not suffered any in our country.

26,258. Have the large tenants felt as much difficulty in meeting their rents as the small ones?—I suppose much about the same.

26,259. Would you say that the small tenant is worse off than the labourer?—Practically I should say he was. He may pay the rent, or exist on the place, but it is only by his family's industry.

26,260. And probably his family being able to work with him?—Yes, that is so, whereas they would earn more wages working for some other person, or at some other occupation.

Wages.

26,261. Have the labourers' wages increased with you?—Very much.

26,262. Can you tell us at all what percentage; take 12 years ago or 15?—We only employ a few of the labourers by the week; they are mostly employed by the year or half year. When I began, the weekly labourers I had at 13*s.* a week, now I pay 18*s.*; they are up 5*s.*

26,263. That would be 30 or 40 per cent.?—Yes, the yearly men are up about 1*s.* a day—about 15*l.* a year.

26,264. Are those men employed upon the same number of acres that they used to be?—I do not think so.

26,265. Are they better housed than they used to be?—A great deal better.

26,266. Would you consider an agricultural labourer in your district to be as well off as artisans in towns?—Far better.

Land laid down to grass.

26,267. Is there any land that has gone out of cultivation in your district?—Not out of cultivation; it has been laid down to grass, but there has been nothing left to waste.

26,268. That which has been laid down to grass, has it been laid down with care and attention, so as to become permanent pasture, or merely just laid down to graze a few sheep or cattle?—Of course it depends upon the kind of land it is, but I do not know that very much land with us has been laid down, as I have seen it laid down in the south.

26,269. That would have been an inferior sort of land?—Yes, pretty high-lying land.

26,270. Has the best land suffered like that?—No, it is still cropped.

Condition of cultivation.

26,271. Do you think, speaking generally of the district, that the land is as well farmed as formerly?—I do not think it is quite as well farmed as formerly, taken all over.

26,272. There is not so much money laid out in manures?—On a great deal of the best land there is quite as much, but whenever you come to the inferior land, where it will not pay for cultivation, there is a great deal less.

26,273. In fact I suppose everything has been done latterly to try and reduce expenses?—Certainly.

Mr. W. Bell.

28 June 1894.

Changes of tenancy.

26,274. Do you think there are more changes of tenancy now than there were?—I do not think so; landlords in our country take less rents, and of course when a man is brought up to farming he is not much use for anything else, and if he can get a living he sticks to it.

26,275. Rents have been very much reduced, have they not?—Very much.

Change in cultivation.

26,276. I think you said that there has been a great change in the mode of carrying on the cultivation of the farms, there has been an alteration in the rotation of crops?—Yes, and there will be still more, I think, presently. We are just on the eve of greater alterations in Scotland, I think; the price that wheat and potatoes have come to will alter things immensely.

26,277. Therefore you think that that will tend in a great measure to displace the labour, and to make it less?—It must do so.

26,278. Is that the reason that you have individually given up growing so many potatoes, on account of the labour?—Not on account of the labour, but on account of the price I get for them. I feel no trouble about the labour, but I feel the trouble to get plenty for the crop when I grow it.

Effect of depression.

26,279. Do you think that the depression has shown itself at all in the management of the estates, and the keeping up of the landlords' houses, and the amenities of the house?—Certainly.

26,280. I suppose you attribute that to the diminished rent roll?—Certainly.

26,281. And it also has tended to prevent landlords laying out any more money than they possibly can help?—They try to do that; they lay out as little as possible, because there is no certainty of a return.

26,282. But they have been laying out money?—Yes, they had to do it.

26,283. In keeping up buildings?—Yes.

26,284. The tenants do that mostly, I believe?—No, the Scotch tenants do not do it so much, the landlords do most of the buildings in Scotland.

Rural depopulation.

26,285. Do you think that the change which is going on is likely to affect the population?—I should think the rural population will decrease.

26,286. It will have a very great effect upon the agricultural labourer really?—Certainly; it will upon everybody.

26,287. What do you say are the causes of the depression?—The low prices of course are the cause.

Foreign competition.

26,288. How are they brought about, by foreign competition or what?—Foreign competition.

26,289. You told us that that is shown very much in wheat and potatoes?—Certainly. I may say that off one farm I have sent about 170 tons of potatoes to America this year, because I could not find a market at home, and I paid the American Government fully 300*l.* duty. I grow about 45 acres of wheat on that same farm, and I used to count upon getting 2*l.* a quarter for it, and I am only getting 1*l.* just now. That is how it affects me.

The season, 1893.

26,290. Do you think that you suffered as much in Scotland last year as the English farmers did, owing to the season?—Not so much as the English farmers did, certainly not, we were not burnt up. We had a fair enough crop if we could have got money for it, but we had to sell wheat at 1*l.* a quarter, and potatoes at 30*s.* a ton, and there is no money in the trade.

26,291. But then also, I suppose, you have more feeding stuffs to give animals, and therefore you would have liked to have been able to have had more store cattle, or to have had them cheaper?—Certainly I would like to get them cheaper—as a feeder I would like to have them cheaper.

Importation of Canadian cattle.

26,292. Would you like to see more Canadian cattle coming in again?—Certainly, I would like to see free trade in everything. They send us the beef finished, and I think we should like to compete with them in getting Canadian cattle, or any sort of cattle.

26,293. Would you chance their bringing disease with them?—I should never trouble myself about it; I have had it before.

26,294. Have you had disease upon your farm?—Yes, several times.

26,295. And do not mind it?—You cannot mind it. It is the same as a loss in anything else. We have been more troubled and more loss has been caused by shutting out Canadian cattle than ever we had by disease.

Mr. W. Bell.

5 June 1894.

26,296. Then you would chance the disease if you could get Canadian cattle?—Certainly, or the Holstein cattle that we used to get long ago. The Holstein are the best cattle we ever got—far better than any Canadians.

26,297. (*Mr. Chaplin.*) Would you do that even if you were confident it would bring disease?—I do not see that it brings back disease any more than our own.

26,298. I did not ask you that; if evidence was shown to you that it would be the means of bringing back disease, that is to say, that those countries are not free from disease; would you then take the risk of it?—Yes, I should take the risk with the experience I have had myself for 22 years, and having known the trade all that time. I should take the risk at once.

26,299. (*Sir Nigel Kingscote.*) Have you no experience of store cattle coming from the south of England, or any part of England to the Scotch markets?—I have; I have had a lot of them last year, coming from the county of Kent, and from Shropshire.

26,300. You did not like them as well as the Canadians?—Certainly not; they came too thin; they were not very good.

Rates.

26,301. Then as regards the taxes on land, do you find them heavier than they were?—I do not think there is a great deal of difference in our quarter.

26,302. Not?—Not a great deal.

26,303. You have no wish to express as to that?—Not a great deal. On one of my farms I pay a high poor rate because I am near a manufacturing town—within four miles of it, and I pay there perhaps twice or three times as much as my neighbour over the fence, and I get no benefit for that, but unless they increase the areas (the assessment is all by parishes in Scotland), unless they put us into a union, or something of that sort, I do not see how they can make any change for the better.

26,304. Then you express the opinion that the rating area of agricultural land ought to be entirely distinct from town's land?—Yes, and I should have the rate put upon means and substance. Any man in business can make 500*l.* a year and get off by paying 1*l.* in poor rates, and a tenant farmer who can make very little has to pay 20*l.* or 30*l.*

Condition of cultivation.

26,305. Do you think that, taking your district generally, there is a diminished production?—I do not think so, not a great deal.

26,306. Do you think that the land has suffered from insufficient capital?—I do not think there is any difference in that to what there was. In the good land there are always people willing to take the farm. If a man is not competent he must go out and make place for some other body. That is the only thing in Scotland apparently—they do not stick there if they are not competent.

Tenure.

26,307. As regards the Agricultural Holdings Act do you think there is much complaint about the present system of tenure?—It is a sort of dead letter in Forfarshire. There is too much formality and expense about it.

26,308. In what way would you like to see it altered?—To get it simplified.

26,309. Do you think that it is not very understandable?—It is quite understandable enough, but it needs too much of the lawyer about it to get through with it quickly enough, and he takes too much of the profit and the farmer gets nothing.

26,310. Do you think it tells against the tenant and is more in favour of the landlord?—No, I do not think so; I think it is against both of them. I think it only goes to the lawyer. The landlord has to pay and the lawyer pockets the money, and the tenant gets nothing. That is about the general thing.

26,311. Some of it goes into the pocket of the lawyer?—A good deal.

26,312. Have you any idea as to what you would like to see changed in it?—Simplify it and make it like any ordinary claim.

Restrictions.

26,313. Would you like to see the restrictions removed from the leases?—Not a great deal. There are a lot of

Mr. W. Bell. 28 June 1894.

petty restrictions that might be with advantage put off altogether. They are not perhaps of much consequence as they are not very much acted upon, but it would be as well if they were left out.

26,314. You do not think that the effect of the Agricultural Holdings Act has in any way increased the depression in agriculture?—I do not think the Agricultural Holdings Act has had anything to do with increasing the depression.

Railway rates.

26,315. As regards railway rates, have you anything to say about them?—Yes; there is a great outcry in our days in favour of everything which helps to simplify matters to bring the producer and the consumer together, but instead of that the railway rates have turned the other way. In our quarter they carry at special rates under a ton or two tons, and then four tons, and then large quantities. Whenever you get a large quantity of course it is a good deal cheaper, and then the small producer cannot live. It tends to throw everything into the hands of the middleman; he has to buy the whole grain in the neighbourhood.

26,316. From your knowledge of it do you think that the foreign goods are carried at a lower rate than the home produce?—Yes.

26,317. Although the home produce may be carried a shorter distance it pays more than the foreign does on a long through rate?—They bring wheat for instance to Liverpool—they rail it from Liverpool at a very small rate, but if we want to move it 15 miles in our country we pay as much as they will get it pretty well across the whole country for. Everything is sacrificed now-a-days for through trains and through rates, and everything of that sort. There is no effort made to develop the country at all.

State loans.

26,318. Do you think that the want of capital among both landlords and tenants might be met by State loans in any way?—Of course it is always a good thing to get cheap money, but I do not think that that would make a great deal of difference either.

Co-operation.

26,319. As regards co-operation in the manufacture and distribution of agricultural products, have you seen it tried anywhere with any good effects from it?—I have seen none in our country.

26,320. What do you think about it?—I think nothing of it at all. I think everything is far better left to individual effort. I think the only specimen we have got in our country is a creamery. It was started as likely to be a great benefit to the clay land in the neighbourhood of the Carse of Gowrie, and it got the name of Carse of Gowrie Dairy Company; it was to distribute milk cheaper and to do everything to make things better: but the only thing it has done has been to lose a lot of the money of the shareholders.

26,321. You do not think it will answer?—It has not answered.

26,322. As a matter of fact it has not?—No, I do not think so.

Land Courts.

26,323. As regards the position of landlord and tenant, would you wish to see any third party come between them for the purpose of fixing rents?—No.

26,324. Would you wish to see a land court?—No.

26,325. You think the tenant farmer is quite able to make his own contract or bargain with the landlord?—He should be.

26,326. And you have no wish to see a third party step in between them?—No, I have not.

26,327. (*Mr. Clay.*) I think you have been largely employed as a valuer?—Yes; for 10 years.

Valuations.

26,328. Is that for valuing land?—Valuing land and agricultural valuations, all descriptions of them.

26,329. Railway lands as well?—Yes.

26,330. In valuing railway land what amount of value do you put on above the real rental; how much increased per cent. for forced occupation?—Land taken for railways is generally valued at 30 years' purchase plus 50 per cent. for forced sales, that is 45 years' purchase in Scotland.

26,331-2. Have you been employed in valuing under the Agricultural Holdings Act?—Yes, both by landlord and tenant.

26,333. Have you any rate that you go on for manures and cakes and feeding stuffs?—I may say that in Forfarshire there has very seldom been a case that has been very much disputed, except one or two. In most of them it is a sort of private agreement, and very often it has been referred to one arbiter.

Mr. W. Bell. 28 June 1894.

26,334. What is your rate of valuation for the different classes of substantial manures in the shape of bones and bone meal?—I could not give it to you off-hand exactly, but I could give you a note of it perfectly well.

26,335. Could you supply to the Commission the general rate that you settle these questions upon in Forfarshire and other districts round about you, as an appendix to your evidence?—Certainly.

26,336. Could you supply the Commission with the rates on cakes as well?—Certainly.

26,337. And the value that you put upon these unexhausted articles that are left in the farm?—Yes. (*See Appendix.*)

26,338. You have said that the large and small tenants have suffered alike?—Yes.

Small farms.

26,339. The small tenant having his family working round about him has not been better able to stand the strain of severe times compared with the large tenant?—If he has got his family with him they have to live out of it. We have a good many small tenants in my neighbourhood, and they have a greater difficulty than the large tenants in getting along.

26,340. Have the families stuck to them as they used to do under the Scottish system?—As soon as they are grown up they go to the towns to service and to the factories.

26,341. So the young families now do not work upon the farm as they used to do?—No.

26,342. That has altered their position considerably?—Very much.

Export of potatoes.

26,343. Regarding the price of potatoes, you say you have been sending potatoes largely to America; have you found that profitable?—Yes.

26,344. What have you been realising per ton after paying the duty?—This year.

26,345. Yes, and last year?—This year I got up to 46*s.* or 47*s.* per ton; that is the most I got.

26,346. Was that clear gain after paying duty?—After paying everything.

26,347. What is the duty a ton on potatoes in America?—It is very nearly 2*l.* a ton, 37*s.* or 38*s.*

Importation of Canadian cattle.

26,348. You talked about the introduction of foreign cattle and said that you would rather have them and face the disease than be without them?—Certainly.

26,349. Do you not think if that were to bring lung disease or rinderpest or any of those things it would be a very serious thing for you?—We had it before and we made more money at that time than we make now. That is the only thing I am speaking of.

26,350. Was the money made from cattle alone, or was it not made from the general increase of prices all round?—Taking the cattle themselves we made more money.

26,351. I think cattle were 10*s.* and 11*s.* a stone then?—Yes.

26,352. What is the price now?—It would be about 20*s.* a cwt. cheaper than it was since 1882.

26,353. Did not the higher prices all round then lead to the money-making in cattle you are talking about?—They did to a certain extent.

26,354. If the importation of cattle brings in disease wholesale, as we had rinderpest in 1863 and 1864, and if we introduce lung disease from America, would it not be a very serious matter for the home-breeder of store cattle?—I think if we introduce so much as we do from America of meat and other things and stop the importation of live cattle, the cure is worse than the disease.

26,355. Are you not arguing this question from a purely personal feeder's view and not from a breeder's view?—Most distinctly. I am not a breeder of cattle at all; I am a feeder of them. Our land is not so much adapted to breeding in Forfarshire.

26,356. How would a farmer who breeds regard that view of yours?—The breeder, I suppose, wants everything kept out—I should imagine so.

26,357. But if the importation were to bring in disease, what effect would it have upon the general breeders of cattle?—Of course if they got disease it would be the same with them as with the feeders, they would lose money; that is the only thing.

Mr. W. Bell. 28 June 1894.

26,358. Would the breeder not lose more in proportion all over the country than the benefit you would get from supplying a few feeders in Forfarshire and Aberdeenshire and other parts; and would he not be at a greater disadvantage in having disease brought by the cattle that you have to feed?—I have fed a great many Canadian cattle and never saw pleuro in them at all. I once purchased a lot of cattle, and one of them after newly coming from the ship took ill. The local authority ordered ten cattle (out of 100) to be kulled. Nothing was found wrong, except the first beast, and the remaining 90 were kept on and fed. Every one remained healthy. They said it was pleuro, but since then I have had the same thing twice. It is when we get them out of the ship over-heated and put them to the fields and they get a bad night that they appear like that.

26,359. Do you believe that the pleuro comes from natural causes or do you say it comes from the overheating?—It was no pleuro.

26,360. You do not believe in pleuro?—I do not believe that that was pleuro.

26,361. Do you believe in pleuro at all?—Yes, most certainly I believe in pleuro, and I have had it.

26,362. Is it contagious?—I do not know what you call contagious, but if you have one beast in a lot and it breaks down with it, you may look out in another 10 days for another. That is the only thing I know about it; whether you call that contagious or not I cannot tell.

26,363. On the whole, for a feeder you would not object to have these cattle brought in?—I have yet to learn that we got it from them. It was never amongst these Canadians, it was always amongst the Irish cattle I had it.

26,364. I go back to the starting-point, how would the admission affect the general breeders, those who rear cattle for the general public?—We all work for the general public, the feeder as well as the breeder.

26,365. Is the breeder not of more consequence than the feeder?—I do not know. I imagine they are both needed for the benefit of the country. If everybody was a breeder we should have to do as people are doing just now, take the American beef and breed cattle for our own use only. *Mr. W. Bell* 28 June 1894

26,366. But if there were more breeding and less feeding would not the one meet the supply and demand better?—I do not think so. At the present time they have got big training grounds for troops at Barry, and even the Government are not patriotic. They are supplying the men there I understand with American killed beef.

26,367. Do they have American beef for the British soldier?—Yes.

Rates.

26,368. Then regarding poor rates, I think you said at one part within the radius of the burgh that you would pay an extra rate?—I am four miles from the burgh, but half of the burgh is in the same parish as my farm.

26,369. Do you not receive equal advantage from the burgh?—I receive no advantage from the burgh; I am four miles from it, it is no benefit to me at all.

26,370. No benefit in buying your produce and saving your carriage?—None. I put it on at a station within a mile and a half of my farm, and very little of what I produce is consumed in the burgh.

26,371. You would know that when you took your farm?—Certainly. I am speaking of it as a general piece of policy.

26,372. Where would you improve the rating? Would you put it upon personal property?—Yes.

26,373. You used the expression—I do not know if the English people know much about it—"means and substance"?—Yes.

26,374. You mean by that, personal property?—Certainly. If a man is earning 500*l.* a year he should pay on 500*l.* a year. They assess the income tax in that way.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Forty-ninth Day.

Friday, 29th June, 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

The Right Hon. Baron Rendel.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Charles Isaac Elton, Esq., Q.C.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Charles Whitehead, Esq., F.L.S.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, *Assistant Secretary.*

Mr. William Bell recalled and further examined.

Mr. W. Bell. 29 June 1894.

Importation of Canadian cattle.

26,375. (*Mr. Clay.*) I elicited some opinions from you yesterday regarding a very important question, which is the admission of Canadian cattle into the country. You seemed to say you had no fear of disease; indeed you went the length of saying that you would take all risks?—Certainly I would.

26,376. I put the question to you: how does that affect the English and Scottish breeder of grazing cattle and feeding cattle?—I suppose it first affects him in the same way as every other importation affects his neighbour; he first has to take his chance; it would tend to cheapen cattle, there is no doubt of that.

Mr. W. Bell. 29 June 1894

26,377. Take the chance of disease you mean?—No, I am no more afraid of any foreign cattle than of our own. I have found more disease in my Irish cattle than ever I found in any other class of cattle.

26,378. Do you know of the importation of foot-and-mouth disease from the Continent, you grant that do you?—I do not know where it come from, but we had it. I have had it myself amongst my stock three times

26,379. Do you know whether it was traced to foreign importations from Germany, and some of those places?—I suppose it is the same as with the human race;

Mr. W. Bell.
29 June 1894.

wherever there is cattle there must be disease. I do not believe in ever stamping it out.

26,380. Do you not agree that it is a very serious matter when one comes across breeding cattle?—It is a serious case I think in any class of cattle. It is one of the risks of the trade.

26,381. Do you think the general community, the beef and mutton eaters of this great country, would not be seriously damaged in having disease imported into their flocks and herds?—I do not think so; we get plenty of foreign beef as it is, and they would just get the more. That would be the whole of the matter. There is plenty of foreign cattle brought dead to this country, and if we had a short supply here we would only get more. That is the only way I can see out of it.

26,382. Would it not meet the question if these cattle instead of coming here to be fed were slaughtered at the ports or sent in in the dead state as they are just now, and so keep them out for fear of the spread of disease?—In Scotland, if we are feeders instead of breeders, what does it matter for the country?

26,383. I put it to you, if every farmer was breeding 30 per cent. more and feeding, say, 30 per cent. less, would the supply of the lean stock for grazing and feeding not meet the supply and demand better than it does just now?—I do not think so.

26,384. You state that in Forfarshire you are a non-breeding country?—Most of it.

26,385. Would it not be as profitable to breed a part?—I have done it, and I tired of it. I found it did not pay me.

26,386. What pay have you been generally getting for these Canadian cattle that you have been feeding?—It depended on the class you bought.

26,387. Have you been sufficiently paid, better than by home cattle?—Yes.

26,388. You made a remark that you were better paid with Irish?—That was a mistake I think, I have been better paid by Canadian cattle.

26,389. How much per head have you received off Canadian cattle for feeding?—I have had 1*l.* a month; I have had 2*l.* a month; I have had 50*s.* a month. It just depended whether you bought them for short keep or long keep.

26,390 How long have you to keep these cattle until you make them into what you call good Scotch beef for the London market?—Some of them only a month, some of them three months, some of them six, and I have kept them 12 months.

26,391. And then sold them as good Scotch beef?—I do not know what they are sold for; they first go to the market; we sell them for what they are—we sell them for nothing else.

26,392. Do they sell at the same price as Aberdeens?—If they are small-boned neat cattle they do; if they are big strong cattle they do not.

26,393. Still you would rather have free trade in receiving cattle, what you would call free trade in disease, the same as anything else?—Certainly.

26,394. That is your opinion?—That is my opinion.

The Agricultural Holdings Act.

26,395. Regarding the Agricultural Holdings Act, would you say that it is good as far as it goes, but it could be made more workable and rendered more simple in application?—Yes.

26,396. What suggestions have you on that point?—I say there is too much of the law about the whole affair. At every step you are met with difficulty; if you do not give notice on a certain day, and if you do not do this and do not do the next thing, you are altogether thrown of course. I do not think that should be.

26,397. What remedy would you propose, to simplify the working of the Act?—Just make it a simple claim like anything else.

Claims and counter-claims.

26,398. Regarding the giving in of claims, would you look upon it favourably that these landlords' and tenants' claims should be given at the same time?—I should think so. I do not see why one man should have a preference over another—neither landlord nor the tenant. There is no use for it.

26,399. The present law in Scotland is that the claim of tenants must be given in four months before the end of the tenancy?—Yes, that is so.

26,400. In England it is two?—Yes.

Mr. W. Bell.
29 June 1894.

26,401. You think both these preferences to the landlord should be equalised and be put on one footing?—Certainly; I see nothing to take it out of the ordinary run.

Official referees.

26,402. Then regarding the compensation given for feeding stuffs, increased fertility, bones or good manures, would you have that left for one man—a referee or an overman as we call him in Scotland—to discharge that duty instead of so many?—There is no use for three.

26,403. You would rather agree that we should have one man set aside or two or three men in each county either appointed by the sheriff or sanctioned by the Board of Agriculture here, to become what you call experts in sitting down to dispense justice towards landlord or tenant, and thereby cheapening the process of procedure?—I think so. I think it would be far better.

Land laid down to grass.

26,404. I think there is one blot in the Act, I do not know whether you have the same opinion; that it does not give the tenant any allowance for increased fertility in laying down the land to grass?—I think that is the greatest mistake as far as we are concerned in Scotland.

26,405. So whoever dispenses justice in that Act you would give them sound ground to go upon, to give allowance for that increased fertility by laying down to old grass?—Certainly.

26,406. You think the Agricultural Holdings Act would be very workable if you dispense with lawyers and dispensed with the expensive procedure under the Act?—I see no difficulty about it.

26,407. The principle itself is good enough?—The principle itself is good enough.

26,408. But the working is bad?—That is just the only thing.

Co-operation.

26,409. You made a remark about co-operation; you did not, I think, look favourably upon it?—In our neighbourhood it has never done well.

26,410. Have you had any experience of it?—Very little. There has been very little; but what has been, has been a sort of failure.

26,411. Do you know that society from Edinburgh, the Farmers' Supply Association?—I think I can buy anything that I require cheaper than they can sell it to me. I do not know if it is right—I have seen their lists very often although I am not a member.

26,412. You are speaking from an individual point of view. Are all men in the same position as you, and knowing the trade as well?—I do not know about that. If they think it is better, I think they are quite entitled to go to a thing of that kind, but I do not think that those associations will affect agriculture very much.

26,413. In a co-operative sale, has that not been a benefit to men who are not so well qualified to judge of price as you are?—I am not prepared to say. My experience as far as that goes in the matter is not sufficient to entitle me to speak.

26,414. That Society has been so far prosperous?—I believe so.

26,415. And has met a great want of people that do not know the trade so well as you in the continual daily work of the buying of these manures?—Exactly.

Demand for farms.

26,416. (*Chairman.*) Are there any farms unlet in your district?—Very few; everyone could be let if it was wanted.

26,417. When farms are to be let are there applicants for them?—Yes, plenty for the most of them, if good farms. If there is a bad farm sometimes it is difficult to get it let, but practically it is not very much.

26,418. Practically there is no difficulty?—Not in Scotland.

26,419. Are there men with sufficient capital ready to go in?—There is not so much capital in that country as there used to be.

26,420. Are there men with sufficient capital?—They must just take them as they get them now.

26,421. What has been the reduction of rents?—I should say 35 per cent.—30 per cent. at any rate.

Wages.

26,422. Have the wages of labourers been maintained?—Very well; they have increased.

Mr. W. Bell. 29 June 1894.

26,423. Has there been much alteration in the cultivation of the district?—It is always varying.

26,424. Is there any dairying?—There is not much dairying in Forfarshire.

26,425. Has there been any substantial change?—There is more land laid down to grass than there used to be in the higher lands.

26,426. But in the lower districts?—There is not so very much yet.

26,427. About the same?—Yes, about the same.

26,428. Then the result is that the landlords have got less rent, and the farmers have got rather less profit?—That is so.

26,429. And the labourers have got more wages?—A good deal.

26,430. Then it would seem that the result in your district is that the labourers have got a larger share in the produce of the land than they did formerly?—No doubt about that.

Repairs, etc.

26,431. (*Mr. Gilmour.*) Yesterday Sir Nigel Kingscote asked you about tenants doing repairs in Scotland, and I do not quite think you caught his meaning. You said that they did not do repairs in Scotland?—I understood his question to be about erecting buildings.

26,432. I thought you had mistaken that. Do tenants undertake to keep the buildings and fences in repair when they take their lease and to leave them so?—That is so in many cases.

The letting of farms

26,433. We have been told by a good many witnesses here that the system we have in Scotland of advertising farms tends to bring about undue competition for them. Is that your opinion?—The competition would be there at any rate. I do not think it does.

26,434. Do you see any other practical way of getting farms let, and of putting them before the public?—If I was a landlord I should certainly advertise them myself if I wanted to let. I should never think of anything else. We think nothing about that.

Freedom of cropping.

26,435. If freedom of cropping was granted, would that alter the mode of cultivation to any extent in the counties you know best?—Not to such a great extent as people imagine. It would in certain cases, but not to such a great extent as people talk about. It would very soon rectify itself.

Leases.

26,436. Is there a tendency in the farms that are being let in the country now to go back to the 19 years' lease without breaks?—In some cases there is; I should much prefer a 19 years' lease myself.

26,437. Can you say it is rather pointing at present that men are preferring to go upon a 19 years' lease?—You get one man to take for 19 years, and another man says "I will take a break;" it is about equally divided. If there is a good farm, and a man thinks he is getting a fair bargain, he is quite willing to go in for 19 years; he rather prefers 19 years; he has some security then.

26,438. Would you go the length of giving a tenant going in for a 19 years' lease freedom of cropping as long as he left the farm in a certain rotation which you desired at the end of the 19 years?—I have that, myself; I am only restricted for the last two years of my lease.

Mr. W. Bell. 29 June 1894.

26,439. Do you think that that would, as a rule, keep up the fertility of the soil?—I do not know; I should not like to say so.

26,440. It depends on the man?—Exactly.

The scheduling of farms.

26,441. It has been proposed by witnesses that an inventory of the state of all the different fields on a holding should be taken when a man enters, and used at the expiry of the lease; would that be practically of any use at the end of a 19 years' lease with us?—Death would intervene, and you would not have the same man to look at then, and I do not think a written document would be much use to look at. I do not think that is a very practical thing.

Importation of Canadian cattle.

26,442. (*Mr. Chaplin.*) Upon the question of Canadian cattle you have expressed some very strong opinions; I understand you to be of the opinion that rather than that the Canadian cattle should not be allowed free admission into the country, you would be quite prepared and willing, in preference, to run the risk of re-importing disease; is that so?—I should take the ordinary risks of the trade.

26,443. You would?—Yes.

26,444. The ordinary risks of the trade?—Yes.

26,445. You are aware that immense sums of money have been spent within the last few years by the Government for the purpose of eradicating that disease, and that that object now has been practically if not actually accomplished; but still you would be content to see all the results of that expenditure thrown away, provided you could get a return of the free admission of Canadian cattle?—I should like free trade in cattle as in everything else. We cannot carry on as farmers under present circumstances.

26,446. Even if the result of admitting Canadian cattle without slaughter at the port was to bring back pleuro-pneumonia disease, you think that that result, and the fact that all the money spent by Government had been thrown away, was a less evil than keeping the Canadian cattle out?—I think so.

Judicial rents.

26,447. (*Chairman.*) Is there any demand in your district on the part of the tenants for judicial rents?—None.

26,448. Has the matter been discussed among the tenant farmers?—We have very few meetings in Forfarshire, but I know the opinion of a great many, and I meet a great many of them every day. I never heard it expressed; there is no wish for anything of the sort in our country, as far as ever I am aware.

Leases.

26,449. Is your lease for 19 years the general rule?—They used to be the universal rule; now they are 19 years with a mutual break at 7 and 14 years, that is the way they put them. It is virtually a lease for 7 years, but they are always put in the old way, 19 years.

26,450. Seven or 14 years; does that bind the landlord for the full 19 years?—It binds them both only for the seven years. Either of them can give notice at the end of seven years, but if he does not do so at the first seven years he has to wait another seven.

26,451. You have not observed any demand on the part of other tenants for judicial rents?—Certainly not.

The witness withdrew.

PROFESSOR HERBERT SOMERTON FOXWELL recalled and further examined.

(For previous evidence *see* page 331.)

Prof. H. S. Foxwell.

Effect of a change in the rates on the gold prices of commodities.

26,452. (*Mr. Giffen.*) You have answered the question which I put to you in the paper which you have given at much greater length than I anticipated, and I think you have given information upon points which were not in my question (*see* Question 24,357) but I gather, as regards the point which I put to you, you are of opinion that the value of gold measured by commodities will fall after this change in the ratio?—Yes.

26,453. That the value of silver measured by commodities will either not increase or will increase very slightly?—Will increase slightly.

26,454. And that the change then is to be in gold?—I think mainly.

26,455. The effect of that will be practically that you contemplate a fall in the value of gold not only measured by silver but measured by commodities amounting to, perhaps, 40 per cent.?—I beg your pardon—a fall in gold of 40 per cent.

26,456. That is what you contemplate after this change?—No.

26,457. How much then?—It would depend on the point at which the ratio was fixed.

26,458. But you are proposing the ratio of 20 to 1?—Yes.

26,459. Would that not be the effect if you have a ratio like 20 to one, and the present ratio is 33 to 1?—I do not think so. I should expect a comparatively small rise; a gradual rise of general prices.

26,460. Is that answer not a little different from what you have been saying here?—I think not.

26,261. But how much?—40 per cent. would be a catastrophic rise.

Prof. H. S. Foxwell.

29 June 1894.

26,462. You do not propose, I see, an immediate change to 20 to 1?—No, a gradual change.

26,463. But when the whole change is made that would be the effect necessarily—it is a mere question of calculation?—What would be the effect?

26,464. That the value of gold, measured by commodities would fall to the same extent as the value of gold measured by silver, that is to say, about 40 per cent. or 40 to 50 per cent.?—I do not admit that—no, certainly not.

26,465. How much would it be then?—It is almost impossible to say how much it would be because it would depend upon the total increase of the supply of money.

26,466. But if silver, which is to be one of the kinds of money after the change, is not to increase its value, then gold must fall in value?—Yes, I think I see your point.

26,467. It is a mere matter of arithmetic?—You must draw a distinction, I think, between the value of silver in Europe and the Indian silver valuation. I was speaking of the Indian silver valuation remaining comparatively stationary. There would, no doubt, be an alteration in the purchasing power of silver in London.

26,468. In what way?—The ounce of silver would have a higher gold value.

26,469. In what form and to what extent?—I cannot give you the exact quantitative measure. It is impossible to give the quantitative measure.

26,470. Then is the value of silver in London going to change in a different way from the value of silver measured in Calcutta?—The value of silver in London will alter very much more than the general scale of silver prices in India.

26,471. You will have one change of prices on this side of the world?—Yes.

26,472. And another change of prices on the other side of the world?—I have explained that as far as the commodities that were in active exchange between the two countries were concerned you could only have one scale of prices, but you might have a different scale of prices as regards ryots' wages, for example, and as regards house rent in India, and many matters of that kind, which, of course, might vary just as they vary between Switzerland and England.

26,473. Then the impression that I formed from the paper that silver would not change in value in London is not a correct one?—If you have formed that impression I should say that it is not a correct one.

26,474. Then, in point of fact, you affirm now that silver is going to rise in value in London?—Silver would rise in value in proportion to the rise of the ratio, subject to this, that gold would have fallen to some extent.

26,475. But which is it to be?—I have tried to explain that both effects would take place. I do not think anyone can possibly say to what extent. I would rather put it this way. However far the gold valuation would move, and however far the silver valuation would move, there would be an approximation between them. My own impression is that the gold valuation would move rather more and the silver valuation rather less, but I cannot say to what points they would move.

26,476. Let us take it that the gold valuation moves not perhaps 40 per cent. but 25 per cent., or 30 per cent. I wish to have some idea of the degree in which gold and silver have to change relatively to commodities when they change relatively to each other?—In London?

26,477. In London necessarily?—I should think it very probable that general prices might rise 10 per cent.—possibly even more, possibly 15 per cent.—by the time we arrive at the ultimate fixed ratio starting from the present very low point.

26,478. Then that would mean that silver relatively to commodities would rise a great deal in London?—I have not calculated out the exact effect.

26,479. But that was the one question that I put to you?—Pardon me, I think not—was it?

26,480. That was the question which I put to you?—You put a very complicated question which involved twenty points.

26,481. It seems to me the simplest question of all, and a mere question of arithmetic, and I wish to put it as such, that if the value of gold and silver relatively to each other change, then there must be a corresponding change in one or the other with reference to commodities. If you take the ratio of 33 to 1, and the movement is to be to 20 to 1, it would be an increase of more than 50 per cent. in the gold value of silver?—You say that would be the increase per cent?

26,482-3. That is the difference between the two ratios; it is about 50 per cent., and the question is, how much of that movement would be in silver. Would that movement with reference to commodities take place in silver or would it take place in gold?—I should think 15 per cent. of it might take place in general prices and the remainder in silver.

26,484. So that silver would go up about 35 per cent.?—Yes.

26,485. In London?—In London.

26,486. That would be the sort of market price of silver throughout the world generally; and it would have more command over commodities in the London market, which is the central market?—Over the wholesale markets, yes.

26,487. Would that stimulate the production of silver?—I have said that it would stimulate the production of silver.

26,488. Would not an increase of its purchasing power by something like 35 per cent. stimulate the production enormously?—Not necessarily.

26,489. Can you name any other commodity in which a rise in its value like that would not probably increase its purchasing power?—I think it would be simpler to stick to the instance of silver, because we have the case from 1809 to 1830, in which the value of silver increased a great deal more than that, more than 100 per cent., and yet the production, if I remember right, rather fell off over that period.

26,490. That is in certain given circumstances an increase in the value of silver did not lead to an increase of production?—That is so.

26,491. But that would not alter the general fact, that the tendency of an increase in the purchasing power of an article would be to bring about a larger production?—I have admitted that.

26,492. You would admit that?—I have admitted that in this paper.

26,493. Then that increase of the production of silver again might bring about its fall later on, might it not, and that would be a great disturbance of the silver market again?—I have also pointed out, I think, that if the production of either or both of the precious metals were to increase, there would be a rise in general prices and therefore a fall in the value of the metals, and therefore to that extent there would be a tendency to check the increased production of the metal.

Effect of a diminution of the purchasing power of gold.

26,494. Assume, hypothetically, for the moment that the change is not in silver but in gold, that is to say that the whole change is in gold and that the purchasing power of gold diminishes by about 40 per cent. or something like that?—Yes.

26,495. Do you think that the production of gold would remain the same after such an enormous diminution in its purchasing power?—I should think it would tend to fall off undoubtedly on general considerations; but, again, it is extremely doubtful on the grounds I have stated.

26,496. Then the consumption of it in the arts and for all purposes would probably tend to increase?—Yes, it would tend to increase.

26,497. So that it would be a very great change altogether that would be made?—Yes, it would be a considerable change.

26,498. What would be the change in reference to the wages of labour?—The first effect on the wages of labour would be a distinct increase on the ground of the revival of trade, the increased prosperity; the increased demand for labour would undoubtedly bring about a great rise in nominal wages.

26,499. Unless wages went up 40 per cent. the labourer would be worse off after the rise of prices than he is now?—But you are assuming a position which I have not granted, namely, that the whole change would be in gold.

26,500. I am speaking hypothetically at present, and assuming the change to be in gold?—Yes; if you assume the change to be in gold.

Prof. H. S. Foxwell.

29 June 1894.

26,501. But you do not think the change will be in gold?—No.

26,502. Do you think the change is going to be in silver more?—No, I think it will be divided between the two, and I do not think you have a right to assume anything else.

Effect of a change in the rates on the gold and silver prices of commodities.

26,503. If you divide the 40 per cent. between the two, you will get a change of 25 to 30 per cent. in the one, which is a very great change?—But you have been assuming throughout this argument that the percentage of change in the level of prices would be exactly the same as the percentage of change in the ratio.

26,504. The change must be in one or the other when you put things together which are at a certain value now; if you put them together at a different value, then one or the other must change with reference to commodities?—The total change would be proportioned to the total value of the metals after the alteration in the ratio. Now you increase the valuation of silver by 50 per cent. say; that applies, of course, only to the silver which is used as a commodity, and not to the silver circulating now at its full value, at the 15½ to 1. But you do not increase the value of the gold at all, you rather diminish the value of the gold. Therefore, on the average the total change in prices would be nothing like so great as you are assuming. You see a large part of the silver now existing is rated at 15½ to 1. As regards that mass of silver we do not increase its value in the least by raising the ratio to 20 to 1; on the contrary, if the old valuation of 15½ to 1 were abandoned, and this silver were written down to what would then be the international ratio of 20 to 1 you would, to a certain extent, diminish the value of that stock of silver, and to that extent you would tend to bring down general prices.

26,505. You cannot carry it any further?—Yes, if you like; in what direction?

26,506. I do not know that I quite follow you myself now?—I will put it in this way to make it simpler; the level of general prices will depend upon the stocks of metal upon which that valuation rests. The stock of gold would probably be rather less after the change, for the reasons that you have mentioned, namely, that the production of gold would be slightly checked by the rise in prices, and the fall in the value of the metal. As regards the stock of silver no doubt we should write up a good deal of it. That part of the stock of silver which is at present merely merchandise at a market value would be written up from 33 to 1 to 20 to 1; but that part of the stock of silver which is actually in circulation at anything like the value of 15½ to 1 or 16 to 1, would be written down, absolutely written down, by our change. So that upon the whole we should not write up the whole stock of the precious metals to the extent of 30, 40, or 50 per cent.; I should think probably not to the extent of 25 per cent., or 20 per cent.

26,506*a*. But still, the commodity silver would have greater purchasing power than what it has now?—Yes; silver in the market.

26,507. And the commodity gold would have less purchasing power than it has now?—Yes, it would have less purchasing power.

26,508. But you cannot give us any distinct idea of what the degree of change would be?—No.

26,509. Nothing more than what you have told us?—I am only protesting against the assumption that the degree of change would necessarily be measured by the degree of alteration in the ratio between the metals.

26,510. It must be, as a matter of arithmetic?—I do not see that.

26,511. You cannot carry it any further?—No. I should deny distinctly that it must be as a matter of arithmetic. According to me the valuation rests simply upon the proportion between the quantity of metals and the quantity of commodities.

26,512. Silver and gold have a certain ratio to each other now?—Yes.

26,513. And they have a certain ratio to other commodities?—Yes.

26,514. If you change the ratio as between themselves, then the ratio between the gold and silver and other commodities must also change in the same proportion, one or the other?—Yes, but not necessarily the valuations.

Prof. H. S. Foxwell.

29 June 1894.

26,515. I do not quite know what you mean; it must take the form of a change in the prices somewhere?—Yes, but the scale of prices in France, for instance, is resting very largely upon silver at the old valuation of 15½ to 1; silver in the market as a commodity will rise, but not necessarily silver prices in countries where the prices are not based upon the value of silver in the market, but upon the value (if you like to call it so, the artificial value) of gold to silver

26,516. Gold prices must fall then?—Gold prices, I have said, would rise.

26,517. Gold prices would rise, but the gold valuation would fall?—The gold valuation would fall to some extent, and the silver valuation would rise to some extent, but not necessarily to the full extent represented by the difference of ratio.

26,518. Take it that the value of gold is to be brought down 20 per cent., which you think is a probable thing—about 15 per cent., or 20 per cent. I think, with the figures that you gave—take it that that is going to happen?—I included in that the effects of the general speculative activity which would follow.

The intention of bimetallism.

26,519. Take it that that is going to happen in this country; you propose by legislation to give to every man who is entitled to receive an ounce of gold equal to so many ounces of silver—you propose to give him in payment of his debt less than what he has got now, that is the intention?—I am very much interested in hearing that suggestion made, because the contention of bimetallists has been all along that it is not enough to guarantee to a man that he shall receive his ounce of gold, but that what we ought to guarantee to him is stability of value in gold, as far as you can, so that he shall receive the same amount of commodities. But then, we have been told that that is not the case. During the last 20 years his ounce of gold, that is, the ounce of gold which the debtor has to pay, has increased in value 50 per cent., and we have been told that that is a thing which, as a matter of course, must be accepted. Now, you rather suggest that the value of the ounce of gold is not to alter, but is to be kept stable.

26,520. I am not suggesting anything of that sort at all. I am suggesting that you are going to do a thing by legislation, but what has happened of late years has not happened certainly through any legislation in this country, the Government has not meddled with the matter at all?—Looking at the matter historically and as calmly and deliberately as I can, I should be inclined to say that no country was really in so great a degree answerable for the change in the policy of Europe which led to the demonetisation of silver as this country.

26,521. Still, that is a very different thing indeed, from the Government of this country making a change within its own power which it has not done yet?—I quoted only the other day the Treasury letter to the Government of the Emperor, in which our Government refused to enter into any negotiations with the French Government on the question of uniformity of coinage until the French Government had adopted monometallism. That was very strong.

26,522. That was not a change which the Government made in its legislation here in any shape or form?—No, but it is admitted, I think, on all hands, that any change in legislation anywhere must affect the valuations of the world; the thing is necessarily international. If you demonetise silver anywhere you affect prices everywhere.

26,523. No doubt these things are international, but what the Government is responsible for is its own legislation surely. Has there been any change in the legislation of the United Kingdom with reference to the standard?—Not that I am aware of.

26,524. What you propose now is a change in the legislation of the United Kingdom which is to diminish the amount of gold which people are entitled to receive, or rather the amount of the debt which the people are entitled to receive, and you propose to do that by legislation—to diminish the value of the standard, that is really your object?—I should not like to have it put in that way. What I propose to do is to prevent a modification of the standard which has been going on for 20 years from further continuing and to some extent to make a small act of restitution to those who have been injured by that modification of the standard.

26,525. The immediate effect, then, is to change the value of the standard by your own legislation?—Yes,

Prof. H. S. Foxwell.
29 June 1894.

but I wish to say that I make no difference—I can draw no distinction—between a change in the standard which is brought about by the *laches* of the Government through abstention—apathy if you like—and one which is brought about by their active interference. In both cases the change is within their power.

Effect of a difference between the mint rates and the market rates.

26,526. Suppose as a matter of fact that the legislation to bring about this ratio is established, and as you say that the people who are entitled to an ounce of gold now, which gives them 33 ounces of silver, are in future to receive at the option of the debtor 20 ounces of silver, but the real ratio between gold and silver—the market ratio—remains as 1 in 33; that would be a most inequitable thing, would it not?—I did not follow that question quite; you make a change and yet the market ratio remains the same do you say?

26,527. I am assuming that although legislation fixed the ratio of 20 to 1, the market ratio—assume this for hypothesis sake—continues to be 33 to 1, which I believe myself to be quite likely; then of course that would be a most unjust thing to the creditor?—I could not admit that. In the first place you are assuming that the absolute standard of value is silver, and that if a man does not get the same amount of silver he is in some way defrauded; that seems to me a very great assumption to begin with.

26,528. At present the absolute standard is gold?—Yes.

26,529. A man receiving a debt receives an ounce of gold which commands 33 ounces of silver?—Yes.

26,530. You pass a law to say that the debtor at his option may give him for that debt not 33 ounces of silver but 20?—Yes.

26,531. Then I put the further question: Suppose the market ratio continues to be 33 to 1, and does not become 20 to 1, then you are making a great reduction from the sum of money which that creditor is entitled to receive?—No doubt in that case if you suppose that there will be a difference between the Mint ratio and the market ratio.

26,532. That would be pure confiscation, you will admit, if that should happen?—Even if that should happen there will be the further question whether the silver had not altered in its real value, because I do not admit that silver is to be the ultimate standard by which you measure the value of the standard money.

26,533. Assuming that silver does not change?—That it represents the same amount of commodities in fact?

26,534. I would hardly put it that way; but assume it your own way, or any way you please?—I should say that the proper measure of the standard is its purchasing power in commodities. I should not think of measuring it in silver; the real test is the commodities.

26,535. Unless silver should have risen in value to the extent to which silver has not risen in value, the debt which the creditor is entitled to claim would be diminished by your legislation?—Certainly.

26,536. That would amount to confiscation?—But of course our position all through has been that silver would rise in value.

26,537. To whatever extent the things do not change as you anticipate they will—suppose that your anticipations, like many others in economic matters, should not be confirmed by the event—to whatever extent your anticipations are not confirmed by the event, what you propose is confiscation?—I should rather put it in this way, that if we do not succeed in establishing our system these consequences which you mention would follow.

26,538. Then if you pass the law and the market does not follow you these consequences would follow?—Yes.

26,539. And if any large number of people are apprehensive that the market would not follow you, and they were to act upon that conviction, when you passed your law they would probably elect to go for their payment in the standard as it actually existed, and so bring about the panic which I have described before?—No. I have been unable to follow that argument altogether. I can see no reason why they should. It is contrary to precedent, and to the experience we have of the past, and it appears to me not to be explicable by any *a priori* suggestions which have been made.

26,540. Is it not the case that whenever you propose to give a man less than he is entitled to, or when he thinks that if he waits he will not get payment for his debt, he presses for payment at once; is that not the universal experience of mankind?—No, I think not. I will give you an example: The thing has occurred a hundred times in history. We have a turn in trade, for example, and people say prices are going to rise for the next five years, everyone believes that; it has been believed again and again—and the event has justified the belief—but there has been no panic, there has been no rush to obtain money, because the money cannot be better used in other ways, and there has been no withdrawal of money from the banks.

Prof. H. S. Foxwell.
29 June 1894.

26,541. Is that quite the same thing?—I think so; it is a diminution in the purchasing power of gold in that case exactly as it would be in this case.

26,542. But still is not an immediate diminution going to be affected at a particular date by a special change in the law?—Nor do I for a moment believe this would be. We should take the greatest possible precaution, and every precaution to prevent any immediate change.

26,543. You speak of a gradual transition?—Yes.

Transition from monometallism to bimetallism.

26,544. Can you describe what the steps would be?—Yes.

26,544*a*. And over what length of period the transition would exist?—There are many present who could give a better estimate than I could as to about the time that would be required to bring about an international conference upon a business-like basis; but I should put that in itself at something like two years. Probably two years would elapse before a conference met, the members of which would be empowered to do business seriously in this direction.

26,545. So that before anything could be done for depressed agriculture we should have to wait two years according to your idea?—No, because as these negociations were going on, and as every day it became more and more probable that such a conference would be summoned, the price of silver would gradually rise unquestionably, as it rose in anticipation of the Sherman Act before the passing of that Act.

26,546. The price of silver did rise in anticipation of the Sherman Act?—Yes.

26,547. But that was an Act for the purchase of silver?—Yes.

26,548. And not for bimetallism?—This would be an Act for the unlimited purchase of silver by all the mints of Europe; the Sherman Act was an Act for the limited purchase of silver by one mint.

Operations of the mint.

26,549. That brings you back to the old opinion?—Yes, I must rely on that.

26,550. That the mints buy, which is a matter of dispute?—Yes.

26,551. You still adhere to the opinion, then, that what happens at the Mint is that the Mint buys the metal?—I do.

26,552. And gives something else in exchange for it; that is the essence of what they do?—I think I put it in these words—what the Mint does is to give you legal tender in exchange for bullion, and that legal tender is essentially different to bullion.

26,553. I suppose you would admit that that is not the sort of definition of what happens at the Mint, which you will find in Adam Smith and other great authorities?—No, I do not admit that; but I do not remember Adam Smith defining this.

26,554. What happens at the Mint is undoubtedly, is it not, that the Mint puts a stamp upon the metal to certify its weight and fineness?—Yes.

26,555. And according to Adam Smith, and other great authorities like him, that is really all that the Mint does in substance, is that not so?—No.

Law of legal tender.

26,556. What else does it do?—A very different thing, certainly. It puts that particular metal,—that particular commodity,—under the law of legal tender.

26,557. But is the law of legal tender anything more than an enactment by the Government that whoever makes a contract is to fulfil it?—Yes. I said in my evidence on the last occasion, I think, that what you are now quoting would come under the Common Law of England. Every man who makes a contract under the Common Law is bound to keep that contract, but the law of legal tender is a very different thing; it is a

Prof. H. S. Foxwell.

29 June 1894.

statement that any contracts made in terms of money and not otherwise limited, shall be payable in money of a certain kind prescribed by the Act of legal tender.

26,558. That is to say, it is a particular kind of the law of specific performance, if I may use that phrase in the presence of Mr. Elton?—Yes.

26,559. Is it anything more than that?—I cannot say exactly what the relative position of Statute Law and Common Law is. I should not like to say.

26,560. Is it really anything more than an enactment that a contract when made shall be fulfilled?—Yes, it appears to me to be very much more than that, because it is for the Government from time to time to say in what way the contract shall be fulfilled.

26,561. Then, I suppose, you do not agree with Sir Robert Peel's famous definition of a pound?—I agree generally with what he meant there.

26,562. Sir Robert defined the pound sterling of English money to be so many grains of gold, did he not?—Yes. But do you imagine, then, that in so defining the pound sterling he was excluding the use of Bank of England notes as legal tender money; because at that very time, when he was speaking, the whole object of his speech was the regulation of the issue of these legal tender notes.

26,563. Yes, but it is quite possible that the legal tender note might be convenient for certain purposes, and yet all that you do with reference to the metal, when you stamp it is to put a certain stamp upon it, all that you do in substance, that is?—No; by placing that stamp upon it you assert that it shall be a quittance for debt contracted in terms of the money of the realm, and by that very Act which Sir Robert Peel was then discussing—the Act of 1844—it was enacted that the Bank should purchase bullion in exchange for those legal tender notes; that very Act provided it.

26,564. Is there any real difference made by calling it the money of the realm?—Yes.

26,565. The gold, when the stamp is put upon it, remains a commodity as it was before, and this exchange value is regulated like any other commodity; is that your opinion?—Not altogether, because that very fact of putting the stamp upon it at once causes a very large demand, and the principal demand, for it.

26,566. Is that the opinion upon which the English monetary policy has been based?—No, certainly not; pardon me for putting the thing so bluntly; I mean to say that it cannot possibly be denied that by making a metal legal tender you cause a demand for it, and if so you alter its value.

26,567. By building line of battle ships you cause a demand for iron?—Yes.

26,568. But you do not fix the value of iron in that way?—You certainly affect it.

26,569. I do not deny that by making it possible to use money in a certain way you affect the value?—That is all I wish to say.

26,570. But that is a totally different question from fixing the ratio?—You cannot fix the ratio between different kinds of gold in that sense, except perhaps that coins may be a little more valuable than the bullion they contain.

Operations of the mint.

26,571. By coining at the Mint the State facilitates the employment of a metal in a particular way; that is about all?—I do not object to that way of putting it.

26,572. It is a better facility?—It is a facility of the greatest possible importance as affecting the value of the metal.

26,573. As a matter of fact at this moment a large part of the bullion upon which our monetary transactions rest is not in the form of English coin at all?—That is so.

26,574. It is merely in the form of foreign coin, or bar gold, or something of that kind?—Quite so.

26,575. And is quite as effective in that form as if it had been coined?—Yes.

26,576. So that the coining at the Mint is not so very material?—No; but that is my argument all through; it is the purchase by the Bank that is the material thing—the purchase of gold in exchange for notes, which notes are legal tender money of the realm.

Purchases of bullion by the Bank of England.

26,577. The Bank buys gold and issues notes, so called, which are merely transferred to another part of the Banking Department, and they are not in circulation at all?—Not in circulation?

Prof. H. S. Foxwell

29 June 1894.

26,578. The circulation of the Bank of England has not changed within the last few months, notwithstanding the enormous increase in the bullion in the Bank of England?—It may not at a particular time, but, of course, they are potentially part of the circulation.

26,579. What is meant by the purchase, except that so much money is deposited in the Bank?—What is meant by the purchase I take it is this: that unlimited quantities of the precious metals can be converted into the shape of money under the 4th clause of the Bank Act of 1844; unlimited quantities of gold can be turned into legal tender by simply presenting them at the Bank.

26,580. But, as a matter of fact, nothing happens apparently beyond that; you take the gold to the Bank of England, and you are credited with a deposit of so much money?—Yes.

26,581. And that is all there is?—Against which deposit you can draw for whatever purposes you require to draw.

26,582. But where does the legal tender come in?—The legal tender comes in surely in the fact that you are able to obtain the means of making a purchase or of acquitting a debt. You have the power of drawing, through your account at the bank, that which will acquit a debt or purchase commodities.

26,583. Whether it is called legal tender or not, you can make the purchase if you have got the article?—If you have got the article of silver, for instance, you cannot make a purchase in this country.

26,584. You can sell it for the standard commodity, and make the purchase; it is only a very short step?—You cannot sell it at a fixed price. There is no fixed relation between a quantity of silver and a debt.

26,585. You do not sell the gold at a fixed price?—There is a fixed relation between a given debt of money and a quantity of gold. An ounce of gold will always discharge a debt of money to the value of 3*l.* 17*s.* 10½*d.*

26,586. Because that is the contract?—That is the contract, and under bimetallism the contract would equally be that 20 ounces of silver would in the same way discharge the debt.

26,587. You do not admit that these views which you have expressed are a little different from the whole style of thinking and legislation on the subject 30 or 40 years ago?—No; on the contrary, I trace these views really to Ricardo's *Proposals for an Economic and Secure Currency*. It appears to me that the history of the purchase by the Bank, to put the thing roughly, is this: Ricardo set forth his views as to an ideal currency; he thought that such a currency should be based upon gold or silver bars purchased by the Bank at a fixed price, and not upon coins—it should not consist of coined gold or silver; later, when we undertook to resume payments upon a cash basis, the value of the gold in paper was at that time considerably above its mint price, and the question was how we should return to the Mint price of 3*l.* 17*s.* 10½*d.*; it was then ordered under the Act of 1819 that we should return by the system of Bank purchase; that the Bank should purchase gold at varying rates, varying from about 4*l.* 1*s.*, if I remember rightly, down to and ending with 3*l.* 17*s.* 10½*d.* It seems to me that that was what probably introduced this idea into our legislation of the purchase by the Bank of gold; I should be inclined to trace it back to Ricardo. Then I find that in a Committee sitting upon the Mint in 1837, Mr. Haggard, who was then at the head of the Bullion Department of the Bank of England, gave evidence that the Bank had been in the habit of buying gold in this way, after the resumption, apparently not under any statute, at the rate of 3*l.* 17*s.* 6*d.*, and that since the year 1828 the price had been raised to 3*l.* 17*s.* 9*d.* That appeared to be the rate at which the Bank was then, in 1837, habitually buying gold, and I presume that Sir Robert Peel, in the Act of 1844, merely accepted the fact, and made it a statutory obligation on the part of the Bank to continue buying at that rate at which it had been buying.

26,588. But still it is only a question of convenience?—It is a very important question, I think, keeping in view the increasing tendency not to use coin, and the preference for paper in all its forms.

26,589. But still it is only a question of convenience; and the value of gold in relation to other things surely

Prof. H. S. Foxwell.

29 June 1894.

continues to be determined as that of any other commodity is?—Yes, no doubt it is affected by the ordinary market causes, only that these monetary demands become the most important of the market influences affecting its value.

26,590. Not in quantity, does it?—Perhaps not in quantity, if you mean by that that of the annual production, the largest portion does not go to currency purposes.

26,591. That is what I mean?—But if you take the stocks existing I think it might be doubtful.

26,592. You admit that the largest proportion of the production probably does not go for that use at all?—I think probably not, certainly not.

26,593. Still you do not admit that to any extent your views are different from the views of the great authorities who laid down that a sovereign was merely so many grains of gold, and that all the Government did was to put a stamp on it to show its weight and fineness, the doctrine, I think, which is laid down by Adam Smith and Ricardo and other authorities continuously for generations?—I do not admit that the question was raised very distinctly before them. I certainly could not admit for a moment that Ricardo would take that view, because it was he who was the author of this purchase plan.

Demand for money.

26,594. But Ricardo takes the view that gold was a commodity, and had its value like other commodities?—Subject, of course, always to this, that it has a very special monetary demand, which is of an unlimited character.

26,595. Not of an unlimited character?—I think so.

26,596. What do you mean by unlimited?—I cannot conceive a case in which money would be refused, and therefore the demand for money is practically unlimited.

26,597. But it is surely limited by the capacities and tastes and customs of the people who take it and who pay it away?—There I think we differ rather. I should like to bring out the point of difference. You said on a previous occasion that a country could only take a limited amount of gold, but surely the quantity of gold a country takes depends upon the height of prices; if prices are very low they only want a certain quantity of gold, but if prices are high they would take a larger quantity of gold.

26,598. It depends upon many considerations, of which that may or may not be one of importance?—I should have thought it was a vital consideration.

26,599. It may or may not be of importance. Suppose the rise of prices takes place at the time very great economies in the handling of money are being effected, a particular nation might not add to its quantity of the precious metals at all?—Do I understand you to suggest that gold would be refused by any nation, that the tender of money would be refused?

26,600. I am merely speaking of the common practice that money is like a machine which goes round, it circulates; what one man gets he pays away, and the ultimate effect is that a community only uses a certain quantity for the purposes of currency?—Yes.

26,601. There is nothing in the nature of an unlimited demand. I wish to know in what sense you use the word unlimited?—In this sense, that if a continent of gold were discovered to-morrow there would be a demand for it instantly. Under the system of free mintage the whole of it might be turned into money, unquestionably the greater part would be turned into money. Of course, the demand for the Arts would not increase to the same extent as this sudden supply, and, therefore, miners having this gold to dispose of would inevitably take it to the national mints of the world. They would turn it into money; the money would purchase commodities and go into circulation, and so prices would rise.

26,602. Would the money go into circulation beyond what the people take of it; they would try to use it in other ways and to get quit of it, as they do all other kinds of money?—I do not understand that suggestion. It seems to me that people are always ready to take money in exchange for goods.

26,603. That is the sense in which you are using the word unlimited; you admit that the quantity of precious metals which a community uses depends, to a large extent, upon its habits and customs?—Relatively, one nation may use less gold than another, but still, if there is a general and considerable increased quantity of gold at any time, all nations will increase their consumption of gold, though some may take less than others, on account of the economies to which you have referred.

Prof. H. S. Foxwell.

29 June 1894.

26,604. The consumption might increase in the form of greater use in the arts, or of hoarding?—It might.

26,605. And not in the form of the direct circulation of money?—I do not know that it would increase in the shape of hoarding in Europe at all.

26,606. Still in India it might be so?—Yes.

Effects of bimetallism on the demand for gold and silver money.

26,607. Have you made any calculation as to the reduction in the quantity of gold now in monetary use which would follow on the change you propose, and the increase in the quantity of silver in monetary use that would take place?—No, I do not see very well what grounds you would have for such a calculation.

26,608. You assume that the quantity of money in use is going to increase a good deal?—Yes.

26,609. But if it should happen that the gold which goes out of use is replaced by silver, and that no more silver than that comes into use, I do not see where the increase in the quantity of money comes. Have you made any calculation?—I think we have been arguing that there would have been an increase in the production of silver.

26,610. Have you made any calculation?—The thing is not susceptible of arithmetical calculation, surely.

26,611. Still these are subjects on which you are capable of forming some sort of estimate as to what will happen?—A rough estimate. I doubt whether it would be possible. This would be a preliminary consideration:—What would be the extent of the increase in the production of silver?

26,612. How much more silver would you use if the change was made?—Do you mean as coin? Probably none; my own view is that there would be probably no more silver coin used.

26,613. Then what would there be in the form of reserves?—That would be unlimited. It would just depend upon the amount of silver bars brought to this Mint to be sold, or to the French mint, or some other equally available national mint.

26,614. I must again ask in what sense "unlimited." It must be owned by somebody, and nobody is going to keep money without some idea what he will use it for?—It will be used in the purchase of goods, and prices would rise.

26,615. The moment he purchases goods that particular person ceases to be the owner of it?—Yes.

26,616. The person who sells the goods immediately buys something else probably too?—Yes.

26,617. Consequently there would be no increase of stock anywhere unless somebody held the stock?—I do not quite understand what you mean. Let us take the Australian discoveries; we know that there was an enormous increase in the stock of money at that time.

26,618. At the present moment there are 40 millions of gold in the Bank of England?—Yes.

26,619. Which belongs to somebody in some form or other?—Yes.

26,620. People are content instead of using the money to let it lie in that form?—Yes.

26,620*a*. But the fact that it is lying in that form is a proof that some people are content to make that use of it, but that is a matter of choice on their part?—Do you suggest that that money is idle?

26,621. I make no such suggestion about it, I suggest that it lies there on account of the will of A, B, C, and D about it?—According to my view, that money is in circulation very largely. It is either issue reserve, in which case it is circulating in the shape of bank notes; or it is banking reserve, in which case it must be held to meet the enormous mass of English banking liabilities which rest upon it.

26,622. In any case it is a much larger sum than usual, and it is held because A, B, C, and D, wish to have it there?—Yes.

26,623. That is quite evident as a matter of fact?—Yes.

Views of economists on bimetallism.

26,624. I should like to ask you now with reference to the suggestion which, I think, you made in reply to

Prof. H. S. Foxwell.

29 June 1894.

one question, that most economists of the present day are of your opinion, would that be true of economists in France?—It was on the question of theory, was it not?

26,625. Yes?—I should like to say that I was referring simply to the theory of bimetallism. I do not for a moment claim that all economists are in favour of the introduction of bimetallism. They are rather in the position the Royal Commission was in—they admit the theory.

26,626. You do not say that of the French economists, do you?—I do not think it is true of the majority of the official economists, those who are at present occupying the chairs.

26,627. With regard to the United States?—Of course the most distinguished economist there, General Walker, is the leader of the bimetallic party.

26,628. You have heard of such names as Taussig?—Yes, Mr. Taussig certainly admits the theory.

26,629. Mr. David Wells?—David Wells dates from a previous generation.

26,630. And Mr. Atkinson?—I do not regard Mr. Atkinson as an economist at all.

26,631. Mr. Atkinson is very well known on this side of the world?—It has been remarked to me again and again by American professors that they have been astonished at the importance which is attached to the economic opinions of Mr. Atkinson on this side. He has made the most astonishing blunders on points of economic theory.

26,632. (*Chairman.*) Do you mean that you disagree with him, or that he denies the theory?—I mean that he has made most astonishing blunders in regard to ordinary and accepted matters of economic science.

26,633. (*Mr. Giffen.*) Then there is Mr. Laughlin?—Mr. Laughlin, I admit, is against us.

26,634. So that there is a very appreciable body of opinion against you in the United States?—I do not know that Mr. Laughlin is against the theory of substitution, which was the point I was particularly speaking to at the time. A man may be a monometallist and yet accept this theory. Thus the theory of substitution was accepted by the late Lord Bramwell, who was not a bimetallist, and by Mr. Leonard Courtney, at a time when he also was not a bimetallist.

26,635. Then in Austria, you are aware that at the recent inquiries which were made there were very few bimetallists who responded to the Austrian Government, I think only two out of about 38?—If we want to go into the opinion of German economists——

26,636. This is Austrian I am on?—Yes, I have a paper kindly prepared for me by Dr. Gyula Beck of Buda-Pesth, in which he has taken the trouble to make a list of all the economists of Central Europe, who have written on the monetary question. He has been going on a monetary tour of late, and he has given me their opinions. A large majority are in favour of bimetallism, positively in favour of the adoption of it, not merely in favour of the theory.

26,637. This is a case where you must not really count names, but where one wishes to know what is the sort of general balance of opinion rather?—It is always subject to this: it is rather a delicate thing to say, but it is, I think, pretty well known that some of the economists abroad are in a semi-official position, and that when they are placed upon monetary commissions they are sometimes placed there with very definite instructions as to the intentions and wishes of their respective Governments.

26,638. The opinion of Austria, which was the latest country that has changed its standard, is in favour of a single standard?—Undoubtedly, but the question before them was: "We have Europe in the main upon "a gold standard. We have the influence of England "and other countries, perhaps, against any change. "That being the case, what we have to consider is "whether we should remain upon a bimetallic standard, "or whether we should assimilate our currency to the "currency of other countries."

26,639. I suppose that down to a very recent date you would admit that opinion was preponderatingly in favour of the mono-metallic view?—Yes.

26,640. And also in favour of the view that governments could not fix the ratio?—I do not think that point had really been very seriously considered in this country. I do not remember to have seen any serious argument against the possibility of fixing the ratio; there is the well-known argument of Mill, that is rather a trumpery one.

Prof. H. S. Foxwell

29 June 1894.

26,641. Mill is a very high authority?—Not specially upon money, I think.

26,642. Mill and Fawcett, and Mr. Bagehot?—Mr. Bagehot would be a higher authority upon that point.

26,643. Up to a very recent date the opinion was so unanimous against bimetallism that Mr. Hendriks at that Monetary Commission in Paris in 1870, to which you have referred, affirmed absolutely that the bimetallist opinion was totally insignificant in England, and not worth considering?—That would be the case in 1869, undoubtedly.

26,644. It was true at that time?—Yes, undoubtedly; but I ought to say this: it was not as if the question had been discussed, and that opinion had been arrived at after discussion; the question had never been raised, but there was a general presumption in favour of the established system.

26,645. Have you read Mr. Hendriks' evidence before that Commission?—It is very long. I have read some of it, but not all.

26,646. Can you say in view of that that the question had never been raised?—Not in England generally. You see no trace of it in any of the treatises on political economy.

26,647. To a certain extent it had been raised, and I believe Mr. Hendriks was a very competent person to discuss the subject?—Yes.

26,648. And was as fully acquainted with the arguments as any man could be?—He was not very fully acquainted with the new arguments of Wolowski. Wolowski's book only appeared after he gave that evidence.

26,649. Wolowski's book?—1870 was the date of his book.

Wolowski's views on bimetallism.

26,650. I think Mr. Hendriks was very well acquainted, personally, with Wolowski, so that that would not make much difference?—It was quite a new thing to Mr. Jevons, for example, who says, in his letter to Wolowski, that it was a new idea to him; and Jevons says, I am bound to say you are right in your theory; but it evidently came upon Jevons as rather a surprise, and as something new.

26,651. Do you consider Wolowski to be the author of the new bimetallism?—Practically, so far as the theory is concerned.

26,652. He has made many converts in England, but not many in France?—I think he has made a great many in France; of course, M. Cernuschi was one of his converts.

26,653. M. Wolowski was not of opinion, I think, to the best of my recollection, that a fixed ratio could be be maintained indefinitely?—In face of any possible changes in the production of the metals?

26,654. I think that M. Wolowski, to the best of my recollection, was of opinion that it might be necessary to change the ratio from time to time?—And so I think it might have been with bi-metallism limited to the Latin Union, and all the rest of the countries mono-metallic.

26,655. He did not express an opinion on this great subject of international bi-metallism?—Surely he was in favour of international bi-metallism.

26,656. But still he had not considered this question of having it international except making them do it nationally; he was in favour of every nation doing it of itself, without an international rule?—What he protested against was the demonetisation of silver, and his main object was to put a stop to that movement, which was then commencing, of the demonetisation of silver. He would have been satisfied with the *status quo*.

26,657. So that bi-metallists who admit of alteration, and who admit that a ratio could not be maintained are not quite in the same category as those who say that the ratio once fixed will be maintained?—But the circumstances are totally different. The new bi-metallists say that if you have an international agreement, the ratio could be permanently maintained within any limits which are necessary.

26,658. Do you say Wolowski was in favour of that opinion?—I think it is absolutely certain that he would

Prof. H. S. Foxwell.

29 June 1894.

Inquiry by Gold and Silver Commission.

have been in favour of it. The whole drift of his argument is in that direction. Do you think he would have opposed it?

26,659. (*Chairman.*) Did you give evidence before the Commission on gold and silver?—No.

26,660. I presume you have read the evidence before that Commission?—Yes.

26,661. Am I right in saying that all the questions which you have laid before us during the last two days of your examination were fully gone into before that Commission?—I do not think they were all fully gone into.

26,662. Still they were all gone into, all the questions arising from the monetary changes in Europe?—Yes; those questions were, certainly.

26,663. And the monetary changes in the United States?—Yes.

26,664. And the difficulties arising from the exchange with India?—Yes, but they were not so acute then.

26,665. Were not those particular topics reported upon by the Commission?—Yes.

26,666. And also your recommendations as to bi-metallism—I will not say fully according to your view—but were they not at length entered into by the Royal Commission?—Yes.

26,667. And the Royal Commission was evenly divided on the subject, I think?—Yes.

26,668. (*Mr. Chaplin.*) Is that still the opinion of the members of the Commission?—Perhaps it would be fair that I should say that since that Commission has reported Mr. Leonard Courtney has published an expression of opinion, to the effect that he had seen reason to alter his view and that he would now have signed the Report in favour of bi-metallism.

26,669. (*Chairman.*) With that exception, I presume, we may take it that those members who were against bi-metallism retain the same opinion?—Yes; but even there, I think, if my answer is to be taken, I ought to make the distinction that half of them were against recommending the establishment of bi-metallism, but that they were not against the principles or theory of bi-metallism.

26,670. (*Mr. Chaplin.*) They all agreed that it was practicable?—Yes.

26,671. (*Chairman.*) But they were not able to recommend any specific scheme which was laid before them?—No.

26,672. On the contrary, they advised against any scheme which had been laid before them for carrying out bi-metallism?—Yes.

26,673. Six of the Commission were one way, and six the other?—They advised that some measure should be taken to alleviate the fall of prices; they recommended the issue of 1*l.* notes.

26,674. But they expressed very different opinions to what you have done upon some of the main questions at issue?—Yes, upon some of them.

26,675. They did not consider that the fall of prices was largely due to the appreciation of gold?—Surely.

26,676. I think if you will refer to the Reports, you will find that is the case; I am now speaking of the six who were against bi-metallism; those six were opposed to most of the views that you have represented?—To many of them.

26,677. They did not consider that the fall of prices was due to the appreciation of gold largely?—I do not know what to say about that—Mr. Giffen will understand my perplexity—because the fall of prices is the appreciation of gold, but they were not all agreed, perhaps, that that appreciation of gold was due to a monetary cause.

26,678. Let me call your attention to section 47 in the Report of the six: "We do not think that there is "any conclusive evidence of the substantial appreciation of gold to be derived, either from a review of "the variations in prices, or of the circumstances "relating to the production and use of that metal; at "the same time, we are far from denying that there "may have been and probably has been some appreciation, though we think it absolutely impossible to "determine its extent." Then, with reference to an index table of prices, which I think they call the index, they pointed out that the index was deficient, inasmuch as it did not deal with wages?—Yes, I think that was their opinion.

26,679. Have circumstances very materially altered since the Report of that Commisson?—All the unfavourable circumstances that they had under their notice have been aggravated.

Prof. H. S. Foxwell.

29 June 1894.

Relative stability of prices since 1885 and before 1873 compared.

26,680. I should like you to look at the table you put in of Mr. Sauerbeck's, and especially at the last nine years of that table, from 1885 to the present time (*see* Appendix). I would ask you whether, on the whole, there has not been a certain stability of prices according to that table?—Relatively, perhaps, to what happened immediately before.

26,681. I would ask you whether, in the whole range of the period that you give, from 1820 to the present time, there ever was a period of nine years when there was so great stability of prices as during the last nine years?—Yes, I should think the period between 1860 and 1870 was quite as stable, and the period between 1828 and 1834 was, on the whole, a steady period.

26,682. I should say that 1860 to 1870 was hardly so stable as the last nine years; there is a greater range of prices in that period?—The width of the fluctuation, perhaps, is more.

26,683. It went to a higher point during those 10 years, as compared with the average during the last nine years?—The average of the years 1853 to 1877 was wonderfully steady, but the width of the fluctuation was a little more, because there was more speculation and speculative activity.

26,684. Taking the table generally, would you not say that during the period before 1873, when you admit that bi-metallism existed, there was a greater range of variation of prices up and down than there has been during the last nine years?—Yes, the speculative variation was greater, but there was not such a marked alteration in the general level of prices—in the value of the standard.

26,685. The special variations from year to year were greater?—They were greater.

26,686. Were they not more extraordinary and more remarkable even than they have been during the last nine years?—You would expect in a period of depressed trade that you would not have much movement in any direction.

26,687. Does it not rather indicate that prices to some extent have reached their level?—I am afraid I do not see any reason for that.

26,688. I am not prophesying about the future, but during the last nine years has there not, on the whole, been a fair stability of prices?—I should say that what has happened during the last nine years is very much like what happened in 1877; there was a slight recovery of prices, followed by a continuance of the fall.

26,689. In 1877?—From 1877 to 1880 there was a slight lift, and so we had a slight lift from 1887.

26,690. If you look at your diagram, you will see that the line between 1879 and 1880 is totally different to anything which has occurred during the last nine years?—I make it exactly the same; a rise of four widths nearly, two of those divisions in 1879 and 1880, and in the same way a rise of two of those divisions from 1887 to 1889. That is the whole amount of the lift in each case.

26,691. Between 1879 and 1880 was after bi-metallism had been done away with?—It was.

26,692. I am now comparing the last nine years variations with what occurred before 1873 when you say bi-metallism existed?—Yes.

26,693. I ask you whether, on the whole, there has not been greater stability of prices during the last nine years than during almost any period before 1873, taking year by year?—Taking it year by year, the movement of prices has been more steady, undoubtedly, but it has always tended in the same direction, downwards.

26,694. That is another matter, but during the last nine years apparently, according to your own table there has not been much downward tendency; on the contrary, it fell from 1884 to 1886, then it rose from 1887 to 1889 and remained stationary for two years, and then fell again to the point at which it was in 1886?—It is now on 64, four points lower than in 1886.

26,695. Therefore it has not been a continuously downward tendency during the last nine years?—No, not quite continuous.

Prof. H. S. Foxwell. 29 June 1894.

26,696. I am taking your own figures, your own tables, which you have quoted with approval?—I have an explanation partly of that rise in the Sherman Act. The purchase of silver under the Sherman Act undoubtedly produced some inflation of prices then.

26,697. Still, whatever it may be due to, there has been a stability of prices during the last nine years on the whole as compared with previous times, and especially as compared with what existed before 1873?—I think we may admit that there has been a certain relative stability.

26,698. I think you stated that one of the main objects of the change is to create greater stability?—Yes.

26,699. Is it not, therefore, very important to determine whether during the last nine years there has been greater or less stability than existed before bi-metallism was done away with?—I have already said if you take periods of nine years you can get stable periods before bi-metallism, but I admit that the speculative fluctuation since bi-metallism ceased has been less than it was before, partly, I think, because prices have been steadily falling and trade has been depressed, and partly because our banking system has been very much improved during the last 25 years.

26,700. But still you admit the fact?—I admit the fact.

26,701. That there have been less variations from year to year, especially during the last nine years, than there were before bi-metallism was done away with?—Yes.

Depreciation of gold prices: its effect on production and labour.

26,702. Now, I understand you to say that the depreciation of the principal articles of consumption and manufacture as measured in gold is about 33 per cent.?—Yes, more at this moment.

26,703. But, of course, one can hardly take the present year; let us take it 1893 as the date which we must go upon; I think the general result of your evidence is that that has had an injurious effect upon the industry and production of the country?—Yes.

26,704. And has made the people poorer than they otherwise would have been?—Than they otherwise would have been.

26,705. And has been especially injurious as regards production?—Yes.

26,706. That is the main point of your argument?—Yes.

26,707. Then, as regards labour, I understand you to say that the labourers would after a time feel the effects of the depreciation of prices injuriously?—Yes.

26,708. That though for a time the money that they might get as their wages would be greater, yet that wages would necessarily fall, and there would be a want of employment, and they would suffer, after an interval of time, more or less?—Yes.

26,709. Now, what do you consider the interval of time which would be necessary for the development of these injurious effects upon labour?—I should think perhaps seven or eight years, or something of that sort.

26,710. Then the depreciation of prices began in 1873?—Yes.

26,711. And you would expect at all events before seven or eight years to perceive these injurious effects as regards labour?—Yes.

26,712. A fall in the money prices of labour wages?—Not necessarily.

26,713. And a want of employment due to the hindrance given to production by depression of prices, and I presume a concomitant increase in the price of commodities?—My argument was that the circumstance of the fall of prices tended to injure the position of the labourer after a certain term of years, as you have mentioned.

26,714. You said just now that after a term of seven or eight years the injurious effect would exhibit itself?—Yes.

26,715. Then I have called your attention to the fact that, as you stated yourself, the depreciation of prices began in 1873. I would expect, therefore, according to your statement and your argument that the injurious effects of the fall of prices would begin to exhibit themselves upon labour by the end of that decade?—Yes, but I have only represented this as one of the circumstances affecting the position of labour, and as an unfavourable circumstance; but there are at least a hundred circumstances connected with the progress of society during the last 30 years which have all been favourable to the position of labour, strengthening the position and tending to an increase of wages. I have never said that the currency disturbance alone would outweigh all the other favourable influences.

Prof. H. S. Foxwell. 29 June 1894.

26,716. But surely, when you are predicting these injurious effects, and when you have stated that the effects of the depreciation is to limit productions and to discourage industry ——?—So far as it goes.

26,717. There would be some evidence of that in the state of things which has occurred in the interval of 20 years, when this very serious state of things was continually occurring year by year?—Yes.

26,718. Now have you tested your theories by actual experience, and by the results upon wages and upon labour during the interval?—It came to me rather in the other way, that my attention was drawn to the depression of trade, and in trying to find out the causes of the depression of trade I was led to inquire into prices.

26,719. I wish to put it to you whether you have studied the results and compared the results with your theories, because after all that is a very important matter for an investigator of these political questions?—Yes.

26,720. Political economists propound theories upon a subject, and then it is important that they should test them by experience and by facts?—In what way should I test them?

26,721. I ask you whether you have tested your theories by the experience of facts during the last 20 years?—Yes, I have to a large extent.

Course of wages and condition of labour since 1873.

26,722. Have you observed what has been the course of wages during those 20 years?—Wages have slightly risen.

26,723. And what has been the condition of the labouring men during that period?—I consider that it has improved undoubtedly during the period.

26,724. Undoubtedly improved?—Yes.

26,725. Then you cannot say that your theories have been fulfilled in respect of the conditions of labour, or of the wages of labour?—Pardon me, I should rather put it this way; if we were to take count of the various agencies which have been at work during the last 30 years, all tending to the improvement of labour, we should have expected a very marked improvement.

26,726. What in the main have those been except the fall of prices; what has been the main reason for the condition of labourers improving except the fall of prices?—I should think partly the increased strength of the Trades Unions, giving them increased bargaining power with the employer, so that they are able to get the utmost advantage from the employer now.

26,727. Do you think that in the long run would tend to maintain wages beyond what they ought to be?—Beyond what they ought to be?

26,728. I presume your argument would be that for a time trades unions might maintain the average of wages to a point which it might not otherwise have reached; but I presume that, as an economist, you would hardly say that that could be maintained for a great length of time?—Yes, I think they can diminish the rate of profits, and that they have diminished it very seriously.

26,729. In the case of the agricultural labourer, do you know whether there are any substantial trades unions existing?—I think not at the present moment.

26,730. Are you aware that practically the money wages of labour have increased in almost every trade during the last 15 years?—Yes, I am prepared to admit that.

26,731. Are you aware that in the case of the agricultural labourer, although in some few districts the wages may be said to have been maintained at their old point, and in some few cases to have been reduced, yet that over a great part of the country the wages of agricultural labourers have been increased?—Yes. But my reply to that would be that we have

Prof. H. S. Foxwell. 29 June 1894.

made an enormous increase in the efficiency of production by our mechanical inventions, and in a hundred other ways.

26,732. Has there been any very serious difference caused by invention in the case of the agricultural employment of labour during the last 20 years?—I am not very well able to state the exact period at which reaping and other labour-saving machines came in, but my impression would be that there have been very considerable increases, according to my own observation, in the last 20 years, in the introduction of labour-saving improvements.

Course of pauperism since 1873.

26,733. Have you observed the course of pauperism during the same period?—Generally, but not very precisely.

26,734. I have had, on this table of Mr. Sauerbeck's, which you have put in, a line marked off showing the changes in respect to pauperism and I should like you to look at it?—I see it is on the whole a steady decline.

26,735. From 1873?—And from 1850, and 1848 still more.

26,736. I am now speaking specially of the period from 1873, downwards, to the present time, which has been the subject, in the main, of your examination; when you consider that, according to your theories, serious results would have occurred as regards the labourers of this country. I would ask you to look at that line, and see whether that line has not proceeded, since 1873, in almost exact parallelism with the fall of prices?—As to the parallelism, I should say, first of all, that the diminution of pauperism has not been so great during the last nine years, when the effects of the fall have been most strongly felt.

26,737. The fall of prices has not been so great in the last nine years?—Still it crosses the curve of prices.

26,738. That is a very small thing compared with the main movement since 1873?—That is an important thing as regards the argument. I think my argument has been entirely misunderstood. I took the greatest pains to say that I never supposed, for a moment, that the fall of prices was of itself a disturbing force of sufficient importance to set back civilization. There are a hundred causes in one direction, and this is one important cause which seems to me to be in the other direction.

26,739. I would ask you to look at the line and see whether there is not a remarkable parallelism between the line indicating the reduction of pauperism and the reduction of prices?—I must call your attention to this, that pauperism diminished just as much when prices were rising from 1848 to 1873. There is an enormous fall in pauperism over that period. I am inclined to attribute the fall of pauperism to a number of causes. If I might mention some I would say the extension of clubs and benefit societies, trades unions—whose members are hardly ever known to come upon the rates—and charity organization, which has had an immense effect in diminishing the charge for out-door relief over the country, and increased emigration.

26,740. I do not think it has diminished the charge throughout the country?—In Cambridge it almost extinguished it at one time.

26,741. It would be confined to very few unions, I suppose. I think you can hardly say there has been a general alteration in that respect?—Then there is national education and technical education, these have all had immense effect, at least, one would hope so.

26,742. Do you think that technical education would have effected the condition of the agricultural labourers?—Not specially the agricultural labourer, I was rather thinking of the general efficiency and the wage-earning power of labour throughout the country.

Increase of population since 1873.

26,743. Now, during the same interval between 1873 and the present time, are you aware that the population of the country has increased by nearly seven millions; that is really between 1871 and 1891 it has increased by seven millions?—Yes.

26,744. Therefore an additional population has been provided for in the country during that interval, of no less than seven millions?—Yes.

26,745. I presume we may take it that four-fifths of those represent the families of the working men?—I should think very likely.

26,746. Therefore there has been a very large employment somehow or other found for working men?—Yes, I should like to compare that with the increase from 1852 to 1873 which, I take it, would be at least as large.

Prof. H. S. Foxwell. 29 June 1894.

27,747. I understand you to say that you considered there had been a great improvement in the condition of labourers previous to 1873?—Yes.

Improvement in condition of labour since 1873.

26,748. Do you not think that on the whole there has been a yet greater improvement since 1873 up to the present time?—In agricultural labour, or labour as a whole?

26,749. Taking labour as a whole?—Yes, taking labour as a whole, the whole set of the age is in favour of improving the condition of the labourer.

26,750. Now take the case of the agricultural labourer?—I should not have thought so in his case.

26,751. Is it not a fact that the wages of agricultural labourers, as I stated a short time ago, in the main, have increased in money?—I am not very familiar with the general result of the wages summary, but in the case of the eastern counties, I should say, certainly not.

26,752. But taking it generally over the country, is it not a fact that the wages of agricultural labourers have increased in money?—I should think that is possible, but it is a very difficult thing to ascertain what is meant exactly by a labourer in these returns.

26,753. Assuming that there is a small increase in the wages of agricultural labourers, is it not also the fact that the low prices of all articles of all kinds which they consume has conferred an enormous advantage upon these agricultural labourers?—No doubt.

26,754. If you are right in saying that the appreciation of gold is 50 per cent., that must mean that the agricultural labourer can get a very much larger amount of food and clothing for his wages than he could before?—I think it would be undoubtedly true of the agricultural labourer that he would have that advantage, particularly in the articles that he consumes.

26,755. It would be especially a cause of improvement to the agricultural labourers?—Yes.

26,756. They probably would have benefitted even more than other labourers?—Yes.

26,757. Because a larger proportion of the articles of their consumption are the elementary ones where the prices have been lowered?—Quite so.

Increased employment for labour since 1873.

26,758. Now looking to the fact that the country has been able to find employment in the interval for seven millions more people?—Not in agriculture; there is a diminished employment there.

26,759. That is so, and perhaps I might call your attention to the fact that the number of agricultural labourers has been reduced in that interval by something like 150,000, of course, representing families to that amount of population?—Quite so.

26,760. Therefore, somewhere or other in the country there has been provided employment, not only for the seven millions more people who have been born and have come into existence since 1871, but also for this number of agricultural labourers who have removed themselves from the agricultural districts into town districts?—I fully admit that.

Effect of monetary changes on production and industry.

26,761. Now in view of all that, do you think you can fairly say that there is evidence that monetary difficulties have caused a serious effect upon the production of the country and the industry of the country?—I think so; I think they have produced a very serious effect, because they have diminished profits and contracted the enterprise of those who have received profits.

26,762. Would you expect to find that exhibited to some extent in the want of employment of people, and in the increase of pauperism if it was really a serious cause?—I think we have met those difficulties by a number of agencies, especially by emigration.

26,763. But still whatever the emigration may be, actually the number of the population in this country has undoubtedly increased by the number I speak of; that is, after taking into account the amount of emigration?—You would have to calculate, in order to go into this matter fully, the gains arising from the improvements in machinery and in efficiency of industry generally, which I dare say are at least 100 per cent. over the period.

26,764. Still does it not occur to you that it is a very remarkable fact that in view of the very serious causes

Prof. H. S. Foxwell.

29 June 1894.

to which you have called the attention of the Commission, and your theories upon the subject, namely, that these monetary difficulties would seriously affect and impede the industry of the country, notwithstanding all that, these seven millions of people and the 150,000 families from the agricultural districts have found employment in this country?—No, I think not. It appears to me that the position is almost similar to the position of a man who was advocating canals, let us say, at the beginning of the century. He might say canals would be an immense assistance to commerce; in place of your hilly roads you would have level means of communication. It might be retorted to him "The popu- "lation is steadily increasing, the trade of the country "is steadily increasing, without canals; what reason "is there for supposing that the introduction of canals "would improve that position of things"?

26,765. You come here to-day to advocate a very serious change in the monetary system of the country?—Yes.

26,766. And you do so on the ground that during the last 20 years the depreciation in prices has had a very serious result upon the industry and production of the country?—There seems to be abundant evidence of that.

26,767. I want you now to state in what direction you see these serious effects?—The Commission on the Depression of Trade brought out a great many of those effects, but they are much worse at the present time.

26,768. I am not going to the Commission on the Depression of Trade, but I am dealing with the facts which are within your knowledge; what facts have you to lay before the Commission which tend to show that the effect of the monetary changes has been serious upon the production of the country?—It is asking me an almost impossible question to ask me to say exactly what effect this has had out of a number of complicated causes, all acting upon the situation.

26,769. Still, as you come here alleging that serious effects have been produced upon the industry and production of the country, I think I am entitled to ask you to say where the effects are?—I certainly relied upon such facts as those which were brought before the Commission, and on my own personal knowledge in Scotland—in Dundee, for example—in Manchester, in Liverpool, and all over the kingdom.

26,770. What are those results?—That the disturbance of the Oriental exchanges has so unfavourably affected trade.

26,771. Are there many men out of employment?—I believe that in Dundee at the present time there is singular distress in the jute industry, according to a letter I received the other day.

26,772. Looking to the general condition of the country, can you say that at this moment, or taking an average of two or three years, that there has been a serious amount of want of employment, or of increased pauperism?—I do not know that it is very serious compared with previous epochs; but there was a very distinct increase of pauperism when prices fell from 1891 to 1894, a very marked increase. There was also an increase in the want of employment over those same years. If you like I can put in some figures as to that.

Condition of the country in 1873 and 1893 compared.

26,773. Now, let me ask you another question. Comparing the present condition of the country with what it was in the year 1873—in the year 1873 prices were inflated were they not?—Yes

26,774. Very highly inflated?—Yes.

26,775. And there was a great deal of speculation going on?—Yes.

26,776. It was generally said that the country was very prosperous. Now compare the state of the country at this moment with what it then was, there is exactly one half the amount of pauperism that there was in 1873, the wages of the labourers have increased in the interval, and the amount which the labourers can get for their money has increased in a greater degree; would you on the whole say that the country was more prosperous then than it is at this moment?—Certainly not, but I have admitted that in the fullest degree throughout. I am merely putting forward this as an improvement

26,777. Then whatever the mischiefs that you think might result from the depreciation of prices and the appreciation of gold, they have at all events not exhibited themselves in any serious degree, or if they have had any effect, according to your view, they have been counteracted by other causes?—Yes, that is my view.

Prof. H. S. Foxwell.

29 June 1894.

Fall in prices and condition of labouring classes.

26,778. And you do not think that the mere fact of the reduction in the price of articles has had an important effect in the improvement of the condition of the labouring people?—As to that I should admit that for a time it would until the adjustment had been brought about. The labouring classes would undoubtedly gain by a fall of prices, but ultimately in the long run I have no hesitation in saying that so far as that particular circumstance is concerned, it appears to me quite clear that it would be unfavourable, that it would be depressing, generally speaking, to enterprise and to trade.

26,779. But I asked you specially upon that point how long you considered it would be before these causes would show themselves, and you said in seven or eight years?—Quite as long as that.

26,780. Then I pointed out that the depreciation has has gone on continuously since 1873, although it has not been so conspicuous during the last nine years?—That is so.

26,781. And I think that you admitted therefore that its evil effects ought to have shown themselves?—I think they have most distinctly.

26,782. You think they have?—Yes.

26,783. Where have they shown themselves?—The Lancashire people are of opinion—the working classes, as well as the employers—that they have shown themselves in a marked degree there.

26,784. I mean as regards the labourer where have they shown themselves?—They have shown themselves in a contraction of certain trades, or a greatly lessened rate of increase.

26,785. Taking the whole country over, I must again advert to this question; have these effects shown themselves seriously in respect of the labourers of the whole country?—They have not shown themselves, because they have been to a certain extent overlaid by the other causes of improvement, but that they have existed I have not the slightest doubt. I find that the working classes are of the same opinion. The Parliamentary Committee of the Trades Unions has taken the question up, and has expressed that opinion.

26,786. (*Mr. Channing.*) In speaking of Lancashire, would you consider the state of Oldham would specially illustrate that?—Yes; I was thinking of Oldham largely when I was speaking just now.

26,787. (*Mr. Dalton.*) Is not Lancashire the least pauperised county in the whole of England at the present time?—I cannot speak to that positively now.

26,788. The rate of pauperism there on the 1st of January last, I think, is the lowest of all; the West Riding the next?—Very likely, I should think.

26,789. And it has been so for many years?—Yes.

Effect of appreciation of gold on debts due to the country.

26,790. (*Chairman.*) Do you consider that no considerable benefit has come to the country through the fall of prices?—On the whole?

26,791. On the whole?—Distinctly not. I am very very strongly of opinion that it has been an injury, not only to this country, but to others.

26,792. I presume you are aware that the indebtedness of other countries to this country is very large?—Yes.

26,793. Have you formed any opinion as to the amount of that indebtedness, and what the interest upon the debts due to this country amounts to?—No, I do not know that I could venture an estimate; I should think perhaps 100,000,000*l.*

26,794. 100,000,000*l.* a year?—On the quoted debts.

26,795. That is to say, the interest on the debts due to this country represents about 100,000,000*l.* a year?—Possibly. I should not like to insist upon it. Mr. Giffen would know much better than I.

26,796. That has been the estimate made by competent people, and you are not prepared to dispute it?—I think it would be something like that.

26,797. That 100,000,000*l.* a year is for the most part payable in gold?—Yes.

26,798. And if your view be accurate that gold has appreciated 50 per cent. then we must take 50 per

Prof. H. S. Foxwell.

29 June 1894.

cent. more produce to liquidate that debt?—Half as much again of produce, no doubt.

26,799. Has that not been an enormous advantage to the country?—Not, I think, in the long run, because there are two set-offs at least against that. In the first place there are repeated bankruptcies and repudiations, and then there are reductions of interest under various terms, conversions, moratoriums, or what not.

26,800. If it had not been for the repudiation of debt or the bankruptcies, you admit that the payment to this country in produce would be half as much again?—No doubt, if we could get it.

26,801. No doubt that would be a very great advantage?—Except in this respect, that it very heavily checks the development of those countries to which we are in the main lenders and investors, and, therefore, it would stop very largely the stream of investment. It is almost impossible, for instance, to develop the railway system of India, because of the very circumstance which you have pointed out, that the pressure of the gold debt has increased.

26,802. But still, looking at the question from the point of view of this country only, is it not a very great advantage to this country that that appreciation of gold has taken place?—I think not. I am trying to put it from the point of view of this country, because we are interested in getting a market for our investments. At the present time it is almost impossible to invest money in silver countries at all, owing to the divergence between silver and gold, and the general increase in the pressure of the gold debt. The investment business I have been told again and again has almost ceased in these new countries, but it was one of our principal industries.

26,803. (*Mr. Chaplin.*) Is there not also a very great danger of our losing the money invested if the fall of prices continues?—We have lost a good deal already.

26,804. (*Chairman.*) That has been going on for 20 years, but have the losses to us in the aggregate been very great?—The loss in Australia and the Argentine Republic would be very heavy, and the check to Indian investment has been very heavy.

26,804*a*. Do the debts of the Argentine Republic form a very large amount of the total due to this country?—I have the facts with regard to the Australian bank failures. I am sorry to say that I have not brought them with me, but they were very large indeed, 80,000,000*l*. I should think.

Effect of fall in prices on imports and exports compared.

26,805. Have you ever compared the value of the imports of this country with what they were in the years 1870 to 1874; supposing the prices of 1870 to 1874 had been maintained, have you considered what we should be now paying for the articles imported into this country?—Of course it would be a very much larger sum; on the other hand, our exports which are set against it would have also risen.

26,806. Are you also aware that the exports have not fallen in value in at all the same proportion as the imports?—No, I was not aware that the discrepancy would be very considerable.

26,807. Taking the fact that the wages in this country have not been diminished but rather increased, and that the general operation of manufacture is to import articles of produce, to work them up by means of labour in this country, and to export them again, would it not follow almost as a necessary consequence that the fall in the prices of exports has not been at all in proportion to the fall in the prices of imports?—No, I think I could not admit that as a matter of theory.

26,808. I have just been asking you with regard to the value of articles imported into this country at the present moment, as compared with their value 20 years ago. Are you aware that the articles of food alone, imported into this country, at the present time, if they were valued at the prices which they were at 20 years ago, from 1870 to 1874, would now be valued at 200,000,000*l*. as compared with their present value of 138,000,000*l*., making a difference of 62,000,000*l*.?—I am prepared to believe that.

26,809. Do you not believe it to be an advantage to this country as a whole that that enormous importation of food at these reduced prices should be made?—Undoubtedly, so far as it goes, but it is counterbalanced, on the other hand, by an equal reduction in the price of our exports.

26,810. I have already tried to point out to you that there has not been any corresponding reduction in the prices of exports?—I do not follow that.

Prof. H. S. Foxwell.

29 June 1894.

26,811. I think you will find that there has been no corresponding reduction; there has been some reduction in value, but not at all comparable to the reduction in the imports. In the case of the exports, the only reduction in value would be the reduction in the value of the raw material, and to whatever extent that value has been added to by labour there has been no reduction, on the contrary, perhaps somewhat of an increase, owing to the fact that the wages of labourers have increased and not diminished?—Yes.

26,812. In view of that, do you not consider that it is a very great advantage, not only to the consumers of this country, but also to the trade of this country, that there should be these immense importations at these prices?—My impression is, that the cost of labour has diminished in this country. It is true that wages may have increased, but the cost per unit turned out by the labourer has diminished. I do not admit that the value paid to the labourer per unit of work has increased. Such gain as there has been in wages has been owing to the increased efficiency of labour—certainly in the cotton and the textile trades.

26,813. The main process of manufacture is in applying labour to commerce?—Yes.

26,814. If the wages of the labourers have increased, unless there has been some great improvement in machinery, there cannot be a corresponding reduction in the price of exports as compared with imports?—If you are going to take the imports of food at the increased price, you must also take the exports at the increased price, which they certainly would have had if prices had risen in the same degree.

26,815. But not in the same proportion?—I think in the same proportion.

26,816. Then I need hardly point out to you that there is an enormous excess of imports over exports?—I admit that.

26,817. Assuming that there are no further investments abroad that must mean something like from 70,000,000*l*. to 100,000,000*l*.—probably it would be 100,000,000*l*.—that would be due to this country in the shape of interest?—That is only the question we have had before of the effect of investments; it is not a new point.

26,818. If no further investments took place abroad, then the balance due to this country must be something like 100,000,000*l*.?—Then you are taking into account the transport; of course it must be balanced by something.

26,819. I think you admitted that 100,000,000*l*. was a fair estimate of the interest on the debt to this country?—I do not want to lay any stress on that figure, but I think it is something like that.

26,820. Assuming other things are equal, and there is no further investment abroad, in any particular year, that 100,000,000*l*. would have to come into this country in the shape of imports over exports?—I quite admit that; I am only saying it is not a new point, it is the same point you raised before; it is not an additional point arising out of imports and exports.

26,821. You admit an enormous advantage to the country having that excess of imports over exports, and that debt due to the country payable in that appreciated currency?—Yes, but I am perfectly convinced myself we should have been in a better position in regard to that trade on the whole if prices had been stable, because of the set-offs I mentioned—the repudiation of debts and the reduction of interest discouraging every possibility of further investments in those countries at the present time.

26,822. Do you think that pauperism might have been reduced still more?—I do.

26,823. And that the savings of the country might have been still greater?—Much greater.

26,824. Are you aware that the investments of the labouring classes in the Post Office and trustee savings banks have doubled during the last 20 years?—I should expect that, but I have not the figures before me.

26,825. They have risen from 53,000,000*l*. to 100,000,000*l*., I believe?—Yes, over 100,000,000*l*.

Objects of bimetallism.

26,826. In view of the evils which you consider have resulted from the depreciation of prices, you propose

Prof. H. S. Foxwell.

29 June 1894.

this scheme of bimetallism, the main objects of which are two-fold; first to create greater stability of prices, and, secondly, to raise prices?—I did not put the raising of prices as the direct object. I should say before the raising of prices, the fixing of the ratio of exchange, the par of exchange, between gold and silver using countries. That would be the second object of importance, but some persons would put it as the first object.

26,827. (*Mr. Chaplin.*) What do you put as the first object?—I should myself, on the whole, put as the first object the checking of the fall of prices.

26,828. (*Chairman.*) The checking of the fall of prices?—Yes, and to preserve in the future the relative stability of prices.

Effect of bimetallism on prices.

26,829. I think I understood from you that you consider the effect of the change would be to raise prices?—Yes, because before you could get to the ratio which would ultimately promise the greatest stability, you would have to rise from the present low level of market prices. I do not put the rise of prices as a substantial object.

26,830. Instead of adopting the present ratio, which is 33 to 1, you propose to adopt the ratio of 20 to 1?—Yes.

26,831. I think you admit that the effect of that would be to raise prices?—I think it would, but on the whole it would give us the greatest promise of stability in the future, when we have once reached that point.

26,832. But the immediate effect of the change would be to raise prices?—Yes.

26,833. I think I understood you to say that you were against fixing the ratio of 15½ to 1, on the ground that it might be dangerous?—I think myself that it would raise prices too much.

26,834. On the ground, then, that it would raise prices too much?—That you might have an excessive supply of monetary metal; on the whole, I think so.

26,835. I presume it would be a dangerous operation?—No, I do not know that it would be dangerous, but it would bring about such evils as result from a rise of prices; and, of course, I admit there are evils arising from that.

26,836. You admit that evils might result from a rise of prices?—Yes.

26,837. But you are prepared to incur that evil?—Up to a certain extent.

26,838. Up to the difference between 33 to 1 and 20 to 1?—Yes.

26,839. But you would not go further, you would not go to 15½ to 1?—I think that probably the supply of the metals would be excessive. It is, of course, a matter of estimate.

26,840. Then, as I understand, you admit there would be an immediate rise of prices?—Yes.

26,841. I presume you would say that things would adjust themselves after a time to that?—Yes.

Effect of rise in prices on condition of labourers.

26,842. But immediately the labourers would suffer?—I do not think they would suffer, because I think immediately on the introduction of these measures there would be a great demand for labour. There has been hardly any investment of capital in the London market recently.

26,843. Would not the process be the exact reverse of what has taken place during the last 20 years?—I think not.

26,844. That is to say, instead of the labourer benefiting from the fall of prices, as you admit he has done——?—Yes.

26,845. Would he not suffer from the rise of prices?—I should say it would be rather parallel to what took place in 1850. There was a rise of prices then with the greatest possible advantage to the labourer, as your curve of pauperism shows. Pauperism diminished very rapidly in the year immediately after 1850, more rapidly perhaps than at any other time, because co-extensive with that rise in prices there was a very great increase in the demand for labour, because there was a great outburst of enterprise.

26,846. Still, apart from any additional demand for labour—if there should not prove to be an additional demand—then the labourers would suffer, inasmuch as they would have to pay a higher price for commodities consumed?—Yes, but certainly there would be such a demand.

Prof. H. S. Foxwell.

29 June 1894.

26,847. The one is a possibility whereas the other is a certainty?—Yes, but there are immense amounts of capital ready to be placed if there were the slightest possibility of a settlement of the monetary question.

26,848. You admit this I think, that the one is a possibility and the other a certainty; it is certain that the labourers would suffer from the rise of price, it is only a possibility that they would gain from the increased employment?—It is a probability of the highest degree, I should say.

26,849. Is it not a certainty that they would suffer from a rise of price *pro tanto*?—*Pro tanto*, yes; undoubtedly.

26,849*a*. Therefore, so far as that is concerned, you would be reversing the process which has taken place during the last few years?—To some extent we should be, but I should rather say that we should be practically repeating what took place in the years 1850 to 1854 which were highly favourable to the labourers.

Determination of the ratio.

26,850. Now, assuming that there is to be this double standard, and that there is to be a convention between nations with the view of establishing a ratio between gold and silver, who is to decide, according to your view, what that ratio should be? You have expressed your own opinion that it should be 20 to 1, but who is to decide that? Is that to be a matter in which the majority of nations concerned is to decide, or is it to be subject to the approval of all and every one of them? You may easily see that it is a matter of supreme importance, if this country is to go into a conference on this subject, that it should know whether it is to be at the mercy of the majority of other countries so that the ratio might possibly be pushed up to 15½ to 1, instead of 20 to 1, as you suggested, or whether it is to be entirely at the discretion or subject to the approval of this country alone?—I do not know that my opinion on that is of any value. But though the nations would go into the conference ostensibly upon equal terms—I believe it is usual for European nations to appear upon ostensibly equal terms—I should suppose that certainly the great commercial nations would have the predominant influence in such a conference, and if, as the result of their deliberations, a resolution was adopted which appeared to the Government representing this country to be one they could not accept, of course the agreement would not be accepted.

Climbing ratio.

26,851. I understood you to say that you yourself prefer a climbing ratio?—I was speaking of the mode of transition.

26,852. The mode of transition is to be a climbing ratio?—Yes.

26,853. This ratio would be begun at a low point, I presume?—Something like the market price.

26,854. And gradually rise?—Yes.

26,855. Therefore, I presume, it would depend on the Conference, or on the majority of the Conference, or on the Powers from time to time, how that climbing ratio should be carried out?—Undoubtedly; they would have to agree as to the point at which it should start.

26,856. Did you in preferring the climbing ratio do so on the ground that you consider there would be danger in taking the step at once from 33 to 1 to 20 to 1?—I should be opposed in general to any large and sudden monetary changes, particularly in the ratio, which affects a large mass of trade.

26,857. It might give rise to monetary disturbance?—It would disturb the trade with the East very much, I think.

26,858. And it might give rise to alarm possibly if you took so bold a step at once?—It has been represented to me purely as a matter of Eastern exchange, that a sudden variation in the Eastern exchange would be objectionable, even to those who are very strong advocates of a bi-metallic settlement.

Bimetallism and past and future contracts in gold.

26,859. Now, going a little further, what do you contemplate when your scheme has come into operation; are contracts in gold to be prohibited in future, or not?—I do not think there would be any need to prohibit them. It is not part of any scheme that I am acquainted with.

26,860. I want to know whether it would be competent for people after your scheme is in operation to contract in gold or not?—Personally, I should prefer to leave it quite open to them.

Prof. H. S Foxwell. 29 June 1894.

26,861. You mean that there should be full liberty to contract in gold?—Yes.

26,862. Then, as regards the future, debtors and creditors, or the persons who are going to adopt that relation to one another, are to be entitled, if they think fit, to contract in gold?—Just as they might in corn, or in anything else.

26,863. Now, as regards past contracts, where contracts in the past have been made in gold, are they, according to your view, to be paid in silver in the future?—They would be paid in the general standard, which would be a double one.

26,864. Why should a contract in the past be less sacred than a contract in the future; if you permit contracts to be made in the future in gold, why not also recognise contracts which have been made in the past in gold? I should have thought myself that it was rather a more violent interference with the freedom of contract to interfere with past contracts than with future ones?—Pardon me, the way in which I look at it is this: By the law of the country it is open to anyone to contract in any commodity he pleases, and I do not propose to alter the law of the country in that respect, though it was suspended in the years of the Bank suspension.

26,865. Not as regards the future?—No.

26,866. But you are proposing to alter it as regards the past?—No, that permission to contract in any commodity remains.

26,867. But there are a great many contracts made between people in this country and people abroad payable in gold?—Payable in legal tender.

26,868. Contracts not subject to the laws of this country with regard to our currency—— ?—Yes, I think so.

26,869. But actual contracts payable in gold?—Specifically?

26,870. Are those contracts to be interfered with, and is it to be open to people in the Argentine Republic to pay their debts in this depreciated currency?—That would be a matter of private international law; it would not be a matter of domestic law.

26,871. I want to know what your view is on the matter. Do you consider that these contracts should be interfered with, and that in future, under your scheme, these contracts payable in gold between people of the two countries should be liquidated in this depreciated currency?—I do not like to give an opinion on an international question, because the law is extremely complicated, as I happen to know, having at one time studied it a little. But I should like to say, as regards the domestic contract, certainly, that if the contract has been made specifically in a metal the contract would be enforced by the courts exactly as a contract made specifically in corn; but if the contract was made in legal tender, in the ordinary sense of the word, then it would follow the law of legal tender, whatever it might be, enacted by the State.

26,872. Still it does seem to me important that we should know what is your view with regard to this enormous mass of contracts which are payable in gold which have been made between the people of this country and the people of other countries, and whether those contracts are to be liquidated in future under your scheme, in a depreciated currency?—They might remain payable in gold. I do not see any objection to that.

26,873. Is that your view?—I see no objection to it, and no difficulty whatever.

26,874. You think there would be no difficulty in that. Then, assuming those contracts are to be paid in gold in future, why are contracts in this country which have been made with reference to a gold standard, which has been as firmly fixed in the minds of the people who contracted as if the word gold had been mentioned, why should those be liquidated in a depreciated currency, whereas contracts made between the people of this country and the people abroad are to remain payable in gold?—It appears to me in the first place that if the contracts which have been made stipulate that the payment should be made in gold, the payment would remain payable in gold, exactly the same before as after if you like; it might be so, if you please; but if you mean that the value of gold would be altered in consequence of the change, I admit that; but then the value of gold has altered in the last 20 years—very seriously altered—as much as 50 per cent., and no one has complained of that; and why should they complain of an alteration in the opposite direction.

Prof. H. S. Foxwell. 29 June 1894.

26,875. You have admitted that these contracts between the people of this country and people abroad, payable in gold, are to remain payable in gold?—I do not say so; I say that I see no objection to it.

26,876. Why are those to be more sacred than contracts with reference to a gold standard made in this country? Let me take the case of the 100,000,000*l.* of deposits in the savings banks, which are contracts between the Government and the depositors in those savings banks, that the money, the 100,000,000*l.*, would be paid in gold; why are those contracts to be liquidated in future in a depreciated currency, whereas these contracts between people in this country and people abroad are to remain payable in gold?—I think I might answer by asking, why should they be liquidated in an appreciated currency, as they have been during the last 15 years?

26,877. That is not an answer to my question?—If we are dealing with the absolute value of the metal, that has fluctuated from time to time, and no Government has ever guaranteed that an ounce of gold shall always mean the same value in commodities.

26,878. I should have thought that the Act establishing a gold currency amounted to an obligation on the part of the State to pay in so much of gold?—If that was thought to be a serious objection, I do not think there would be any difficulty in continuing to pay in the gold. Of course, it would be the case that the gold would not have such a high value.

26,879. Then do you contemplate the possibility of these deposits in the savings banks being paid in gold?—If any general demand arose for it, I do not see why it should not be. I cannot see why the demand should arise, because the silver would be worth exactly as much as the gold. The 20 ounces of silver then would be worth as much as the ounce of gold, and why should they ask for gold rather than silver?

26,880. You have now admitted the possibility that the savings banks depositors may be paid in gold; let me take the case of depositors in other banks—private banks; can you draw a distinction between them and the depositors in the savings banks?—Only to this extent, that the depositors in savings banks are very simple people, and might suppose there was something wrong, and as it is a small matter, I would be inclined to give them the benefit of the doubt. With regard to others, they would be intelligent enough to see the position.

26,881. It is not a question of what they might suppose, but I think you have admitted that they would be repaid in a depreciated currency, if the scheme was carried out?—That I do not admit, because whether they have gold or silver, the value would be the same; whether you paid them in an ounce of gold or in 20 ounces of silver, the value would be identical measured in commodities. The whole question is whether they would have any preference under those conditions for a payment in gold, rather than a payment in silver; and I think that as soon as they found the two were equally current for all purposes, and were probably represented by a note, in such a way that they could not tell which the note represented, whether the gold or the silver, there would be no difficulty at all.

Mint ratio and market ratio between gold and silver.

26,882. Then is your opinion this: that the effect of your currency arrangement would be, that there must be the same ratio between the price of gold and silver outside the currency?—Undoubtedly.

26,883. That is the basis of your whole argument?—Yes.

26,884. Whatever you determine as the ratio between gold and silver for currency, that will be the market ratio between gold and silver outside?—Yes, subject to the small agios which I have mentioned.

26,885. The whole of your argument turns upon that?—Yes.

26,886. I think you would also admit that if you are wrong in that, then very serious difficulties would arise and must arise in respect of all these questions which I have raised, especially with regard to the deposits in savings banks and in private banks?—Yes, I think some difficulties might arise.

26,887. Would there not be a serious danger of this, that the depositors in savings banks might take a

Prof. H. S. Foxwell. 29 June 1894.

different view from you and your friends as to what might be the effect of bimetallism, unless there is a possibility of maintaining the ratio outside the currency between gold and silver, and expecting the gold to be more valuable, might demand repayment in gold of the money due to them?—All economic reasonings proceed upon rational grounds—upon the supposition that the people are pursuing their interest; but I admit that they may not do this—that they may be irrational and unintelligent. For instance, there were riots when the bronze pennies were introduced, although their introduction injured nobody. I remember disturbances in Somersetshire.

26,888. You would think that it would be wholly irrational on their part?—I think it would be absolutely irrational.

26,889. But suppose any part of them thought otherwise, is it not to be expected that they would demand the money which is due to them?—I should like to say here, that of course this scheme would come before them, recommended by persons in the majority of whom they had confidence. It would come before depositors in savings banks, recommended by the whole of the parliamentary committee of the trades unions, for instance; the working classes have confidence in those men.

26,890. You must admit that there is a serious difference of opinion among people on the subject of bimetallism, and that the Royal Commissioners were equally divided upon the subject?—Not upon the subject of the possibility of preserving a ratio; they were all agreed upon that.

26,891. That was only, I apprehend, for currency purposes?—No, that had reference to the rate of exchange as well.

Demand for gold.

26,892. As I understand, you are contemplating a use of gold outside the monetary system for the payment and liquidation of contracts made in gold?—Specifically made in gold.

26,893. Therefore there would be a demand for gold for other purposes than purely monetary purposes, affecting a particular country which may have adopted the principle of bimetallism?—Yes.

26,894. I think when you have admitted that these enormous debts payable to this country in gold are to be liquidated in gold in future, you must see that there would be a demand for gold for that purpose?—I have never said anything about the international debt, because we have no control whatever over that. In this country, where specific contracts have been entered into, they, of course, would have to be carried out.

26,895. You said a short time ago to me, that you saw no objection to allowing these debts to this country to remain payable in gold?—There is no objection from our point of view, certainly; it would be all to our advantage so far as that goes—or rather there would be no disadvantage.

Continuation of the fall in prices.

26,896. Do you consider that the depreciation of prices will go on?—The appreciation of gold?

26,897. The appreciation of gold?—Yes, I think so.

26,898. Looking at the fact according to your view of the very large appreciation which has already taken place, and therefore to the greater economy which must result in the use of the gold which now exists, and also to the increased output of gold in the world?—Of course it is very difficult to prophesy.

26,899. Having regard to those facts, do you think that we are likely to have a still further serious reduction in prices?—I think, in the first place, we are nothing like at the end of the demonetisation of silver, unless something is going to be done to establish it.

26,900. I am not talking about silver now. It is another question than the depreciation of silver?—Pardon me, I think it is very much to the point, because if you displace silver, gold will have to take the place of silver. I do not think we are at the end of the demonetisation of silver; we are still in a transition period. Then as regards the African discoveries, I think they are very nearly balanced by the diminution in the use of silver in the States, owing to the cessation of the coinage under the Sherman Act; the United States will now become demanders of gold.

26,901. I think you allege one of the reasons for the depreciation, especially in the early years after 1873, was the fact that Germany and some other countries demonetised their silver and had to fill up the vacuum with gold; and also that other countries, especially Russia, made very considerable war chests and accumulations of gold for the purposes of war?—Yes.

Prof. H. S. Foxwell. 29 June 1894.

26,902. Those operations have been to a large extent completed, and in the interval the output of gold has considerably increased?—Yes.

26,903. At the same time, in consequence of the depreciation of prices, the same amount of gold must go very much further in the mercantile operations of the world than formerly?—Yes.

26,904. Having regard to all those facts, do you think there is likely to be a still further considerable depreciation in prices and appreciation in gold?—I think so, on the average; possibly for the next two or three years, there might be a slight recovery; but I do not think it likely. I notice that during every month this year the appreciation has continued, and that it has been greater this year than in almost any previous year.

26,905. Still I must call your attention again to the fact that in the last nine years, as I think you have admitted, there has been fair stability?—Yes; I see nothing remarkable in the stability of the last nine years.

26,906. The ups and downs have not been considerable?—Not very considerable.

26,907. Looking to that fact and to the other facts that I have called your attention to, do you think there is likely to be a further appreciation of gold?—I think so; and I found that opinion mainly upon the geological opinion which has been very widely expressed, that the tendency is to a scarcity of the metal gold; and, further, that the demand for the Arts is very steadily increasing, and shows every likelihood of increasing; so that I have heard it estimated that in a short time the whole of the supply of gold will be required for the Arts alone.

26,908. It is founded, then, mainly upon a geological opinion that the output of gold will not continue?—It is never likely to be very large for any considerable period of years together.

26,909. Still it has increased considerably in the last few years?—Yes, and it will from time to time.

Output of gold.

26,910. Still it has increased considerably in the last few years?—What is stated is that the discoveries of gold are not lasting, and that they are soon worked out.

26,911. (*Mr. Giffen.*) Is not the Transvaal a new discovery of a remarkable kind?—Yes.

26,912. Not subject to those geological conditions which apply to alluvial gold?—Not to the same conditions; I admit that it is a more steady production, on the whole.

26,913. (*Chairman.*) I think I am right in saying that the alluvial gold generally is worked out?—Yes.

26,914. And that what we have been depending upon of late years has been the quartz formations?—Yes.

26,915. And formations such as those which exist in the Transvaal, which are of a different character?—Yes.

26,916. But from whatever cause, the output of gold has steadily increased during the last few years?—Yes, steadily.

26,917. Is there not reason to suppose that it would be rather increased than diminished if fresh capital is applied to these mines in the Transvaal?—Yes; but you must set against that the new demands that will arise for gold if this demonetisation of silver is persisted in, because we cannot tell where we are. We have had masses of silver floating at a perfectly nominal value, unjustified by the market value of the metal, and it is impossible to suppose that this state of things will continue for any long period. We may have a gold standard in India, for instance.

26,918. I ask you to consider the question apart from the question of silver?—I cannot consider the question apart from the question of silver.

Demand for gold.

26,919. The appreciation of gold must mainly have reference to its known proportion to other commodities?—But surely it is a question of the demand for

Prof. H. S. Foxwell.

29 June 1894.

gold at least as much as the supply of gold; if you demonetise silver you increase the demand for gold.

26,920. What other countries are there which are likely to demonetise silver?—I think that very likely we shall have a gold standard in India if the present state of things continues.

26,921. At all events it has not got one at present?—Not at present. It would be very difficult to know what the Government intended.

26,922. Does that form an important element——?—It would be an element.

26,923. In your prediction of what is likely to occur?—Yes, I think it would cause an enormous demand for gold.

26,924. But assuming that the gold standard is not to be introduced into India, you still think that gold is likely to be appreciated?—I think the present situation in India is impossible; it is not a permanent position at all; it must end one way or the other; we must either have the mints opened, or we must have a gold standard there.

26,925. Assuming a gold standard is not to be adopted in India, do you then consider that there would be likely to be an appreciation of gold in the future?—I think there would then be a great demand for gold from the United States in the long run.

26,926. In the long run?—Yes.

26,927. I think you have said that there is a scramble for gold at the present time?—There was certainly in 1892.

26,928. Does the present condition of the Bank of England show that there is anything like a scramble for gold going on at the present moment?—Not just now; but only very lately, that is in 1892, gold was selling at a premium of 5*d.* on the ounce, that is at 3*l.* 18*s.* 2*d.*; there was certainly a scramble at that time, and I take it that this is a temporary stagnation, to a large extent.

26,929. I presume that you would attribute some importance, or considerable importance, to the fact that the depreciation of prices has economised the use of gold?—Yes, undoubtedly.

26,930. If you are right in saying that 2*l.* goes to the extent that 3*l.* did some years ago, there must have been a considerable economy in the use of gold?—I think we could do without gold altogether, if we were content to let prices run down to the proportionate rate. It is entirely a question of the level of prices; I admit that entirely.

Continuation of the fall in prices.

26,931. Looking at the general course of prices do you consider that they are likely to go much lower?—I really do not feel that my opinion is worth very much—but I give it just for what it is worth—my view would be that although we might have, perhaps, a slight recovery of prices, that may always happen under the influence of speculative activity.

26,932. I think you said your main object is to cause stability?—Yes. I was going to say that although we might have a speculative movement—and we may always have a speculative movement for two or three years, apropos of some favourable circumstance—I think, looking at the conditions of the production of gold, in the long run, judging from the best evidence I can find, geological evidence, and so on, and looking at the probable increased demand for gold, due to the increase in the population, and the opening up of new countries, and so forth, that the supply of gold will certainly not be adequate to maintain the present level of prices, and therefore prices must fall.

26,933. (*Mr. Chaplin.*) Must continue to fall?—I think so.

26,934. (*Chairman.*) For the same reason that you think a fall in prices in the past has been disadvantageous to this country, so you think it will be damaging in the future?—Undoubtedly.

26,935. And you think it worth while to risk all the possibilities which may occur from a change of the monetary system for the purpose of preventing that?—The risk seems to me very small provided the agreement were substantial.

26,936. You think the risks are small?—I think so.

26,937. You think they may be encountered without fear or alarm?—They are nothing like the risks which followed on the demonetisation of silver in 1873—nothing comparable to that in any way I should say.

Prof. H. S. Foxwell.

29 June 1894.

Movements in wages and prices compared.

26,938. (*Mr. Channing.*) Would you admit that wages would rise more slowly than the prices of the commodities which the workmen would buy?—I should in some trades; I think in some of the less intelligent and less organised trades, I daresay in agricultural labour; but I should not with regard to the higher organised trades, where the unions are very effective, and know perfectly well what is going on, and would instantly get a corresponding rise of wages.

26,939. You depend, for bringing wages up to the proper ratio to prices, upon the combinations of workmen, and causes of that kind, and not upon economic causes?—In the long run competition would do it, but it might be delayed if it was left to competition. I think under the system of organised trades, which we have now, the rise would be instantaneous, because these unions reckon up the masters' profits to a nicety, and know perfectly well what the situation is, and instantly demand, and generally instantly receive, a correlative rise.

Objects of bimetalism.

26,940. (*Mr. Everett.*) I understand you generally to wish for a unity of gold and silver money, so that through the world 1*l.* and 20*s.*, to use colloquial language, should be of equal value?—Yes, there should be a fixed value between silver and gold throughout the monetary world.

26,941. So that it would make them practically one money, instead of two moneys constantly diverging?—Yes.

26,942. And your opinion is, that the joint user of the two would preserve a greater stability of values?—Yes.

Effect of cheap imports.

26,943. Then with regard to our buying what we import so very much cheaper than we did, has that not tended to the impoverishment of the nations who supply us?—That is so with the farmers of America and Australia, and it would to some extent be true of the farmers of the gold standard countries, but not in the same degree of the farmers in silver or paper countries.

26,944. I was referring to the gold standard countries. Is it not a fact that since the fall in prices, all the gold standard countries, which are not our own colonies, have been building up a wall of customs duties against us, and so been trying to recompense their own producers for the fall in prices which they have suffered by?—Yes, exactly parallel to what took place after 1815, when there was a great revival of protection in the same way.

Effect of appreciation of gold on real property.

26,945. The effect of that has been to close their markets against us?—Yes.

26,946. Then I should like also to ask you whether there has not been a prodigious depreciation in the value of property at home in our landed property, our mill property and our mining property; taking property as a whole, has there not been a depreciation measured either by hundreds of millions, or thousands of millions, probably in the value of things at home?—It would be certainly a very large depreciation corresponding to the fall in gold.

26,947. That which has benefitted us by the greater value of the gold which our debtors have to pay us has been really morally very unjust and onerous to them, has it not?—I should have supposed so.

26,948. And if the greater rate of their debts has really been brought about by legislation, does there not seem to be an element of very great wrong in it?—I have always thought that a Government should concern itself, as far as lay within its power, to maintain the stability of the standard.

26,949. It has not been from an alteration really in the production of the precious metals out of the earth, but an alteration by legislation affecting the use of them, that has caused this?—Yes, in my opinion.

Labour and the fall in prices.

26,950. The general drift of the examination by the Chairman was to the effect that the fall in prices has been on the whole, advantageous to labour, and we know that that fall in prices has occasioned a long depression in trade, and an injury to a great many employers. Would not that very much look to lead to the curious statement that long depression of trade and the ruin of employers is beneficial to the people who work for them, that is, that the labourers thrive upon the ruins of their employers?—Yes, I have put it in this way, that anything that tends to contract production, or to make production less than it otherwise would be,

Prof. H. S. Foxwell.

29 June 1894.

His experience on the question of bimetallism.

must necessarily, in the long run, be disadvantageous to all classes.

26,951. (*Mr. Lambert.*) How long have you studied this question?—The question of bi-metallism?

26,952. No, the whole currency question, or the economical question?—I have studied economics continuously for 25 years.

26,953. How long ago did you become a bi-metallist?—I can hardly say, it was very gradual. The bi-metallic theory was explained to me by Professor Jevons as a very interesting example of his contributions to the theory of value. The point was that Professor Jevons had brought into prominence the importance of demand, and as soon as you realise the importance of demand for money, the important effect that has upon its value, you are half way towards bi-metallism directly.

26,954. When did you become a believer in bi-metallism?—I did not commit myself to a public expression of opinion on the subject until after the Commission had reported, for this reason, that although I was gradually tending in that direction, I felt that there might be arguments on the other side—economic questions are always so complicated—and I was reluctant to express a positive public opinion on bi-metallism until I had heard all that could be said on the other side before the Commission of 1886. But I am bound to say that the impression which was left on my mind was that the case against bi-metallism, as represented by that Commission, was unexpectedly weak, and I had no hesitation after that in joining my friend Professor Nicholson in publicly advocating it.

26,955. Then it was about eight years ago that you became a bi-metallist?—Yes, about eight years ago I was prepared publicly to express myself as of that opinion.

26,956. So it took you 17 years' study to become a bi-metallist?—I could hardly say that, because the question was not controverted in England until 1876, and at that time I had not looked very closely into the monetary question; I was more interested in the wages question at that time.

26,957. How long study do you consider a man should give to this subject before he would be competent to form an opinion on it?—It depends altogether on the person.

26,958. Take a man of ordinary intelligence?—I do not know whether one can answer a question of that kind, but I think six months' study, at all events, would be ample.

26,959. Supposing this Commission to report in favour of, or against, bi-metallism, would it shake your opinion in any way?—I think that question puts me in a very unfair position in the presence of the Commission. I am bound to say that I do not think anything could shake my opinion now; I think nothing but new facts, or new arguments, would shake my opinion; no statement of opinion would shake it.

Landlords and the appreciation of gold.

26,960. You say gold has appreciated 50 per cent.?—Yes.

26,961. I presume that you will take it from me that the rents in this country have depreciated about 40 per cent.?—Yes.

26,962. Do you think that this system of bi-metallism would benefit the landed interest?—I do not see that there can be any question of it at all.

26,963. Gold has appreciated 50 per cent.?—Yes.

26,964. Rents have depreciated 40 per cent.?—Yes.

26,965. Rents are paid in gold?—Yes.

26,966. Gold has appreciated 50 per cent.?—Yes.

26,967. And rents having depreciated 40 per cent., landlords, or the receivers of rent, are in a better position by 10 per cent. than they were 20 years ago?—Yes, that would be so, except this, that the value of a great many of the things which they buy with their rent has not depreciated in the same degree as the value of commodities.

26,968. Take the general question that gold has appreciated 50 per cent.?—Quite so.

26,969. Therefore landowners, according to your theory, of course I do not speak disrespectfully of it in the slightest degree, are in a better position by 10 per cent. upon their rent than they were 20 years ago?—I should put it this way, that their rent is worth, we will say, 10 per cent. more, measured in commodities than it was, that is, if your figures are right, and I accept them from you. This is not a question of theory, it is a question of facts. Perhaps I might say that rates and taxes, of course, have not diminished in the same proportion.

Prof. H. S. Foxwell.

29 June 1894.

26,970. My point is this: the purchasing power of the man's income has increased if gold has appreciated?—That would be a question of net income, would it not, not of his gross income in rents from his estates. I should like to set against that the outlay upon the estates, which has been much larger of late years, as far as my experience would go.

26,971. Basing it upon a broad general ground, it would appear, according to your theory, that landlords, as rent receivers, are better off by 10 per cent. than they were 20 years ago?—I do not know why you say "my theory," it is solely a question of fact.

26,972. I mean basing it upon the statement that gold has appreciated 50 per cent.?—Yes.

Effect of bimetallism on production of gold.

26,973. Would your legislation tend to make gold scarcer?—More plentiful, but less in demand so far as it goes.

26,974. Would it not also lessen the production?—That might be the ultimate effect, slowly. The first effect would be that you would have practically available the whole mass of silver on equal terms with the gold, and that would tend to make gold, for the time, very much more plentiful.

26,975. Would the ultimate effect be to make gold more plentiful?—Yes, in this way, because you would have access to the supply of silver for all the monetary purposes for which gold is now required, and therefore the production of silver being likely to be more plentiful, that would be the same thing as if the production of gold became more plentiful.

26,976. Have we not as much silver as we can use now?—Not in the way we propose to use it. I do not know that I have quite brought out that point; it is very important as clearing up a question between Mr. Giffen and myself. When Mr. Giffen speaks of the use of silver, I think he as often as not means coins, but I do not think for a moment that we should use more silver in that way. We should use silver to an unlimited extent in the way I have suggested, by purchasing it for reserves against the ordinary forms of currency—namely cheques and notes.

26,977. If you lowered the price of gold the natural effect would be to limit production?—Yes, so far.

26,978. That would tend to make it scarcer?—Yes.

26,979. Less gold in the world?—Less gold in the world.

26,980. Do you think that Government can by legislation overcome this natural law, that when you make an article scarce it becomes dear, and when you make an article plentiful it becomes cheap?—Yes, here, because this is a question of substitution. In the circumstances proposed it would be possible to substitute 20 ounces of silver for one ounce of gold, for all monetary purposes.

26,981. Do you think it is possible to make water flow against a stream—against a natural law?—Not as a rule.

26,982. Is it not also a natural law that scarcity produces high prices?—Yes. I think perhaps there is a little confusion, or at least the matter may be put in this way:—gold may be scarce, absolutely in the sense that there is not so much existing, but it may be scarce in another sense, that although there is a great deal of it existing, there is not so much as is wanted. In the conditions that you and I are assuming now, there would not be so much gold wanted, and there would not be so much gold produced, but there is no reason to suppose that gold would be scarcer in the sense of its value being greater; the demand would be diminished in a greater proportion than the diminution of the supply, or at all events in an equal proportion.

26,983. If you by legislation propose to make the Government, through the Mint, give *1s.* for *9d.*, according to the market value of silver, who is to bear that margin of *3d.* between the two?—We do not propose to do anything of the kind, because we do not assume for a moment the possibility of such a difference between the market value and the mint value as long as the Mint is open. How can the market value sink

Prof. H. S. Foxwell.

29 June 1894.

below the mint value at the time the Mint is open to purchase unlimited quantities?

Course of prices since 1873.

26,984. (*Mr. Chaplin.*) The chairman submitted to you a chart, from which he pointed out that there had been greater stability in prices during the last nine years?—Yes.

26,985. That chart also showed, I think, that since 1873 there had been an unprecedented and almost continuous fall in prices, of between 40 and 50 per cent.?—Yes.

26,986. You admitted that there was a rise in 1890 and 1891; was I right in understanding that that could be accounted for by the fact of the American legislation in support of silver which was passed at that time, or about that time?—I think that gave a general stimulus to speculation, and that the two together produced an inflation about that time.

Condition of labourers.

26,987. When it is suggested to you that labour has not been affected as you would think it would have been if the effects of the abandonment of bimetallism were such as you describe, you say that there are a hundred other circumstances affecting labour favourably, and quite sufficient to account for the fact that labour has improved its position, and that the wages of labour have risen?—Yes.

26,988. Would you name some of those very quickly without going into details?—I do not think I could very quickly. We all remember that the condition of the people question was only raised about the middle of the century by Kingsley and Carlyle, by whom public attention was attracted in a degree in which it never had been before, to the question of the condition of the working classes, and efforts on all sides were made to improve that condition. It is very difficult to single out anything in particular, because the whole tendency of social legislation and of public opinion since that time has been to improve the position of labour. I think that amongst the things may be mentioned trades unions, clubs, and benefit societies, savings banks, co-operative stores, national education, increased emigration, the greater ease of moving from place to place, better information as to the state of the labour market, and better dwellings and allotments.

26,989. Then a vast number of circumstances have occurred, quite sufficient in your opinion to account for the fact that the wages of labour have increased, and the position of labour has improved, in spite of what you consider to be the disadvantages arising from the monetary charges?—Yes, that is my view.

Diminution of pauperism.

26,990. With regard to the chart showing a diminution in pauperism, have you had any opportunity of studying it?—Not very closely; I have not seen it before to-day.

26,991. Do you know where it was prepared, or by whom?—I do not.

26,992. (*Mr. Dalton.*) Will you take it from me that the figures from which the chart was prepared were taken from the last annual report of the Local Government Board, and that Mr. Crawford, the Assistant Secretary of this Commission, has examined it, and that, so far as we can ascertain, it is accurate?—Yes, I will take that.

26,993. (*Mr. Chaplin.*) The chart, however, shows just as great a diminution of pauperism with rising prices prior to 1873 as it does with falling prices since then?—It rather bears out the argument that I was laying before the Commission just now, that the general diminution in pauperism is part of the general progress of civilisation which has been going on continually over the whole period.

26,994. (*Mr. Dalton.*) As to the first few years, when pauperism fell very much, although the prices were rising, they were years comparatively near to the passing of the new poor law, were they not?—Yes, they were.

26,995. I think that administration affected pauperism to a greater extent during those years than it has since; the Out-door Relief Regulation Order, I think, was issued in 1852, and certainly there has been less out-door relief given to able-bodied paupers since that date?—I understood that the whole principle of the Commission of 1834 was against out-door relief, even more strongly at the outset than afterwards.

26,996. For able-bodied paupers?—Yes.

26,997. More and more stringent regulations were made, terminating in the Out-door Relief, Prohibitory, and Regulation Orders under the Poor Law for the repression of able-bodied out-door relief to able-bodied paupers. The last of these orders was made in 1852; I think that a greater change was taking place in the administration of poor law relief during those years than has been taking place in the last 20 years?—I do not like to put my recollection against your knowledge, but I really thought that the Poor Law administration was more severe at first just after the Amendment Act of 1834, and that subsequently it was rather relaxed.

Prof. H. S. Foxwell.

29 June 1894.

26,998. (*Mr. Chaplin.*) In view of the fact that it shows just as great a diminution of pauperism with rising prices as it does with falling prices, on general grounds, I suppose, you would not attach any special importance to this chart as bearing on the question of a rise or fall in prices due to monetary causes?—I may say that, as a matter of fact, it was exactly the chart which I expected to find; I expected to find a practically continuous diminution of pauperism over the whole period from 1850.

26,999. (*Mr. Dalton.*) It goes up in the Cotton Famine year—in the same year when the prices go up, and it follows rather closely the line of prices in the year 1859?—That would mean that the commercial crises of those years brought about a little pauperism—in the years immediately after the crisis of 1857.

Evidence of results of monetary difficulties.

27,000. (*Mr. Chaplin.*) You were asked by the Chairman if you could show to the Commission any facts evidencing the serious results of monetary difficulties, and you referred, I understand, in reply to that, to the facts disclosed by the Commission on the Depression of Trade?—Yes.

27,001. Would you include agricultural depression, which is notorious as one of the facts confirming your views?—Certainly.

27,002. I suppose the very fact of the appointment of this Commission would give support to your statements?—I should have thought so. We might go a little further and include financial depression now; the depression is almost as severe in the City, on the Stock Exchange.

27,003. It is the fact, I believe, is it not, and within your knowledge, that whatever may have been the improvement in the condition of agricultural labourers throughout the country, there has been on the whole a great diminution in the amount of agricultural employment?—Yes. Perhaps I ought to say there that I think it is only fair to admit that we should have expected some diminution in consequence of the improvement of machinery, and the introduction of labour-saving machinery.

Trades unions and bimetallism.

27,004. Did I understand you to say that the opinions you have expressed on this subject are shared by the Parliamentary Committee of the Trades Unions?—They certainly passed a resolution calling upon the Government to take steps to bring about the adoption of international bimetallism. That resolution was taken after a debate on the question of some eight hours.

27,005. (*Mr. Giffen.*) Had they all given the six months which you consider expedient to the study of the question?—Some of them have given six years, and more. Their own paper, the "Cotton Factory Times," is very ably served with articles on the monetary question, and has been for many years, many of them written by the workmen themselves, but some of them by experts.

27,006-7. (*Mr. Chaplin.*) Did the gentlemen who expressed these views at the Parliamentary Committee of the Trades Unions speak as the representatives of labour in the north of England?—I think it is generally known how far they represent labour. I always understood that they were the most important representation of labour from a parliamentary point of view.

27,008. Then may I take it from you that these representatives of labour, being a very important body, regard the result of the monetary changes which we have been discussing here as most injurious to their interests?—I think so. Of course they have taken it to some extent upon trust; they have taken it upon the opinions of those of their number who have gone into the question very fully indeed; who have weight with them, and in whom they have confidence, and who have explained to them in some degree the general outlines of the question.

27,009. When you speak of the members of the trades unions who have really examined into this question,

Prof. H. S. Foxwell. 29 June 1894.

and whose opinions they have taken upon trust, are you able to say from your own knowledge whether they are men of ability?—Yes.

27,010. Who have really given to the subject adequate study and attention?—They are men who are able to make very effective speeches on the subject, and very able speeches.

27,011. Who give you the impression of having mastered the question?—I do not mean to say that they would master the details about the agio and the seignorage, and matters of that kind, but they certainly thoroughly appreciate the broad outlines of the question, and the way in which it affects Lancashire industries, which is the point which naturally interests them most.

27,012. They would not stand cross-examination by Mr. Giffen, but for all other intents and purposes they are well acquainted with the subject?—I think they would be able to give a very good account of their views.

Effect of appreciation of gold on debts due to the country.

27,013. The Chairman referred to the fact of this country being the great creditor country, and he asked you whether it was not an advantage to the country being in that position that the 100,000,000*l.* of debt per annum has appreciated in value, and I think you replied to the effect that that was not so, because you were apprehensive of a constant and continuous fall in prices?—I think the answer I gave was practically this, that the appreciation in the weight of those debts, the increase in the weight of those debts, was injurious to the debtor countries; that it obstructed their development; that it prevented the further investment of English capital in those countries, and that in many cases, all over the world, it has led to repudiation and bankruptcy on their part, and that on the whole we do not benefit by any unjust increase—any arbitrary increase—brought about by currency movements of that kind, of the debts owed to us by our debtors.

27,014. Do you think that if by the effects of a constant and continued fall in prices we continually increased the burden of that debt to them, it may become so great that ultimately they may not be able to discharge their debt at all?—That has been the case in many instances.

27,015. And you are apprehensive that that may continue in a greater degree in the future?—I should hardly say a greater degree, because, as I understand it, further investment in these countries has almost ceased.

27,016. With regard to these investments which have been already made, you are apprehensive that they may be in greater danger in the future than they are at present?—The difficulties would increase certainly.

27,017. Many investments have been made by this country, for instance, in American railroads, is not that the case?—Yes.

27,018. And to a large amount?—Yes.

27,019. Is it not the fact that a large proportion of the American railroads, one-third of them, are now said to be in the receiver's hands?—Yes, it is so.

27,020. Do you know anything upon the subject of land mortgages in America, in which a great deal of English capital is invested?—I have taken the figures out; they are just returned by the census. I cannot speak very well from memory, but I think something like 20 per cent. of the value of those properties is mortgaged over the whole of the States. I have the return here.

27,021. In fact, although it may at first sight appear to be greatly to the advantage of the creditor country that the material or commodity in which the debtor countries are bound to pay their debts to it should greatly increase in value, there is this other side to the question, that it may lead to the losing of the investments altogether?—Yes.

27,022. And that has been shown already to some extent by bankruptcies and repudiations in different countries?—Yes.

Objects of bimetallism.

27,023. With regard to what you said to the Chairman as to your chief objects, namely, that the first object was to check the fall in prices, and the second to get the greatest available stability in the standard, you replied in answer to him, that the ratio which you had suggested was 20 to 1, but you are not in any way, I understand, committed to that specific ratio, are you?—I explained that it was merely my personal opinion on the facts now before me.

27,024. Then you were asked this question: who was to decide as to what the ratio should be; surely that would be as a matter for the different nations to settle among themselves when the matter came to be seriously considered?—Yes, I suppose so.

Prof. H. S. Foxwell. 29 June 1894.

Determination of the ratio.

27,025. It is not a matter upon which any one nation could take a decision without the consent of the others?—Clearly not.

27,026. Are you of opinion, once it had been found possible to establish a ratio, that it should be altered from time to time, or that it should be left so arranged that there would be possibilities of altering it from time to time if the necessity arose?—I certainly should not contemplate a constant alteration in the ratio; that would be intolerable; but no one can say that some convulsion in the circumstances of the production of the metals might not make it desirable to modify the ratio at the end of a century, perhaps, or at the end of half a century.

27,027. (*Mr. Giffen.*) Or at the end of a quarter of a century?—For instance, there might be the absolute cessation of any production of gold; supposing circumstances of that kind came about it might not be worth while to keep up a system which was nominally a gold and silver system.

27,028. (*Mr. Chaplin.*) I suppose the fact that it had been found possible, if it were found possible, to establish and maintain a ratio on one occasion would lead to the belief that if it was desirable and necessary it would be equally possible to alter that ratio?—Certainly; and I should say we should not start upon an operation of this kind having in prospect a further adjustment; we should leave the possibilities of the future to the future.

Effect of a ratio of 1 to 1.

27,029. You will understand that I have put these questions to you at the request of another member of the Commission. I want to ask you now a question upon a suggestion made to you by Mr. Giffen in his cross-examination. He said, why not make the ratio 1 to 1? Is not the answer to that proposal conclusive, that it would lead to such an enormous rise in prices?—I should have thought so.

Estimated weight of gold and silver in existence.

27,030. Can you tell me what the estimated weight of silver in the world and the estimated weight of the gold in the world, very roughly, is, it does not matter how roughly?—This is an estimate made by Mr. Hucks Gibbs. He estimates the stocks of money by weight to be, silver 3,480 million ounces; gold, 226 million ounces. Now if you calculate those at the rate of 15½ to 1 they come out, silver, 870 millions; gold, 880 millions. Those are substantially Soetbeer's figures.

27,031. I am very slow at making calculations; can you tell me how many times the weight of gold is the weight of silver?—It is the other way; the weight of silver is almost exactly 15½ times the weight of gold, as you will see from those figures that I have given, 870 millions and 880 millions. There is just that difference.

Effect of a ratio of 1 to 1.

27,032. Then the effect of making the ratio 1 to 1 would be precisely the same as if you added to the gold in existence by about 15½ times more?—Yes.

27,033. I think it is a fact, is it not, that when the great gold discoveries occurred about 40 years ago, in the course of a comparatively short number of years they practically doubled the amount of gold in existence?—I could not say, speaking from memory. I do not know. I think it would probably be quite as much as that.

27,034. That increase had the effect of raising prices something like 40 per cent. or 50 per cent., or, at all events, was followed by a rise in prices?—By a very considerable rise.

27,035. Whatever it was, something like 40 per cent., was it not?—Yes, something like 40 per cent., but not quite that. You might say 30 per cent., roughly.

27,036. Then the effect of adopting any suggestion of that kind would have been to multiply the gold by 15½ times, and consequently to raise the prices of commodities?—I would rather put it the other way; multiply the silver by 15½, which would be increasing the value of the silver 15½ times.

27,037. It would mean, of course, a fabulous rise of prices?—It would create a rise of prices which would ultimately result in lowering the real value of silver, as well as of gold, and so checking the supply of both metals.

Prof. H. S. Foxwell.

29 June 1894.

27,038. At all events it would create such a rise in prices that no one could dream of such a ratio as that?—Of course the adjustment of the ratio is entirely a question of the effect on prices.

Bimetallism and past and future contracts.

27,039. It is not a practical proposition. Now with regard to the question of contracts you were asked whether it would not be very unfair by the changes which you propose to affect contracts which had been made in the past. Is it not the case that contracts were all altered in the same way by legislation passed in the year 1816?—Yes, they were no doubt seriously altered by the return to cash payments then enacted.

27,040. Contracts have also been altered in every country in Europe in the same way where these monetary changes have been recently made?—Yes, undoubtedly.

27,041. Is it not the acknowledged right of any country to choose for its standard whatever appears to be best suited to the general interests of the community?—Yes, I understand that the regulation of the standard has always been considered to be a matter for Government control and State adjustment.

27,042. And even if these contracts were altered in the mode in which the chairman indicated, I think, as being probably unfair and injurious, even then I understand that people with contracts made since 1873 would only be placed in precisely the same position as that which is occupied now by the people who made contracts prior to 1873?—Exactly.

27,043. Of course contracts of that description are altered and affected by any additions whatever to the standard metal of the country?—If you mean any alterations in the production of the metals, in the supply of the metals, certainly.

27,044. Yes, I mean in the additions; for instance, contracts would equally be altered by any large additional discoveries of gold?—Certainly.

27,045. But no objections are taken to that, I understand?—Apparently not.

Indian monetary legislation.

27,046. Some questions were raised as to the probability of there being an increasing appreciation of gold, and the question was asked with regard to India, was it not authoritatively stated that the object of the recent legislation in India, by closing the Mints, was to establish a gold staudard?—Yes, I think undoubtedly the establishment of a gold standard was the object.

27,047. That was authoritatively stated, I think?—Yes.

27,048. Then we have no ground for assuming at present that the Government are likely to revoke that proposition, and thereby to give us any hopes that the appreciation of gold may discontinue?—No. As it is the doubt would arise as to whether they could maintain a gold standard without a gold currency or without any considerable reserve of gold.

27,049. The chairman was rather asking you questions which appeared to me to indicate the opinion that there probably might be a cessation of this appreciation in the future?—Yes.

27,050. Are you of opinion that that is likely to occur from anything that you can foresee as likely to happen in India within the next few years or not?—Certainly not from anything that is likely to happen in India; there can be no question of that.

27,051. Unless the Government revoke altogether the legislation that they have quite recently carried?—Yes, unless the legislation fails in some way or breaks down.

Effect of increased prices of gold and silver on production of those metals.

27,052. I wanted to ask you a question with reference to something else Mr. Giffen put to you. He asked you this question: Would not the increased price of silver greatly increase the production of that commodity? The question I want to ask you is this: Is it not the case that the production of the metals does not by any means altogether depend upon the prices which they command?—Yes.

27,053. Does it not depend to a great extent on the accidents of discovery and on the gambling instincts of mankind?—Yes.

27,054. Are you aware that evidence was given before the Gold and Silver Commission to this effect, that all the gold and silver in existence in the world at the present time was estimated to have cost in production a great deal more than it is actually worth?—There is no doubt whatever about that; it was pointed out by Jevons long ago from his personal experience in Australia, even at the most flourishing time, that on the average each miner did not produce more than half as much gold as his wages cost.

Prof. H. S. Foxwell.

29 June 1894.

27,055. And it does not therefore follow that an increased price for either of these metals would necessarily increase the production?—It does not follow. One would of course expect some influence of that kind. But I did point out in regard to silver that in the period from 1810 to 1830 the value of silver rose very considerably owing to the fall of prices, but the production of silver fell off from 7·7 millions a year to 3·6 millions. Of course there were explanations of that.

27,056. (*Mr. Giffen.*) That was the revolutionary period in South America, was it not?—That would have some effect, but I do not think that would cover all the period. It would not cover the period down to the end of 1830, I think, but even if you take the period of 1849, when the fall had been in progress for 40 years, then the production of silver was only exactly the same as it was at the beginning of the century, 7·8, as against 7·7. It is very much a matter of accident.

Changes in standard in money.

27,057. (*Mr. Chaplin.*) It has been stated in evidence this afternoon that the Government of this country has made no changes in prices by alterations in its standard money, but it is the fact, I think, that the Government of this country has made changes in India which have undoubtedly had that effect, and that it has made them quite recently?—Yes, and if you go back to 1816 you will find that there was a distinct change made then in the standard money.

27,058. When the mints in India were quite recently closed one of the avowed objects of that policy, I think I am right in saying, was to give a scarcity value to the rupee?—Yes.

27,059. That is your distinct recollection as well as mine?—Yes, I think so.

27,060. As a matter of fact it is the case, I think, that it has given the rupee a greater value than it would have had at the present price of silver if the mints had remained open?—At the present price of silver, undoubtedly

27,061. And so far it has affected prices?—Yes, inland prices.

27,062. Then, as a matter of fact, the very thing in principle has been done by this Government, which it was suggested would follow upon your proposals if they were adopted by them?—Yes, and with the same object, namely, to maintain stability of prices.

Effect of bimetallism on past and future contracts.

27,063. It was then suggested that it would be a great injustice to enable a debtor to pay a debt in one metal which he had contracted to pay in another; do you see how, or in what way this would inflict an injustice upon him?—No, I do not. I have already said that if there had been a specific contract to pay in a particular metal it might be well not to interfere with specific contracts; but if it was a contract to pay in money of the realm I see no difficulty. As regards what has so often been said as to paying in the cheaper metal, there would be no payment in metal at all as I understand, but there would be payment in bank paper, notes and cheques, just as there is now. Nobody could say what metal the paper was based upon any more than a Frenchman can say when he pays his debts whether the note he pays them in is based on silver or on gold, it is based on 70 millions of gold and 50 millions of silver, but nobody can say he is tendering silver or he is tendering gold; he is simply tendering bank paper, that is, legal tender paper.

Function of precious metals under bimetallism.

27,064. Apart from that, what you would contend, I suppose is this, that if the bimetallic policy was adopted there could be no such thing as a cheaper or dearer metal, as the precious metals would always maintain their relative value, and each would perform all the functions of the other?—Yes.

27,065. (*Mr. Giffen.*) All the functions?—Well, not perhaps all, because token coin—the sixpence for instance—must be made of silver.

27,066. (*Mr. Dalton.*) But for purposes of the Arts?—And for purposes of the Arts; but we are speaking of the monetary functions, I understand.

27,067. (*Mr. Chaplin.*) Yes, of the monetary functions?—We should, of course, want a little gold for the heavier coins that we use, but if we had one-pound notes that would not matter very much; that would become a point of indifference to us. But supposing we had no

Prof. H. S. Foxwell.
29 June 1894.

one-pound notes, we should want gold for that purpose, just as we want silver for the sixpences. But as regards the great mass of the Bank reserve, it would matter nothing in which metal it was held.

27,068. (*Mr. Giffen.*) Do you state that from a banker's point of view?—Yes, I have had the opportunity of many conversations on that subject with directors of the Bank of England, and I think I may venture to say this, that no objection would be brought on the part of the Bank of England to any proposals of that sort—not by a majority of the directors at the least.

Law of legal tender.

27,069. (*Mr. Chaplin.*) Now I want to ask you one or two questions on the question of legal tender, and then upon the disputed point as to whether open mints do not create an unlimited demand for either metal. With regard to legal tender, that question is covered, I think, by the Coinage Act of 1870?—Yes.

27,070. Are you acquainted with Clause 6 of that Act? I should like, in order to have it upon the notes, to read it. Clause 6 runs: "Every contract, sale, "payment, bill, note, instrument of security for money, "and every transaction, dealing, matter, and thing "whatever relating to money, or involving the payment "of, or the liability to pay any money, which is made, "executed, or entered into, done, or had, shall be made, "executed, entered into, done, and had according to "the coins which are current and legal tender in pur- "suance of this Act, not otherwise, unless the same be "made, executed, entered into, done, or had according "to the currency of some British Possession or some "Foreign State." Now, I understand that it is under that Act that the law of legal tender is in existence, and is enforced at the present time?—Yes, but it is supplemented by the law of legal tender of bank notes in the Bank Charter Act of 1844.

27,071. When it is suggested that this very serious contingency might arise, that bankers or others might refuse to take silver, the answer, I assume, is this, is it not: that they are obliged to take it by the law, and that they would be obliged to do so by the law if either the silver metal or the gold metal is made legal tender?—Yes.

27,072. So that the difficulty arising from the possible contingency of the banks refusing to take silver is disposed of by that law?—Yes, I think so.

Open mints and demand for precious metals.

27,073. Now, with regard to the question of the unlimited demand not being created by the open mints, if I am rightly informed, this question is provided for by the Act of 1844, and also by the Coinage Act of 1870. The Act of 1870 provides as follows in Clause 8: "Where any person brings to the mint any gold bullion "such bullion shall be assayed, and coined, and "delivered out to such person, without any charge for "such assay or coining, or for waste in coinage." Is it not the case then, that, under this Act, any person finding the metal which is the legal tender of the country has the right to take it to the Mint, and having taken it to the Mint, they are obliged to return it to him coined?—Yes.

27,074. In that sense there is always an unlimited demand for the metal provided by this open mint, which does not depend in any degree upon the country, or its desire or its capacity to take it, but upon the wish of the person who has found it, and who chooses to take it to the Mint?—Yes, that is so.

27,075. Then with regard to the Act of 1844, are you acquainted with the provisions of Clause 4?—Yes.

27,076. They are as follows: "And be it enacted that "from and after the thirty-first day of August one "thousand eight hundred and forty-four all persons "shall be entitled to demand from the Issue Depart- "ment of the Bank of England Bank of England notes "in exchange for gold bullion at the rate of 3*l.* 17*s.* 9*d.* "per ounce of standard gold." You are acquainted with that?—Yes.

27,077. Does it not follow from that provision that any person preferring to have notes instead of the actual metal returned to him in the form of coin has the power of taking any quantity of bullion he pleases to the Bank of England and there receiving from them bank notes in exchange for it to any extent, quite irrespective of either the wish or the desire, or the capacity of the country to take it, but depending entirely upon his own will?—That is so.

27,078. In that sense is it not clearly established that the Mints, being open by law in the sense that I have described, do provide an unlimited market for any amount of either metal if those metals are referred to in this law?—I do not understand how it can be disputed that those clauses which have been read do provide an unlimited market.

Prof. H. S. Foxwell.
29 June 1894.

27,079. (*Mr. Giffen.*) But not a market, you get back what you take to the Mint—is that not the case? Gold is gold after it leaves the Mint as well as before?—It is legal tender when you get it back.

27,080. (*Mr. Chaplin.*) Having received in exchange for their bullion either bank notes or coin of the realm which is legal tender for debt, this is available, is it not, to those people for the discharge of whatever debts they may owe, or for the purchase of whatever commodities they may require?—Yes, that is so.

27,081. Is it not in that way that they go into circulation and increase and expand the volume of currency in the world?—Yes.

27,082. Is it not also the fact that in one sense this increased volume of currency creates the necessity for its own provision in this way: that the mere fact of a large addition of this kind to the currency of the world necessarily increases prices?—Yes, and might further stimulate trade and so cause an additional demand again, as happened in 1850.

27,083. Then it is an entire mistake to say that the demand for metals through the circumstances of open Mints is limited either by the taste, or the capacity, or the habits of the people, and that on the other hand the fact is this, that the quantity of that metal taken to the Mints depends entirely upon the persons who may be fortunate enough to find it and to be the possessors of it?—That is certainly my view.

Effect of bimetallism on demand for gold.

27,084. (*Mr. Dalton.*) I did not quite understand how bimetallism was to make gold more plentiful?—Did I use that expression exactly?

27,085. I took it down at the time?—Less scarce I should have said, because scarcity is a question of demand; it would lessen the demand for gold.

27,086. But would there not be the same demand for the arts as before?—Probably yes.

27,087. I think you calculate that that will very shortly take up the whole of the annual production?—Yes; it is not my calculation, but I believe it is an accurate calculation.

27,088. That is, supposing things go on as at present?—Yes.

27,089. But if there was a diminished production of gold, it would all be required for the arts at an earlier period?—Yes, that is so.

27,090. How is gold to become cheaper? It will be wanted for purposes of the arts, and I suppose a jeweller must give the market price for it, or he must discontinue his business?—You have 880 millions of it in existence already.

27,091. But there is an unwillingness to part with that now when the holders may get 33 ounces of silver for each ounce of gold; what inducement, therefore, would they have to part with it when they get 20 ounces of silver for each ounce; because I take it that that is what the result of bimetallism would be?—I do not understand what you mean by parting with it—who have it?

27,092. I understand a great quantity has been kept in reserve by the different Governments as bank reserves and for war purposes—in America, France, and Russia, and so on?—The difference is this; it would go to a slight agio, and they would wish to part with it in order to get this agio, which might be 1 per cent., or 2 per cent., and possibly 3 per cent., whereas they would get the silver without the agio in the circumstances you have assumed.

27,093. They are holding it all now?—Naturally, now.

27,094. For war purposes, and for one purpose and another?—Yes.

27,095. What reason is there to suppose that they will part with it then?—Because silver will be equally available for all monetary purposes under the new system.

27,096. But not so convenient?—There will be very little difference in the matter of convenience; it is a small matter. The cost of carriage is very little, if anything, more for silver than for gold, because it is a matter of *ad volorem*; it passes by its value, and not by its weight.

Prof. H. S. Foxwell.

29 June 1894.

27,097. Then you think by declaring this ratio you would reduce it to that value?—Yes, I think so, undoubtedly; it all hangs on that.

Explanation of climbing ratio.

27,098. I do not think we have had an explanation altogether of what the climbing ratio is. I think you referred to it in your answers to Mr. Giffen; what is it precisely?—It is a suggestion which has been made. It is that the mints of the contracting countries should undertake to buy silver at a rate to be increased by one-twentieth of one per cent. per week.

27,099. Per week?—Yes, per week.

27,100. It would be very soon over then?—One-twentieth per week would be very nearly 2½ per cent. per annum. The reason for making it 2½ per cent. is to prevent any speculation in silver with reference to the future rise in value. It would not be worth while to buy silver for the sake of a 2½ per cent. advance. That was a suggestion which was made by merchants in Manchester as one that would meet their purposes exactly.

27,101. How long would it take by that process to bring down the ratio from 34 to 1 to 20 to 1?—I have not worked it out, and I could not tell you.

27,102. Weeks or years?—Years, of course.

27,103. (*Mr. Giffen.*) Years?—Years, undoubtedly.

27,104. (*Mr. Dalton.*) Then the ratio would be varying from week to week?—Steadily; by an ascertainable amount.

27,105. Then, when this metal is taken to the Mint, when the silver is taken to the Mint to be coined, you get for it paper which is legal tender, at what ratio—at the ratio for the time being?—The note would be legal tender at any time for its face value; but the silver would be bought at the ratio for the time being established at the mints.

27,106. Varying from week to week?—Yes, varying from week to week.

27,107. Then every note that you had would be of a different value, would it not?—No.

27,108. If you pay in 5*l.* notes, would they be all of the same value?—The 5*l.* notes would be all of the same value, but, of course, the quantity of silver which could buy a 5*l.* note would alter from week to week; it would gradually diminish.

27,109. Then the value of a 5*l.* note would vary throughout the year?—No, not the value of the note once issued.

27,110. I understand it represents a certain amount of silver at one moment?—Yes.

27,111. Another amount at another moment, and so forth?—That is true; but it would be rated to gold. It would always be legal tender for 5*l.* It would always represent the same *value* of silver.

27,112. If a man took his bank note to the bank and insisted upon being paid in the metal, he would have a different amount for it from week to week; if he took several he would get a different number of bars of silver?—That might be subject to arrangement; it would depend upon what arrangement was made. The proposal is comparatively a new one and we have not had time yet to thoroughly work it out in detail.

27,113. I had not heard of this before, and I was trying to find out what it meant?—You might make an arrangement that he should be paid in bullion at the then rated value. I think it would have to be the then rated value at the time at which he presented the note.

Fall in gold value of silver.

27,114. I think in Part 2 of the Commissioners' Report they say that they consider the greater part of the fall in the gold value of silver has been due to causes affecting silver rather than to causes affecting gold?—Yes.

27,115. I think it is quite clear, from your evidence, that you would not agree with that?—I think that was entirely wrong.

27,116. They say that the first and the most obvious of these causes is the production of silver?—Pardon me, may I have the exact words again?

27,117. It is on page 79, paragraph 71: "The above "are reasons for thinking that the greater part of the "fall in the gold value of silver has been due to causes "affecting silver rather than to causes affecting gold"?—That might be interpreted in two ways. No doubt it is gold that has appreciated and silver that has remained stable, but the question is, what has caused the appreciation of gold, and no doubt when we come to that question the answer would be that it was the demonetisation of silver, and that is a cause affecting silver; so I really do not know exactly what the Commissioners meant by that sentence.

Prof. H. S. Foxwell.

29 June 1894.

27,118. They give a great number of causes, but they say the first and most obvious of these is the increase in the annual supply which has occurred during the period of the fall in the gold price of silver. Then they give the figures as to that on page 3 of their Report?—If they suggest that the fall in the value of silver is really due to the increased production of silver I should disagree with them.

Production of silver since 1851.

27,119. We have not had, I think, before us the figures as to the increased production of silver from 1851 to the present time?—Here they are on that paper. I think they have been mentioned (*handing table to the honourable Commissioner*).

27,120. It has increased, I believe, without intermission year by year has it not?—No.

27,121. Well, taking it in periods of five years?—Probably it would be so in periods of five years.

27,122. At page 3 of the Commission's Report they give the amount produced in kilogrammes as being 886,115 for the average production for the five years 1851 to 1855 inclusive, but when they came to the date of their Report for the five years 1881 to 1885 it was 2,861,709 kilogrammes?—Yes.

27,123. That was more than three times as much?—I do not follow; 140 per cent. is the usual estimate I have seen of the increase since 1873.

27,124. Those are the figures in the blue book. But the increase, as far as I can make out, since has been very much greater. I asked Mr. Crawford, the Assistant Secretary to this Commission, to work the figures out for me, and I find that the greatest increase has taken place since that date?—It has been rather more rapid, I think.

27,125. Is it not very strange that you have that very steady and continuous increase in the production, notwithstanding the fall in the value of silver?—It is rather; but I have always held that as regards the precious metals you could not rely on the production following the alteration in their value very closely.

27,126. This seems to point to the conclusion that silver is more plentiful at the present time—the production has continuously increased over a very considerable period?—You must remember this, that although you speak of the fall in the value of silver, silver will buy nearly as many commodities all over the period you have mentioned down to 1885, and that the value of silver in commodities has not fallen.

27,127. But since 1885 the production has increased still more rapidly?—Yes, down to 1893.

27,128. 1892 rather; the 1893 figures we have not got yet, I think?—Up to 1893 there was no substantial alteration in the real value of silver, and therefore there is no particular reason why the production should have fallen off.

27,129. At any rate there was nothing to stimulate the production of it. The production has increased notwithstanding that gold was becoming scarcer and silver more plentiful?—Yes, and I think that is likely to be the case generally, and I think that is my principal reason for desiring to see the bi-metallic tie re-established.

Effect of increased production of silver on the ratio.

27,130. Does that not make it much more difficult to maintain the bi-metallic tie?—I do not see that. It is my principal reason for desiring to see that tie re-established, because I think it is only by associating silver with gold that we shall have an adequate supply of money. You suggest that gold might go out of circulation altogether perhaps.

27,131. No; I am suggesting that if it is becoming scarcer every year, it is difficult to see how the price can permanently be kept down?—I think it is barely possible that gold might go permanently out of circulation, but then if so it would be in such a case that if we were relying on gold simply, the commercial operations of the country would be practically arrested.

27,132. I was rather thinking of its market value for the purposes of the arts. How is it to fall when in this way there will be a possibly increased demand for it?—Possibly, yes.

Prof. H. S. Foxwell.
29 June 1894.

27,133. And there would be less to meet this demand, except this gold which is at present stored up in reserves?—Yes.

27,134. Your idea is that those reserves will be broken up, and that gold will be sent away for silver?—It is quite conceivable; I think that we might come to a silver standard ultimately, but I see no harm in it On the other hand, in the conditions which you suppose, conditions which assume the total absorption of the gold by the arts, I want to know what would become of the gold standard.

27,135. I am thinking of the annual production?—Yes, of the annual production.

27,136. I understood from you that we were approaching that stage?—I am told that it is so.

27,137. Then if we are approaching that stage, the time will come when the annual production is all required for the purposes of the arts independently of monetary purposes?—Then in that case under a bi-metallic system we should be upon a silver reserve, and I want to know in what position you would be under a gold system in that case?

27,138. What I want to know is what becomes then of the market value of the gold?—In that case as soon as ever gold was driven out of circulation the market value would cease to be under any control whatever on the part of the Mint.

27,139. You think in the meanwhile, that, however near we approach that limit, the market value of gold would be controlled by this bi-metallic ratio?—As long as the two metals were both in circulation I think so, and I think when it came to the point that you refer to, there would be no anxiety whatever to establish a gold basis, because it would be seen clearly that a gold basis was out of the question altogether, and therefore, people would acquiesce in a silver standard.

27,140. There is one point with respect to the report of those Commissioners who maintain that a fixed ratio between the two metals was possible, about which I should like to ask you. I think you will remember that they were careful to guard themselves by saying that a stable ratio might be maintained in any conditions fairly to be anticipated in the future so far as they could forecast them from the experience of the past?—Yes.

27,141. Was not the experience of last year in the fall of silver altogether unprecedented?—But that fall was not due to production, it was due solely to legislation and to the power of legislation.

27,142. Was it not thus, that certain legislation gave way? I understood that the legislation in India was intended to raise the value of the rupee, and that the legislation in America was clearly intended to raise the value of silver; but that legislation gave way, did it not?—No. What I had in view when I spoke about the legislation of 1893 was the closing of the mints to silver on the part of India and the closing of the mints to silver on the part of the United States. Both those measures have been maintained and they caused a fall in silver which I should regard as partly a moral fall—a panic fall—not purely statistical. I do not think it can be accounted for altogether by considerations of demand and supply, because the production of silver has not increased.

27,143. But the production has been increasing for 40 years steadily?—Steadily, but there has been no sudden increase.

27,144. It is an accumulating process?—It is not an accumulating process in this sense, that there was no stock existing, no large mass existing, and available, which could be thrown on the market. The visible stock has always been small.

27,145. At any rate there was an unprecedented fall in the value of silver as compared with the value of gold?—Yes, undoubtedly.

27,146. Does that not come within what they say that they think the ratio might be maintained so far as they can judge by the experience of the past?—I think they were alluding to fluctuations in the productions of the metals, not to an alteration in the value brought about by legislation, because they proposed to stop that.

27,147. They say any conditions fairly to be contemplated in the future so far as they can forecast them from the experience of the past?—Such a circumstance as that which you have just been mentioning would be impossible under a bi-metallic system. The nations could not close the mints in the way suggested. The agreement would prevent that.

Prof. H. S. Foxwell.
29 June 1894.

27,148. When this agreement had been come to, it would have to be adhered to, however disastrous it might be to any particular country that took it up?—How it could be disastrous, I never have been able to see. Effect of bimetallism.

27,149. We have heard about England being a creditor country; we should receive less, for instance?—In proportion to the rise of prices we should receive a little less.

27,150. Our prices, I suppose, might rise to an injurious extent—I think you would admit that?—It would be possible if the ratio were badly chosen, undoubtedly.

27,151. Then there would be a possibility of the ratio fixed by the Governments being such a ratio as would be injurious to some particular country?—I do not think it possible that civilised Governments would choose such a ratio.

27,152. You think it would not be a leap in the dark, as the Commissioners suggest; you could so accurately foretell the effect that there would be no danger?—The expedient of the climbing ratio would give an opportunity of seeing that.

27,153. When they were working that climbing ratio they could not break it off if they had tied themselves to it?—It would be possible always, if the Governments felt that prices had risen sufficiently to stop the climbing ratio, to stop the progression.

27,154. That would require another agreement?—It would be likely to require another conference, but it is quite possible. I mean to say, you have it in your power to advance experimentally, if you wish.

27,155. As I understand, the proposal is to bring any quantity of silver to the Mint?—Yes.

27,156. And to give back for it paper which would be legal tender?—In all the countries concerned.

27,157. What would be the immediate effect of that do you think?—I suppose all the silver reserves would increase in all the European countries, or rather in all the countries agreeing.

27,158. England is the great silver market of the world; should we get more than our fair share brought to us, do you think?—I do not know why we should get more than our share.

27,159. To what extent, do you think, we should get it; they might bring an unlimited amount of silver there; if it came to a hundred millions, would you think it was about time to stop, or would you go to a thousand millions?—You would have too great a rise of price if it came to anything like that in a few years. Were you speaking of a hundred millions for the whole of the world, or for England.

27,160. I was speaking of a hundred millions for England?—Of course it would mean an excessive rise.

27,161. What has France got now?—France has 120 millions, roughly, of gold and silver together, 70 millions being gold, and 50 millions silver.

27,162. But, I suppose, France would increase its reserves?—Yes, certainly.

27,163. That would come to a hundred millions very soon?—The great part of that reserve of France is really in circulation, and they could not diminish it; it represents notes which are in circulation. They have more than 140 millions at the present moment out in notes.

27,164. But, if these reserves got above a certain amount, do you think the bimetallic tie would have to give way?—I do not think it would have to give way; but I think it would be a sign that the ratio for silver was fixed at rather too high a point.

27,165. And you would fix it then at a lower point?—As the ratio gradually rose, we could see whether the point reached was high enough or not.

27,166. If you had to alter it, would it not involve a very great loss to the Governments which had taken the silver at that price?—You would never need to go back, of course. It would be simply a question of stopping. Maintenance of the ratio.

27,167. No; supposing you had got down, we will say to 25, you might have to go back to 30. You might find you had miscalculated?—Surely not in progressing at so slow a rate as that. There would be no occasion to go back; it would be quite enough to stop at any point.

Prof. H. S. Foxwell.
29 June 1894.

27,168. Would not circumstances alter? Might not the gold become scarcer? Might you not find that these reserves became very much larger than you anticipated? What would you do if you had to do it; you would have to go back then if the tie had to be broken?—I do not think you would have to go back, because you would stop before you reached the point at which there was any danger.

27,169. But you could not stop suddenly. You would have to come to an international agreement?—An international agreement might be of this kind: that a permanent commission should be appointed to watch the various forms which the agreement might take.

27,170. You do not feel the smallest doubt that if you had this ratio, you could maintain it, and that the results you have indicated would necessarily follow?—I should like to put it in this way: that we could maintain the ratio in any conditions, except such conditions as would make a single gold standard an absolute impossibility. It is possible to assume a cessation of the supply of gold; a great diminution of the stock of gold. I admit that, and under those circumstances we probably could not maintain our ratio, and should pass on to a silver basis. But, on the other hand, it must be taken into account that under those conditions it would be absolutely impossible to carry on trade upon a single gold standard in any case.

27,171. Then you would pass from a gold to a silver standard?—We should pass gradually under the bimetallic system. You would have a catastrophe if you were on a single gold system. You would have what Professor Walras has described as a permanent state of industrial crisis. Suess has described it in almost identical words. Suess says there will be such a falling off in the supply of gold that if the world is going on a single gold standard you will have a permanent state of industrial crisis. I think he uses almost the same expression as Walras.

Climbing ratio.

27,172. You do not see any difficulty in working this climbing ratio?—I really did not submit that as a point on which I was ready to be examined. It would have to be gone into by practical men more accustomed to exchanges and monetary dealings.

27,173. You would either have to take that or to take a leap in the dark?—You would have to take what would be to some extent a leap in the dark, though you would have the experience of past history to guide you.

27,174. The experience might be fallible?—Yes.

Effect of a reduction of the ratio.

27,175. If you had to go back from 25 to 30 or from 25 to 26, and you had a large silver reserve, there would be a very heavy loss?—But much of that silver would have been bought at a much cheaper rate.

27,176. You would have given your notes on the understanding that you were bound to give 25 ounces of silver?—Yes.

27,177. And you might have to alter the ratio so as to give 26 ounces of silver or 27 ounces of silver for each ounce of gold?—But on the other hand you would have bought a good deal of the silver at the rate of 32 ounces to 1 ounce of gold at the beginning of the operation.

27,178. I am supposing that if you had not the climbing ratio?—I beg your pardon; let me consider it.

27,179. If you were taking, as we were saying, what was to some extent a leap in the dark, in reducing the ratio by taking 25 instead of 32, might not the Governments be involved in a very heavy loss?—My impression is that if the step was to be taken definitely once and for all the Governments would have to be on the safe side and would fix the ratio at a point, assigning a value to silver which was rather too low than too high.

27,180. Very near the market ratio of the day would you say?—Probably very near to the market ratio of the time.

27,181. At which they made the change?—Probably at that ratio.

27,182. Then there would be no rise in prices at all, I suppose?—Yes, because meanwhile, before you get to that point there would be a rise.

27,183. There might be?—In anticipation of it.

Bimetallism and depositors at banks.

27,184. If these holders of deposits in savings banks were anxious to draw out their money it would not be difficult for them to do so as their accounts do not average 15*l.* a piece; and if there was a panic, that would send up the price of gold very much; there are 120 millions in the Savings Banks?—It would be like when the Sherman Act was passed, not only was the effect discounted but it was much more than discounted as the event proved; the price of silver rose before the passing of the Act to a point which the passing of the Act did not justify, but it rose and rose rapidly. The withdrawal of deposits is a matter that I have never been able to understand, even in the case of the run on the Birkbeck Bank many people returned their deposit before the panic was over.

Prof. H. S. Foxwell.
29 June 1894.

27,185. There is no doubt there was a perfectly unreasonable run on the bank in that case?—So it would be in the case we are assuming, and one not justified by the market in any way.

27,186. That was the case of a number of poor persons in the same way as those whose savings are in these savings banks; and that shows that, whether right or wrong, they might make a similar run on the Savings Banks?—I have always admitted that you can never calculate what might be done from an ignorant impulse, but I think that much would depend on the confidence people had in the ability and foresight of those who are responsible for the change. It would certainly have to be be agreed to by the two parties in the State.

"Futures and options."

27,187. There was only one other matter on which I wished to question you, and that is not in connexion with bimetallism, but it appears on your brief. It is in regard to dealings in futures and options. We have been told by one witness that the greater part of the fall in the prices of wheat has been due to speculation in futures and options. Do you at all agree with that doctrine?—Of course, I have no special experience of those markets, but, looking at the thing from a general theoretical point of view, I see no reason whatever in the contention. As far as I can see, what is assumed is that speculation will generally be for the fall, and not for the rise. I should have thought that in all those cases it is necessary, to use a slang expression, to hedge such speculation, and that on the average there would be as much buying for the rise as for the fall. We have such speculations in consols and in various other securities, and I have never heard the suggestion made that it tended to lower the price of consols. I was inquiring the other day of an experienced member of the Stock Exchange as to whether he did not think that perhaps on the Stock Exchange itself, amongst the experienced dealers, there would be more speculation for the fall than for the rise, on the ground that the public would generally speculate for the rise in the ordinary straightforward way and that the expert would therefore speculate for the fall. But it was pointed out to me that there were grave difficulties in the way of speculating for the fall. Those who speculate for the fall are apt to be cornered, and my informant, who was a man of great experience, said that in his opinion there was very much less speculation for the fall for that reason. On that ground I should have thought that there was no reason for presuming that dealings in futures would, on the whole, lower the price more than it would raise it.

Great Britain and bimetallism.

27,188. (*Mr. Gilmour.*) Is it the fact that Great Britain has been the only country that has stood in the way of the adoption of the bimetallic system?—So far as I am able to judge, such countries as now occupy a somewhat cold or neutral position on the subject would gladly follow the lead of Great Britain if Great Britain made the least sign in the direction of the bimetallic system.

27,189. (*Mr. Giffen.*) Has it not been the case to some extent that some countries who are not very much in favour of bimetallism themselves have rather sheltered themselves behind Great Britain; I think that is the state of opinion?—Yes; and the example of Great Britain naturally has enormous weight with continental nations on account of our commercial position.

International bimetallism.

27,190. (*Mr. Gilmour.*) To carry out this bimetallic scheme, is it absolutely necessary that all, or almost all, the great nations of the world should enter into this international agreement?—I do not know whether it would be absolutely necessary; but, personally, I should not like to embark upon a bimetallic system without a union of the five greatest nations.

27,191. (*Mr. Giffen.*) The great authorities of bimetallism like Wolowski, Cernuschi, and Mr. Dana Horton, I think, were all in favour of a smaller consortium of nations doing it if they could be persuaded to

Prof. H. S. Foxwell. 29 June 1894.

do it?—What they thought was that as the Latin Union (or rather, as France, for we may leave the Latin Union out of it) had single-handed been able to maintain the ratio over the century up to that date, there was no particular reason why she should not continue to do so; but that was on the assumption, I think, that the *status quo* was maintained, that the chief silver-using nations remained silver-using nations. I do not think that even Wolowski would have held that view if he had supposed Germany was to become a gold-using nation.

27,192. Is it not quite clear that if France and the United States alone were to go in for bimetallism, their position relatively to all the other countries would be much stronger now than that of France was alone before 1873?—Yes, I think probably that would be so; America has increased so much in importance.

27,193. So that this idea of one nation waiting upon another, if there is much in bimetallism, has not much to be said for it, and if they had the courage of their convictions they might do it at once if they liked?—They have been very much influenced by the fall in the gold value of silver since 1873; a fall not previously met with in monetary history.

27,194. That has frightened them?—That has shaken their confidence possibly to some extent.

27,195. (*Mr. Gilmour.*) About gradually getting this ratio fixed; would the mere proposal of having such a union and of having it effective, naturally make the price of silver rise, but somewhat gradually, up to the ratio you mentioned?—It might make a very rapid rise. It would unquestionably have some effect. Many to whom I have spoken on the subject think that the effect would be so great and so rapid that the Governments would have to provide against it by saying that they propose to start upon the average of a certain number of given years, so as to prevent this speculation for a rise.

27,196. (*Mr. Giffen.*) That is a matter of speculation?—It has been put forward a good deal, I think, by business men. I may say that it has been put forward by those who are friendly to bimetallism.

27,197. That is on the supposition that there would be a much larger demand for silver after the thing came about than there is now?—Undoubtedly; it all depends upon the point we were discussing as to the unlimited demand.

Bimetallism and contracts in money.

27,198. With reference to that clause about legal tender, which Mr. Chaplin read to you on a previous question, is it not the case that in the questions before the Gold and Silver Commission, the bimetallists there were asked whether, under the *régime* that they proposed, it would be lawful to make contracts in silver money or in gold money, and not simply in money; and was not the answer, that they contemplated a state of things in which it would be lawful to make contracts either in silver money or in gold money, not in money simply?—I do not remember that, but I should prefer that myself; I should prefer freedom.

27,199. I mean that is how it was put officially?—Very likely; I am not prepared to say.

27,200. Is it not the case that in America, where there have been experiences of different moneys, that you may have contracts there either in money simply, which under the *régime* of inconvertible paper were payable in paper; or that you might have contracts in gold, or that you might have contracts in silver; and that the Courts would enforce under the general law of the United States either the one or the other, as the case may be?—No doubt, if they were specific.

27,201. That rather gets over the point which Mr. Chaplin made that under our present law we define what money means. Under the bimetallic system you might have two kinds of money really, and contracts in either one or the other would be quite legal?—But they would have to be specific contracts, they would not be general contracts in money, they would be contracts in a metal.

27,202. In specific money?—In a metal which was also used as money.

27,203. They would be contracts in lawful coin, but in a particular kind of coin as I understand; they would be enforceable in the same way as any other contract in money?—I think it is only fair to observe that the reason why you have gold bonds, for instance in America, is because of the uncertain position of silver.

27,204. They arose at the time when the uncertainty arose from paper?—From inconvertible paper; but that would not happen, of course, if you restored silver to an accredited position. The reason for a gold bond as against silver would not then arise, but you might have a cash bond as against paper.

27,205. This is a new point which is being dealt with. Is it not the case that the gold bonds are issued in the United States because they are afraid that silver would be made the lawful money of the United States as well as gold?—I do not think there is any such fear.

27,206. There is most undoubtedly?—You mean a fear of the adoption of bimetallism by the United States alone?

27,207. There is an apprehension of the adoption of bimetallism by the United States as I understand?—Alone?

27,208. There is also an apprehension of the United States going over to a silver standard by force of circumstances?—Yes.

27,209. For which reasons, and on account of the general apprehensiveness, contracts are now made specifically in gold?—I can understand that very easily. It is our object to put a stop to that period of apprehension as regards the future of the metals.

27,210. Still, while the agitation is going on, there is apprehension, and you do stimulate that apprehension while that agitation goes on?—Yes.

Monetary legislation in India.

27,211. Then with reference to the proceedings in India, to which Mr. Chaplin referred as a case in which the British Government has altered monetary legislation so as to affect prices; is it not the case that the conduct of the British Government in that matter, which does not apply to the United Kingdom, has been considered highly reprehensible by all the authorities, I think, on the subject, and as being quite contrary to the principles of monetary legislation in the United Kingdom itself?—I could not say that, I think.

27,212. It is quite contrary to anything that was ever done in this country itself, for many, many years?—You mean the restriction of mintage?

27,213. I mean the restriction of mintage, and the raising of the denomination of the rupee?—Yes; we have never done anything of the kind lately. I do not think as a matter of principle that there is a theoretical objection.

Views of authorities as to changes of standard money.

27,214. Although as a matter of principle—this is with reference to another question which Mr. Chaplin put to you—the regulation of standard money is within the competence of Governments, yet, as a rule it has been held, I believe, by the best authorities on the subject, that changes of standard money should not be frequent, and that they are rather to be deprecated than otherwise?—Undoubtedly.

27,215. That a very strong case indeed must be made out for any change?—Yes.

27,216. And some great authorities, like Locke, have deprecated any change whatsoever; they have gone so far as that?—Locke made a very great change.

27,217. But still he deprecated any change; that was his idea?—He might have deprecated it, but in the circumstances, what he proposed and carried amounted to a very great change.

27,218. But he did not do it as thinking that it amounted to a change; he deprecated the principle of change?—We should all deprecate the principle of change as far as possible; but what he did was to change the value of the current money of the country.

27,219. That is a specific charge against Locke; but yet it does not affect the principle which Locke laid down that there ought to be no change?—I should like to put this to Mr. Giffen: Supposing, for instance, the supply of gold fell off altogether, would there be any ground for a change?

27,220. I am not saying that I approve of Locke; I am merely wishing to get it on record, first of all, that the authorities on the subject rather deprecate change, and that, as a matter of fact, an authority like Locke has gone the length of saying that there ought to be no change at all. I am not saying that I agree with that extreme view?—But in practice he made the change.

Effect of ratio of 1 to 1.

27,221. Then, with reference to the ratio of one to one, which was suggested, your objection to it is, that it would cause such a great rise of prices?—Yes.

Prof. H. S. Foxwell.

29 June 1894.

27,222. But would it cause a rise of prices? Suppose the ratio to be one at which no gold would remain in circulation at all in the sense that you speak of; would not all the prices become silver prices?—Yes; but even so, they would be largely inflated.

27,223. Is that so?—You would be multiplying the mass of silver practically by increasing its valuation 15½ times.

27,224. Would not all debts become silver debts, and all bargains be made in silver, and the value of silver with reference to commodities would be settled as the value of gold now is in this country with reference to commodities?—Yes; but an ounce of silver would be able to discharge a debt which formerly would only be able to be discharged by an ounce of gold.

27,225. Suppose all the previous debts had been dealt with, the moment that happened everything would be upon the basis of silver pure and simple, as at that ratio gold and silver would not circulate side by side?—Even so, silver prices would be very high, would they not?

27,226. Are you quite sure; have you thought out that matter thoroughly?—The absolute disappearance of the gold? I always estimate prices in reference to some existing contracts. You are rather assuming that there would be no existing contracts; that there would be an absolute dislocation in our commercial history.

27,227. It is a mistake altogether to estimate with reference to existing contracts; we should rather estimate with reference to contracts that are to be made where people are free to exchange the metal which they have against the commodity which they wish, or *vice versa*?—I do not know how you can separate yourself from existing contracts very well; there are prices, salaries, rents, and so on.

27,228. But money is required as much for making new contracts as for fulfilling existing contracts?—Yes.

27,229. You can separate them quite well in that way?—But you see you are altering the value of silver in relation to commodities by your legislation.

27,230. I think the valuation of silver in relation to commodities will always depend upon the bargains which people make?—I certainly have never contemplated this absolute separation from past history, that you suggest now. I should like to have time to think over the effects of it. It is a curious suggestion. It is quite impossible, of course.

Market ratio and mint ratio

27,231. Is it not the case also that a considerable quantity of gold might remain in use, partly for hoarding purposes, and partly for circulation, but not at the legal ratio; it might be at a different market ratio. And what is to prevent that?—I should have thought what would prevent it would be this: that any man who had a debt to pay would not be likely to pay it in a metal which you say was at a premium; he would pay it in a metal which was not at a premium, and he would sell the metal which was at a premium.

27,232. Apart from the payment of debts, both gold and silver are required for the convenience of life and for other purposes. You carry about gold and silver for the purpose of doing certain business with, and not merely for the payment of debts?—I should have thought entirely for the payment of debts.

27,233. Not of past debts?—Not of past debts, but a railway ticket for instance, there is a debt incurred when you have the ticket.

27,234. You go to a railway station to take a ticket which is not a past debt, and if it is convenient for you to take gold you take gold, but if it is convenient for you to take silver you take silver?—Yes.

Prof. H. S. Foxwell.

29 June 1894.

27,235. So there is a demand for both gold and silver for special uses?—Do you suppose I should go and buy a railway ticket with gold which was at 5 per cent. premium if I could equally buy it with silver which was at par?

27,236. If the premium was allowed you at the railway station why should you not?—Why should they allow it?

27,237. Because it is more convenient for them to take gold than to take silver? It is more convenient to handle, why not?—That is purely a matter of coinage again.

27,238. Why not?—I take it that we could easily get over any difficulty arising from the handling of the gold by having notes.

27,239. I should like you to re-consider altogether the proposition that gold must go out of circulation altogether before the ratio gives way. I think there is no evidence for that whatsoever?—I was content to put it on the ground of history on the previous occasion, and to say that I have no knowledge of two prices arising in that way.

27,240. I do not agree with you in your reading of history at all in that matter, but I am putting it now as a matter of theory; what is to prevent it?—The interest of mankind is, I think, to prevent their paying premiums on a metal when they can get another metal which will serve their purposes equally well without a premium. You are assuming that it does not serve their purpose.

Bimetallic system includes paper currency.

27,241. I am assuming that it does not serve their purpose?—But I cannot admit the hypothesis.

27,242. Surely you must admit that you can take 10*l.* worth of sovereigns with you, and that you could not take an equivalent value of silver at all?—But we propose to have paper.

27,243. That is proposing a new condition which has not existed?—It has existed again and again in the past in this country, and it was proposed by Mr. Goschen only the other day.

27,244. That is altering the money much further than introducing a bimetallic system?—I make the introduction of paper part of the bimetallic system most emphatically and always have.

27,245. And that we should give up the use of gold in daily life to the extent that we have it now?—We should certainly lessen it. I should not like to make a very arbitrary interference with custom. I think we should look to what the Canadians have done, what the Americans have done, and what the French have done, and that we should be always using notes against the double reserve.

Legal tender.

27,246. I am not going to continue this vexed question of the unlimited demands which take place at the mints; but I should like to put it on record that you say the difference is that what a man gets back from the mints is legal tender, and that that makes a serious difference between the metal which he gives to the mint and the metal in coin which he gets back?—Yes.

27,247. That is your contention?—That is my contention.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Fiftieth Day.

Thursday, 5th July 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Baron Rendel.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
George Lambert, Esq., M.P.
Charles Whitehead, Esq.

Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, Esq., *Assistant Secretary.*

Mr. Thomas Mercer called and examined.

Mr. T. Mercer. 5 July 1894.

27,248. (*Chairman.*) You are a tenant farmer near Liverpool?—Yes.

27,249. How long have you been a farmer there?—On my own account for 36 years I think it is.

27,250. What size farms do you cultivate?—219a. 0r. 29p.

27,251. Are you a member of the Farmers' Association?—I am a member of the Liverpool Farmers' Club only.

27,252. Are you here to represent their views?—No, not at all.

27,253. Do you think you do in fact represent the views of the farmers in the neighbourhood?—Yes, I do represent the views of the farmers in the neighbourhood.

Effect of depression.

27,254. Has the agricultural depression affected your district?—Yes, it has affected it to some extent, a good deal, I may say, now, because wheat has got to such a very low price. I sold some myself a fortnight ago, some very good wheat, at 3*s.* 5½*d.* for 70 lbs., a price at which I never sold before in my life.

Particulars of farm.

27,255. What is your farm, is it mainly dairy farm?—No dairying at all, all ploughing. We grow corn, potatoes, wheat, oats, and clover hay.

27,256. Is that the general cultivation of the district?—Yes.

27,257. How near is it to Liverpool?—We are about 7 miles from it; we cart all on and all off.

27,258. What is the main source of profit on your farm?—The clover hay and the potatoes; but the potatoes have been at a low price these last two seasons, though they have been big crops.

27,259. You have not got competition in respect of potatoes from abroad, have you?—No.

27,260. Have you much hay?—Clover hay, we generally mow about 85 statute acres.

27,261. You have not got competition from abroad in respect of your hay?—Certainly, very much in respect of hay. It has lowered our hay 30*s.* per ton.

27,262. Are there any farms unoccupied in your district?—No.

Reduction of rent.

27,263. Have the rents been reduced?—We have had concessions, that is a percentage.

27,264. You have had abatements?—Yes.

27,265. But no general reduction?—No general reduction.

27,266. What do the rents average about there?—On the better land, about 2*l.* to 2*l.* 10*s.* the statute acre; on the mossy land about 25*s.* to 30*s.* the statute acre. There are different classes of land.

27,267. The rents have been maintained?—Yes, there have only been abatements.

27,268. When did the abatements begin?—We had an abatement about five years ago.

27,269. And every year?—No, we had a permanent reduction of 5 per cent.; the tenants agreed to take that rather than a 10 per cent. return. They offered us 5 per cent. permanent reduction.

27,270. You took 5 per cent. permanent reduction?—Yes.

27,271. Then there has been 5 per cent. reduction?—Yes, we have got that permanently.

Demand for farms.

27,272. When farms are unoccupied are there demands for them?—Yes, plenty of demands for them.

27,273. Plenty of people ready to come in with capital?—Not so much with capital. They are hard working men, are the Lancashire men.

27,274. The farms are small, I suppose?—Yes, they are small farms.

27,275. What do they average?—The average is about, I should think, 80 acres.

27,276. Not more?—No.

27,277. So that a man who comes in does not want very much capital?—No.

27,278. He works it with his family, I suppose?—Yes. There are some less than that and some larger.

27,279. Which have done best of late years, the small farmers or the big ones?—The small farmer cannot make any money at all; when his family has lived off it there is nothing at all for him.

27,280. But still, when a farm is vacant, notwithstanding that, are there applicants?—Yes.

27,281. How do you account for that?—Because he is a working man, and he would sooner do that than receive wages.

27,282. They prefer working for themselves?—Yes, if they have a family.

27,283. I suppose they come in with some capital?—A little very likely; they might have perhaps a hundred pounds or two.

Labourers' wages.

27,284. What has been the condition of the labourers in your neighbourhood?—The labourers are very well to do; I give all my horsemen 1*l.* a week and their cottages and gardens.

27,285. Have wages been maintained or have they risen rather?—There has been no difference for this last 10 years.

27,286. Previous to that had they risen?—A good deal.

27,287. How much have they risen?—We used only to give our horseman about 15*s.* a week and his cottage.

27,288. Now you give him 1*l.* a week?—1*l.* a week and his cottage free.

27,289. The last 10 years the wages have been about stationary?—Yes.

27,290. I suppose the low prices of food of every kind, and clothing, have been of great advantage to the labourers?—Yes, I should think so; they must have been.

Mr. T. Mercer.
5 July 1894.

27,291. Is there less labour employed in the district than formerly?—There is less English labour. We have very little English labour. When they get married they generally go to Liverpool, they get better wages there.

Irish labour.

27,292. What is the labour?—Irish labour.

27,293. When you speak of 1*l.* a week do you mean for English labourers or Irish?—English labourers. We give Irish labourers 1*l.* a week in hay time, harvest time, and potato-digging time.

27,294. What you mean is that the Irishmen come in harvest time and potato-digging time?—Yes, in hay time, harvest time, and potato-digging time.

27,295. Then you do not employ the Irishmen permanently?—Yes we do, but we have extra hands at those three times, hay time, harvest time, and potato-digging time. We keep them on the farm. We could not get English labour.

Condition of cultivation.

27,296. Is the cultivation of the land improved in your district or no?—Yes, it is improved, no doubt, from what it was 20 or 30 years ago. It has improved a good deal.

27,297. Do farmers find the only way of making money is to cultivate to the very best?—Yes, to keep it in a very high state of cultivation.

27,298. They have done that in order to meet the low prices?—Yes, there is no other way for it.

Changes of tenancy.

27,299. Have there been many changes of tenancy in your district?—No, very few; there have been three or four small farms this last time, but they have had to go to small tenants; they are let again.

Labourers.

27,300. Then you say that the native labourers, the English labourers, are very much induced to leave the district and go to Liverpool, for the purpose of getting better wages?—Yes, we have not cottages to keep them; when the young men get married there are not cottages to keep them on the farms.

27,301. There is no deficiency of labour?—We get plenty of Irish labour.

27,302. I mean if you want skilled labourers, is there any difficulty in getting them?—Yes, there are very few, only horsemen. The Irish skilled labour is a good deal better than it used to be. I have had men come to me for over 30 years, who are quite as handy as Englishmen.

27,303. When you want men to look after the horses do you find it difficult to get them?—No.

Low prices.

27,304. What do you attribute the low prices to?—To the foreign competition, foreign supply.

27,305. Have you had bad seasons in your district? We have. We had a very dry summer last year, but still we would rather have it than a wet summer. A few years ago we had them continually wet, in the seventies, 1872 and so on to 1876 I think, I forget just which year.

27,306. During the last few years have you suffered at all from bad seasons?—Not just these last two years.

Price of hay.

27,307. You did not suffer from the drought last year?—We suffered a good deal. We should not have suffered so much providing our hay had kept up to anything like the price, but it has gone down so. We had not much more than half a crop of hay.

27,308. Has the price gone down?—Yes, it has gone down 30*s.* per ton.

27,309. Last year?—Yes, last year's crop.

27,310. I thought the price of hay had been very high?—Not in Liverpool. You have it higher here I can find than what we have in Liverpool, a good deal.

27,311. What were you getting for your hay?—At the commencement of the season I was getting about 6*l.*, but now it has dropped to about 4*l.* 10*s.* or 5*l.* for the best hay.

27,312. Up to when did you get 6*l.*—About March, I think.

27,313. About March in this year?—Yes.

27,314. After the hay season of last year to March of this year you were getting about 6*l.*?—Yes.

27,315. Is that a bad price?—No, we did not consider it a bad price; but then when it came down to 4*l.* 10*s.*, and less than that, we did consider it so. The very best of hay did not come down to 4*l.*, but the commoner hay came down to 4*l.*

Mr. T. Mercer.
5 July 1894.

27,316. I suppose that was partly due to the mild season, the mild winter?—No, it was due to nothing at all but the American hay flooding our market, thousands of tons.

27,317. I suppose in ordinary years there is very little hay imported?—None that I know of from America, only what they brought over in the cattle boats.

27,318. The very high prices of this year induced the Americans to send hay over?—Yes; there is plenty of American hay being sold at about 2*l.* 10*s.* to 2*l.* 15*s.* per ton by auction in Liverpool.

27,319. (*Mr. Channing.*) This year or last year?—This year; they flooded it so that it has been laying on the quay.

27,320. Was that imported this year?—Yes.

27,321. Has it paid them at that price?—Certainly not.

27,322. (*Chairman.*) Taking the average of the last five or six years, have you got a lower price for your hay than formerly?—No, I do not know that we have, but then we have not had the imports before this last season as we have had.

27,323. I am not talking of the last season; I am talking of the last four or five years and comparing those with previous years; has the average price of hay much fallen or not?—No, I do not think so.

27,324. Then you have relied mainly on hay and potatoes for your returns?—Yes.

27,325. I suppose you have grown rather less wheat?—No, we generally grow about 50 statute acres of potatoes, and we sow all that land with wheat; manure it heavy and sow it with wheat. We must keep our rotation.

Price of potatoes.

27,326. Take potatoes: has the price of potatoes fallen much on the average of years?—Yes, and they have been very low these last two seasons.

27,327. That I think was due to very good crops?—Yes, heavy crops.

27,328. But apart from the last two years has the price of potatoes fallen much or no, as compared with a few years ago?—Yes, we have never had them as low for many years as they have been the last two years.

27,329. I am not talking of the last two years; I want to eliminate those two years and I want you to say whether, on the average, the price of potatoes has fallen as compared with the previous years?—No, I do not know that they particularly have.

27,330. Have you got any list of prices for some years past?—I have not with me. Plenty of potatoes I know have been sold at 30*s.* a ton this last season, carted to Liverpool.

Tenure.

27,331. With regard to the tenure of land, what have you got to say?—I do not see that we can improve on that at all; we have free cultivation and our landlord allows us to do anything we like, providing we manage our farms well.

27,332. I suppose you only hold on a yearly tenancy?—Yes, that is all.

27,333. But you have great confidence that that will be renewed year by year?—Yes, we have every confidence in our landlords.

27,334. Whom do you hold under?—Lord Sefton.

27,335. Do the tenants generally remain under him?—Yes. I think our family has been under them about 300 years.

Rates.

27,336-7. Then, with regard to local rates? Is yours a purely rural union or no?—It is rural.

27,338. Quite a rural district?—Quite a rural district; but we are in the West Derby union.

27,339. What do the rates average now?—3*s.* 4*d.* in the £, the poor and highway rates.

27,340. What were they 10 or 15 years ago?—I should think not more than 2*s.* 6*d.*—I have not just the figures.

27,341. What is the cause of the increase?—I do not know; they spend the money in such a way that it ought not to be spent.

27,342. Who spends money in a way that it ought not to be?—The Guardians.

27,343. Does it mainly go in the Poor Law, or what?—Salaries and the like of that, I suppose.

Mr. T. Mercer.

5 July 1894.

27,344. Salaries, you believe?—I should think a good deal in salaries.

27,345. The ratepayers apparently do not look after their interests?—The ratepayers have a very poor chance; the country guardians have a very poor chance.

27,346. Why is that?—I do not know; if they want anything carrying they will see that they are not there, they will do it when they are not there.

27,347. Do you mean that the guardians from the town districts overrule you?—I think so.

27,348. I thought you said it was a purely rural union?—Ours is rural; I misunderstood you.

27,349. (*Mr. Channing.*) Does it include the West Derby Division of Liverpool?—Yes.

27,350. (*Chairman.*) Then there are large town districts in your union, I suppose?—Yes.

27,351. Am I to understand that the guardians of the town districts over-ruled the other guardians?—Yes; there are the Cottage Homes not more than a quarter of a mile from where I live, and I suppose it costs 10*s.* a head to keep the children there. I do not know what the labourer would do at all, nor a farmer either, if it must cost 10*s.* per week to bring his child up.

Judicial rents.

27,352. Is there any demand among the tenants in your district for judicial rents—for the determination of rents by an outside authority?—No, not now.

27,353. Not at all?—Not now, there used to be.

27,354. There used to be?—Yes.

27,355. They do not wish for it?—No.

27,356. Have you read the evidence given here by Mr. William Smith?—No, I have not.

27,357. Have you heard of Mr. William Smith?—I think I have heard of him, but I do not know much of him.

Protection.

27,358. What is your remedy for the depression, such as it is?—I cannot see anything but protection.

27,359. Protection?—Yes, in some way, particularly the manufactured goods. I do not know that I would put much on the raw material. We have had bran dearer per pound than wheat this last winter, because there is so much flour coming from America that we do not get the offals, and that makes the offals very dear here, bran and coarse flour.

27,360. A duty upon potatoes and hay would not very much affect you in ordinary times?—We would not want a duty on potatoes at all.

27,361. Or hay, in ordinary times?—I do not know, I am sure.

27,362. According to your statement, in ordinary times there is no importation of hay?—I am afraid there is a channel open now that will not be closed to American hay.

27,363. Now that it has found its way here, you mean last year, it will go on?—I think so. The shippers carry it so cheap that it is quite my opinion that it will go on.

Wages.

27,364. (*Mr. Giffen.*) You told us that wages have been pretty much the same for the last 10 years?—Yes.

27,365. But before that you said there was a rise of wages?—Before the 10 years, yes.

27,366. About what time did the rise of wages take place; was it not 20 years ago or thereabouts?—No, it is not 20 years since; I do not think so.

27,367. Since the rise of wages took place?—It might be; I do not think it is.

27,368. You could not give us exact particulars?—I could not here; it is more than 10 years ago, certainly, but perhaps it might be 15 years ago. I should think it might be 15 years ago.

27,369. That is to say, before 1879, before that time?—Yes, I think it would be before that. I have not just the notes of it. I am speaking from memory. I know I was the first farmer to raise the horsemen's wages to 1*l.* a week in our district.

27,370. At what time was that?—Really I could not say, speaking from memory.

Mr. T. Mercer.

5 July 1894.

Protection.

27,371. If you had the moderate protection that you speak of, and what you speak of as a reasonable rise of prices, would not the effect be, as there is great competition for farms, that rents would go up, and the tenant farmer would not be any better off than before?—No, I do not think so. Unless something is done, the farmers in our district cannot go along as they are at all.

27,372. But is it not to some extent a question of rent?—No.

Rent.

27,373. If you had rents reduced they might be better able to go on?—I do not think so. If land goes down in our part of Lancashire, I think it will be a great national calamity, I may say.

27,374. If there is so much competition for farms, is it not partly the fault of the tenant farmers themselves paying too much rent?—I do not think so, they do not change their rents for all the competition. I dare say there is not another district in England where the farmers work like they do in our district. I have been over the country. There is one thing, if you would allow me just to name it. We are in the West Derby Union; I could go and keep 500 horses in Liverpool and I would not pay a penny on the earnings of those horses to the poor rates, only just on my stables. I think the land, the raw material, is over assessed altogether for the poor rates. The land cannot bear it. It will take three parts of my wheat crop this year to pay my rates.

Freedom of cultivation.

27,375. (*Mr. Gilmour.*) You said you had virtually freedom of cropping?—Yes.

27,376. Have you freedom of sale also?—Yes, in Liverpool market.

27,377. I mean you can sell anything you produce off the farm?—Yes.

27,378. Are you bound to bring in a certain amount of manure?—No, no tie whatever.

27,379. And yet the land is being kept up in your opinion rather better than it used to be?—Yes, it is. I notice that some few farmers as soon as they let the land go down are down themselves, they are very soon broken.

Labourers.

27,380. You complain of the want of cottages for the English labourers, how do you house these Irish labourers when they come over?—We have a house on the farm for them.

27,381. They live in a bothy sort of thing?—In a house, we have got a nice place for them.

27,382. And your own English labourers can do better than that?—Yes, it appears that they can; they can go into Liverpool and get their 28*s.* a week, and so on, when they are married.

Security of tenure.

27,383. You said that you personally, and the tenants on that estate had thorough confidence in the landlord; is that the prevailing feeling do you think of the tenantry in the country, as far as you know?—I should think so. Lord Sefton and Lord Derby own all for miles round, so we have confidence, I believe every tenant has, that they will not disturb a tenant.

Rent.

27,384. (*Mr. Dalton.*) What is the average rent per acre in your district?—It will run, I suppose, from 30*s.* to about 2*l.* 10*s.* a statute acre, or something like that.

27,385. What is your own rent per acre?—My rent is 2*l.* 1*s.* 8*d.* per statute acre, including three cottages free.

27,386. It is rather a high rent?—We have some very poor land in our district, mossy land, which lets at about 30*s.* an acre.

Small farms.

27,387. Do the small farmers get a living off their farms?—Yes.

27,388. Do they get into debt at all?—Three or four have got into debt this last season and been sold up.

Straw.

27,389. Do you sell much straw?—Sell all off, everything.

27,390. Do you get a good price for the straw?—We are getting a good price for the straw now.

27,391. To what extent does that make up for the fall in the price of wheat?—We had not half a crop of straw.

27,392. Last year was a bad year?—Yes.

27,393. In an ordinary year has it much compensated for the fall in the price of wheat?—As a rule the average price of straw is about 2*l.* a ton, I may say in ordinary years, not at the present time; it is more now; it is 4*l.* per ton now.

Mr. T. Mercer. 5 July 1894.

27,394. How much straw do you get on an acre in a good year?—I suppose we will get about a ton and a half a statute acre.

27,395. That must add very considerably to the value of the crops, must it not?—Yes.

Rates.

27,396. You consider that the rise in rates is partly due to your guardians paying high salaries; but do not they get nearly all the salaries repaid from the Government grants?—I do not think so—the officials?

27,397. Your guardians get a sum paid them out of the Government grant for the salaries of their officers, which is equal to the whole of the salaries they paid in the year ending March 1888?—I was not aware of that.

27,398. So that the only part of the poor law salaries that can fall upon the rates is the difference between the salaries in the year 1888 and at the present time, so that ought not to raise the rates?—Does the clerk to the guardians get a portion of his salary paid from Government?

27,399. The guardians get it paid them by the county council and the county council receive it from the Government?—I am not aware of that.

27,400. That has been so ever since the Local Government Act of 1888?—I never heard of that before.

27,401. There is no doubt about that?—Of course, I accept it, but I had never heard about it.

Small farms.

27,402. On the average does the small farmer make his living out of the land in a good year?—He makes his living, but in a very poor way. He has to live very plain and dress very plain too, and works nearly night and day—the very small farmer.

27,403. Harder than a common agricultural labourer?—A good deal harder.

27,404. Have they good farm houses?—Yes, fair farm houses—sufficient.

Rent.

27,405. (*Mr. Channing.*) Did you say your land is rented at about 50*s.* an acre?—Some of it; it differs a good deal according to the value of the land.

27,406. Taking your farm all over, what is it rented at?—At a little over 2*l.* per statute acre.

27,407. Why is it rented so high, is it specially near to market?—It is specially near to market and it is in a high state of cultivation.

27,408. Have you used it chiefly as a market garden?—We do not market-garden at all. We grow nothing but wheat, oats, potatoes, and clover hay. We do not grow any cabbages or anything like that.

27,409. Is that about the same rent that other farmers are paying in that district?—Yes, just round our district, within easy distance of Liverpool.

27,410. Do you think the rent is so high because the land has been so highly cultivated in the past?—Yes, I suppose so; there is a good deal in the way that a farm is situated for the rental.

Straw.

27,411. Do you grow the wheat now chiefly for the sale of the straw which you are able to sell off?—Yes; we have to keep in rotation with our farm, else we very soon get wrong. We have so many acres of all kinds of produce.

27,412. Did I understand you to say you are not required in your agreement to replace the straw with any equivalent amount of manure?—Not at all; we are not bound in any way.

27,413. What do you do with regard to your land yourself?—We cart all our manure from Liverpool.

27,414. You get it from Liverpool and use it in that way?—Yes.

27,415. Do you use any artificial manure also?—Rarely; some little artificial manure. We have to grow the biggest crops we can grow or else we are no use at all.

27,416. Do I understand you to state that you do not represent any farmers' association here?—No.

27,417. You belong to the Liverpool Farmers' Club?—Yes.

27,418. Do you attend the meetings of the Liverpool Farmers' Club?—Very seldom. I might go occasionally.

27,419. Are you aware of any discussions they have had about the Agricultural Holdings Act?—No, I do kntot now hat they have.

Mr. T. Mercer. 5 July 1894.

27,420. You have not any information of any resolutions they have passed?—No; there has been a talk of Lord Winchelsea's scheme, I know, in the club, but I do not know much about it.

Reduction in rent.

27,421. (*Captain Owen Thomas.*) Are you satisfied with the reduction of five per cent. which has been made?—We have been satisfied so far, but now as the hay is knocking us down so I do not know what we will do; we cannot get along at all, because we have made a good deal of money out of clover hay which keeps up the other crops.

27,422. Are you speaking for yourself or for the majority of the farmers in your district?—The majority of the farmers in our district.

27,423. Have you applied for a further reduction?—No.

27,424. Do you keep farming accounts?—No, we do not.

Results of farming.

27,425. You do not know really whether you have been making money or losing money?—Only by the bank book.

27,426. What have you done during the last three or four years?—I could not say at all.

27,427. Lost?—I could not tell you at all. We have been under the Earl of Sefton for 300 years; we ought to have a little bit of capital amongst us, surely, ought we not?

27,428. We should rather like to know whether you are making money or losing money?—We are not making any money at the present time, and that is why the man without capital now is bound to go; he cannot help it.

Ground game.

27,429. Have you much ground game on the estate?—I have not very much.

27,430. Do the tenants take advantage of the Ground Game Act?—No.

27,431–2. Why?—There is only one case that I know of under the Earl of Sefton in which the tenant gave notice himself, and then commenced to kill the ground game.

Results of farming.

27,433. (*Chairman.*) What amount of capital have you got invested in your farm? How much an acre or how much altogether?—I can scarcely say, because since I came to the farm I have drained it all, the landlord giving me tiles, and cleared it all, and put new fences through it. I have 3,500*l.* in it.

27,434. Including cattle and horses and everything?—Quite.

27,435. When you say you are not making anything do you mean you are not paying interest on that capital or what?—I do not think we have paid interest on that capital the last two years at all; I am sure we have not.

27,436. But before the last two years you did do fairly well?—Yes, fairly well.

27,437. Could you estimate at all what profit you have made on your capital apart from the last two years?—No, I could not tell you, not now.

27,438. Do you think if you look into your books or if you think over it you can add it to your evidence afterwards, and say what you have made on the average of late years?—No, I could not say, because my income is mixed altogether. I do not keep any account, only the banking account, that is all.

27,439. When you say it is mixed, have you got other means?—I expect so, or else I would be very badly off. I had a few thousand pounds to begin farming with. I was independent and could have been still independent if I had never commenced farming at all, only I have six sons.

27,440. I think you said your family had been long on the farm and you have accumulated capital?—We ought to do, surely.

27,441. Up till two years ago you think you did pretty fairly well?—Just fairly, making my way, but I have had six sons working on the farm; I have four

Mr. T. Mercer. 5 July 1894.

working on the farm now, and do a day's work every day. I came to London yesterday, but I was working amongst the hay till 5 minutes to 11 o'clock.

27,442. Do you pay your sons wages?—No, not those who stop at home. I have two out on farms, one under Lord Derby and one under Lord Sefton.

27,443. Do these others hope to go out and get farms themselves?—I will get farms for them, no doubt.

27,444. You will give them some money to stock their farms with?—Yes, I will set them up.

27,445. Then you do not think it an altogether hopeless business?—They are brought up for farming, and what must they do? If the land goes down in this country what is to become of our country?

27,446. Still they might take their capital somewhere else and go abroad; emigrate to a farm somewhere in the States?—They will have to please themselves about that.

27,447. Apparently they prefer to remain in England?—I do not know; I cannot say whethey they will or not, now. I have one son who has been to America to look.

27,448. Has he done well?—He only just went to look at America, to see the farming there.

27,449. As a result did he remain there?—No, he did not intend to remain at the time; his inclination is to go.

27,450. Do you think he will go?—I do not know whether he will go or not; his inclination is quite to go, but we do not want him to go. His mother does not want him to go.

27,451. Do you think there is a fair prospect for a man setting up in England with a little capital?—I do not think so, at the present time. I think it is a very bad prospect for him, but what are they to do? What business can they go to now? They have been brought up to farming.

Ground game.

27,452. (*Sir Nigel Kingscote.*) Did I understand you to say that on the estate under which you farm, if the tenants shot the ground game they had to quit their farms?—I would not say exactly that, but we work with the landlord; in fact it would not do at all to shoot the game. We take our farms on that condition, not to touch the game.

27,453. (*Captain Owen Thomas.*) Are you compensated for any damage the ground game does?—Yes, the farmers that are close to the woods are, or the plantations; but I am not close to any plantation.

27,454. (*Chairman.*) Is there much ground game?—A good deal of ground game.

27,455. Does it do you any damage?—Not me, it does not, but it does some farmers near the plantations. I have a son on a large farm at Croxteth.

27,456. Why do they not avail themselves of the power given to them under the Act of killing the game themselves?—What is the use when they take the farm not to do so?

Mr. T. Mercer. 5 July 1894.

27,457. But the Act of Parliament says, notwithstanding that they may kill the game?—Yes, but the Lancashire farmer as a rule is not a sporting man; we have never had time to sport or shoot.

27,458. (*Sir Nigel Kingscote.*) As a matter of fact they get compensation, do they not?—Yes, they get compensation where the game does them a lot of harm.

27,459. (*Mr. Dalton.*) How many acres is your farm?—It is 219 acres.

Rent.

27,460. If your rent was reduced from 50*s.* to 35*s.* there would be a very good living to be made off the farm, I suppose?—Why should we pay these heavy poor rates and all this on the raw material?

27,461. I am not talking about the rates; but there would be a good living then?—Perhaps there would; I daresay there might be; I do not know whether there would or not. If they are going to put us down with the clover hay now we will be good for nothing.

27,462. I suppose the imported hay is cheaper at Liverpool than it would be anywhere else in the country?—I suppose so.

27,463. I suppose you suffer a great deal more than a place that is further distant from it?—We do at Liverpool suffer very much.

27,464. (*Captain Owen Thomas.*) How long have you been paying 41*s.*8*d.* an acre?—I have been paying it ever since I took my farm, but my farm has been enlarged.

27,465. How long?—I have been farming about 36 years; it was not so large then as it is now, quite.

27,466. And it has been the same rent since?—Yes.

27,467. (*Chairman.*) And your landlord would find no difficulty in getting the same rent from somebody else if you gave it up?—No, in the state of cultivation my farm is in, he would get it easy enough.

Condition of farm.

27,468. (*Mr. Channing.*) Was it in the same state of high cultivation when you first took it?—Certainly not; it was in a very bad state of cultivation.

27,469. And you cleaned it and brought it into a high state of cultivation?—Cleaned it, and drained it, and brought it into a high state of cultivation.

27,470. (*Chairman.*) Would your landlord find it difficult to get a higher rent than you are now paying, if it was vacant?—I do not know, I am sure. I do not think he would get a higher rent than I am paying now. I am sure he would not.

27,471. (*Captain Owen Thomas.*) Would you be compensated for the improvements you have made if you left now?—Yes, for those improvements that have not gone beyond the time; we have a stated time.

The witness withdrew.

Mr. W. E. Bear.

Mr. William Edwin Bear called and examined.

Mr. W. E. Bear.

27,472. (*Chairman.*) You were, I believe, for many years engaged in farming in Essex?—Yes.

27,473. You gave up in the year 1878, when you became the editor of a newspaper dealing with farming?—Yes.

Farming in Essex.

27,474. You gave up farming then, at a very good time for Essex?—I gave it up just before the black year of 1879.

27,475. Had you made a good business of it?—No, although prices were much better then than they have been since. Mine was a heavy land farm, and we had some very wet seasons in the seventies. I was young and foolish at the time, and rather enthusiastic in the way of expenditure on improvements. I spent a great deal of capital in draining and chalking the farm on the security of a 14 years' lease, which security, of course, got less and less every year, I kept on improving till the tenth year; then I gave it up, on deciding not to renew my lease.

27,476. Your loss was mainly due, I take it, to the fact that you had invested the money on too short a lease?—Mainly due to investing in permanent improvements on which I had no security at all. Of course I knew I had no security except on my lease.

27,477. Apart from that, had you been making it pay fairly well?—Apart from that I just managed to live, that was all, my rent was high, and the land was very much out of condition when I took it, I took the farm when rents were just at the very lowest.

27,478. What rent were you paying?—It was about 2*l.* an acre on all the land that could be used either for feed or for arable.

27,479. It was a high rent rather?—It was a high rent for that land.

27,480. (*Mr Channing.*) In what district of Essex was it?—A very good district. It was in the Tendring Hundred, near the sea.

47,481. (*Sir Nigel Kingscote.*) Do you say it was 2*l.* an acre?—It was not quite 2*l.* an acre on the landlord's measurement, but on the working area—on the area that was of any use—it was just about 2*l.*

27,482. (*Chairman.*) In 1879 you formed the Farmers' Alliance, and you were the secretary of that?—Yes.

27,483. After 10 years of life it fell to pieces, mainly on the ground of differences amongst its members on the subject of protection?—Yes, that was the immediate cause of its splitting up.

Mr. W. E. Bear.

5 July 1894.

27,484. You have recently served as Assistant Commissioner to the Royal Commission on Labour, have you not?—Yes.

27,485. And you visited for that purpose several counties?—Yes.

27,486. Which counties were they?—Hunts, Leicestershire, Nottinghamshire, Hampshire, Bedfordshire, and Sussex.

27,487. Then you come before the Commission not so much to give evidence as to the actual existence of agricultural depression, but on the causes and the remedies?—Yes.

Foreign competition.

27,488. What, in your opinion, is the main cause?—I do not think there is any doubt that increased foreign competition is the main cause.

27,489. And the consequent fall of prices?—Yes.

27,490. Do you attribute the fall of prices to foreign competition rather than to any monetary difficulties?—I consider that is one form of what I call artificial foreign competition. The advantage which an exporting country has, where its currency is deteriorated in gold value, is, I think, a prolific cause of increased competition.

27,491. I do not know that we need go through the prices you give in your brief, unless you particularly wish it, because we have probably got them all from other witnesses. I believe you desire to point out the great reduction that has taken place in the area of wheat and the fall in the averages?—I only put those prices down so that I should not make a statement utterly unsupported by figures.

The seasons.

27,492. I think you attribute the depression much more to foreign competition than to bad harvests?—Yes. I do not consider the harvests of the eighties have been bad harvests as a rule.

27,493. I suppose you would admit that, as regards the south of England at all events, the last two years have been very disastrous from the point of view of the seasons?—Last year of course was a dreadful year. I suppose the year before was not a good one, but there is no doubt that for the south of England last year's harvest was the worst harvest they have ever had.

27,494. The yield of corn in the previous year was extremely bad, was it not?—Yes, but I suppose the depression was of much longer standing than those two years, and therefore I do not consider it is due mainly to bad seasons.

27,495. It may have been aggravated?—It may have been aggravated undoubtedly in the last year.

27,496. By the bad seasons, and by the fact that prices did not rise in proportion to the diminution in the quantity?—Yes. As far as the south of England is concerned. In the flock-breeding districts it was aggravated by the very bad harvest and the great fall in the price of sheep. I look upon the depression as existing since 1879.

27,497. You are quite entitled to cover a wider ground, but I wish to put it on the notes whether in your opinion it had been aggravated by the two bad seasons?—Very much.

27,498. I suppose the fall in the price of sheep was very largely due to bad seasons and bad fodder?—Yes.

27,499. The bad fodder would also be due to the bad season?—Yes.

27,500. Was not the fall in the price of cattle last year also largely due to the same cause?—Yes.

27,501. Cattle were forced upon the market insufficiently fed, and of course the farmers had not food enough to maintain them?—Yes, that was so no doubt; the extra trouble of the last two years no doubt has been caused to a great extent by unfavourable seasons.

27,502. But still, apart from the last two years, you consider the fall of prices has been such as to cause general depression?—Yes, I think so. I think, apart from the last two years, the harvests have been better than the average, and the seasons have been better than the average.

27,503. That is undoubtedly the case for the previous seven or eight years?—Yes.

27,504. The average production of wheat was rather above the average than below?—Yes.

27,505. But the last two years the average has been extremely low?—Yes, it has.

27,506. Then you desire to point out that there has been a considerable reduction in the price of beef and mutton?—Yes.

Mr. W. E. Bear.

5 July 1894.

Prices of meat.

27,507. But mainly in the the inferior qualities, would you say?—Yes, it has affected the inferior qualities most. Of course that is the point where the imported meat comes into competition with the English.

27,508. Apparently from the figures you have given here in respect of the first quality of beef and mutton, the fall has been about 15 or 16 per cent.?—The fall in beef has been three half-pence a pound for the first quality, up to 1892.

27,509. In the case of pork, apparently, from your figures, the average was 49*s.* 9*d.* per hundredweight in 1876 to 1880 and 47*s.* 2*d.* in 1891 to 1892; which is a comparatively small reduction?—Yes; pork of late has been selling almost as well as ever it did; the last two or three years pigs have been so scarce.

Price of butter.

27,510. What do you consider has been the fall in the price of butter?—It is very difficult to tell, because we have got no trustworthy statistics relating to home produced butter, and the foreign butter was mixed with margarine until 1885, which makes a difficulty. I have shown in my brief that if you put butter and margarine together there is a very considerable fall; the only doubt is to what extent there is more margarine now.

27,511. The real question is what proportion the margarine bore to butter in the former period; and unless you know that you cannot get accurate data?—It cannot possibly be got accurately.

27,512. Would it not be possible to get in some way or other the average price of butter in the market?—You might get the Irish prices; I did not think of that. They show a reduction, but not a very serious one.

Price of cheese.

27,513. Then in the case of cheese you say that the reduction has been from 2*l.* 12*s.* 8*d.* for 1876 to 1880 and 2*l.* 7*s.* 10*d.* for 1891 to 1892?—Yes.

27,514. That would be about 8 per cent., I think?—Yes, it is not very serious. There is no doubt that cheese makers are the most prosperous agriculturists at present.

27,515. Does that not probably show that in butter you would get about the same rate?—I think butter must have been reduced more than cheese.

Butter making.

27,516. I thought the tendency rather was to give up making cheese in order to make butter?—I do not think so. I think it is a very difficult thing to make a profit out of butter. It would be an extremely good average for 2½ gallons of milk to make a pound of butter, and 15*d.* a pound for butter would only be 6*d.* a gallon for the milk; whereas you can make a pound of cheese with a gallon of milk, and you ought easily to make 7*d.* a pound for your cheese if you make it well.

27,517. Both are manufactured from milk, and if the proportion of reduction has been 8 per cent. in the case of cheese, the probability is that the reduction in the case of butter does not differ very much from that?—I think the reduction in the price of imported butter (if you get it away from the margarine, which is very difficult) is rather more than it is in the price of imported cheese.

27,518. In the case of butter, do you think much might be done in the way of improving the quality?—A great deal has been done within the last few years, and a great deal more might be done, unquestionably. For instance, where the Royal Agricultural Show was held, the other day, in Cambridgeshire, the butter is atrocious, and the people prefer Danish butter.

27,519. Did you find in your inquiries in the districts you have mentioned, that Danish butter is sold in many of the inland towns?—Yes, I think so.

27,520. And is it bought in preference to the butter of the district?—I suppose you would hardly go anywhere without being able to get Danish butter in the considerable towns at any rate.

27,521. Do you see any reason why the butter, produced in the rural districts of England should not be as good as that produced in Denmark?—No; anyone can make good butter if he takes the trouble, unless he does it on a very small scale; and in that case farmers should do as the Swiss do; they should combine together and have village factories.

Mr. W. E. Bear. 5 July 1894.

27,522. In Denmark they take great pains to maintain the average of the quality, do they not?—Yes.

27,523. It is from the absence of that system that the English butter is so different in many parts of the country, I suppose?—Yes, I think so. It is due to the want of co-operation to a great extent, and to the want of taking the trouble to learn the best system. But I think there has been an immense spread of dairy information lately, and I should think the improvement in butter-making during the last 10 years has been enormous.

27,524. Then I see you consider the fall of prices is mainly the result of competition?—Yes, I think so.

Protection.

27,525. Do you consider that protection would not altogether be a remedy for it?—I do not think protection would be a remedy as far as tenant farmers are concerned, because I believe it would create a mad competition for farms once more.

27,526. The effect would be to raise the rents?—Yes.

27,527. And the tenants might be in the same position after the rents were raised as they were before?—Yes, I think so. There is something peculiar about Protection which causes a speculative feeling, I think, which is not caused by any other benefit which you could give the agriculturists.

Foreign competition.

27,528. Have you considered that the foreign competition is altogether natural, or is it in some respects unfair and artificial?—I think it is artificial in some respects, and that it is made unfair by the railway companies and by other means.

The currency.

27,529. Do you consider that it has been enhanced by the debasement of the currency, or by paper currency in foreign countries?—Yes, I think so, by the depreciation of the silver, for instance. Then the gold premium in Argentina has made a great difference this year. If it had not been for that the exports from Argentina this year would not have come in, just like the last straw on the camel's back, to break down the markets altogether.

27,530. Do you consider that the power of the paper currency in those countries is detrimental to their interests, in that it forces down the prices of their exports?—I do not think it is detrimental to the interests of the producers so far in the Argentine Republic. I think the producers have derived an immense benefit from the depreciated currency, because they pay for everything in that and sell their produce at gold prices.

27,531. The producer does, but the country, as a whole, must be rather a sufferer, because they get less money for their product than they otherwise would?—They get gold payment for what they export. I should say that the persons who own land and have it to sell are the worst off, because they get paper prices for their land. I am told that land has not risen in value in currency prices at all in the Argentine Republic; and of course with the 300 per cent. premium on gold, they really get very much less in gold value for their land than they have been getting.

27,532. I understand from you that you consider the producer may benefit for a moment because he pays for labour and other things in paper money and he gets paid in gold?—Yes, for the time being.

27,533. That being the case the labourer must suffer, because he gets lower wages. That is he gets paid in the depreciated currency, and probably he has to buy what he wants at the old rates?—Of course, if wheat is sold at gold prices he may have to pay for wheat at gold prices, but wheat is very cheap indeed in the interior of the country. For most things he buys I should think he pays at the old rates of currency, because they say the currency in the interior of the country has the same purchasing power as it had before. I believe wages have risen, at any rate quite sufficiently to compensate the labourer. The great disadvantage is to a man who wishes to save money there, and then come back to Europe. He is at a very great disadvantage.

27,534. I understood you to say that the producer gained, because he paid wages and so forth in the depreciated currency, and was better able, therefore, to export at a lower price?—Yes, certainly.

27,535. If that be so the wages, at all events for the moment, have not increased?—No, they have not increased to any great extent. I see that Mr. Gastrell gives a small increase but it is a mere trifle compared with the effect of the gold premium.

Mr. W. E. Bear. 5 July 1894.

27,536. Where that is due to the adoption of a paper currency, of course no action on the part of other countries could affect the matter?—Not unless you adopted bimetallism as a counteracting effect.

27,537. Even that would not be a remedy, unless the countries were to be a party to it, and to adopt a metal currency instead of a paper currency. Is that not so?—I am not quite clear.

27,538. I understood you to say that in the case of the Argentine Republic and other countries, the mere fact of their adopting a depreciated paper currency stimulated their exports?—Yes.

27,539. Therefore bimetallism would be no remedy for that, unless that country adopted the system of substituting a metal currency for their paper currency?—I am not quite clear how far it would meet that, but I suppose the effect of bimetallism would be to raise the price of wheat, at any rate as far as relates to checking exports from India and possibly from Russia.

27,540. I am now talking especially of those countries that you speak of, the Argentine and others, where there are exports which you think have been stimulated by their adopting a depreciated paper currency?—Yes, I suppose the Argentine Republic has also silver dollars, has it not, to a great extent as well?

27,541. I understood you to say that the difficulty was that they have not adopted a depreciated paper currency. That seems to me to be a matter independent of whether silver or gold is the basis of their currency?—Yes. The gold premium is, of course, on their paper money.

Market gambling.

27,542. Then with regard to gambling in wheat and other agricultural produce, what have you to say?—I think it is a very great evil, and I am afraid that it is likely to extend in this country. Since I wrote down my notes I have seen the advertisement of the National Consolidated Produce and Share Clearing House to have branches in all the principal towns of England, an advertisement appearing in the "Mark Lane Express" the other day, to establish a clearing house for dealings in cotton, wheat, maize, sugar, tea, coffee, lard, shellac, nitrate of soda, Lagos palm oil, turpentine, linseed, copper, pig-iron, silver, tin, and shares.

27,543. Is that with the view of preventing this gambling?—With the view of extending it and making a national clearing house in London for the convenience of transacting this option business.

27,544. (*Mr. Channing.*) To give greater facilities for it?—Yes; to give greater facilities for it and to register all contracts.

27,545. (*Mr. Giffen.*) Is that to supersede the existing Produce Clearing House in London?—I do not know; it would be a rival to it, I imagine. I should think it would swallow it up if it were successful. I do not know why they want this, nor whether it will come to anything. I know nothing about it at all.

27,546. (*Chairman.*) However, that is only an advertisement of a proposed scheme. It can hardly as yet have produced any effect?—No.

27,547. The question is whether the gambling in agricultural produce, in options and futures, or whatever they may be called, has produced any bad effect or not?—I cannot help thinking that the offer in the regular markets of millions and millions of bushels of wheat which are not in existence must have a tendency to lower prices in the first place.

27,548. Would not the offer to buy on the other hand equally have some effect, and might neutralise the offers to sell?—I do not think so, because if you imagine a real over-production to the extent of this fictitious over-production there would be buyers for any quantity of wheat at a price, but it would not prevent the price being extremely low even if you have over-production.

27,549. Every transaction seems to involve both a buyer and a seller, and I should have thought they would neutralise one another?—You might say that with actual over-production.

27,550. I should have thought that speculation would rather tend to average prices than to have any other effect?—I do not think so, because if you have ten times the offers of real wheat that there are in the country at the present time you would still have buyers for all

Mr. W. E. Bear. 5 July 1894.

that, and they would not neutralise the effect of this over production, but prices would go down enormously. I think a fictitious supply has a similar effect. You flood the market with offers of wheat, and it is impossible to tell whether it is real wheat or fictitious wheat as far as the market reports go. I do not think the system would have any effect at all if it were not transacted in the American markets, which are the only markets which make prices, and the only prices published in America are those of the option markets.

27,551. At all events these gambling transactions have had, in your opinion, a serious effect in reducing prices?—I believe they force them down, especially in a season when there is a large supply. They have got everything in their hands then. I believe the general tendency would be to reduce prices, not only because of this large fictitious supply, but also because of the insecurity which the tricks of the gamblers create.

27,552. (*Mr. Channing.*) Have these transactions increased in volume in the last two or three years?—In America undoubtedly, and in Liverpool too, and they have risen in London in a few years. The principal merchants of Mark Lane do not like them at all, and they look askance at the system.

27,553. They have increased in number?—I think so because they began on a very small scale, and they have now got their clearing house. Unquestionably the system has been growing in England for the last eight or ten years, ever since it sprang up. It is growing, and will grow, I am afraid, if nothing is done to stop it.

27,554. That increase coincides in date with the fall of prices; it may be the cause of it or it may not?—It coincides with the fall in prices, and the commodities which are the subject of options have fallen in price more than others. I do not know whether any previous witness described the nature of an option to the Committee

Other causes of depression.

27,555. (*Chairman.*) Yes, we have had that very fully from another witness; what other forms of unfair foreign competition are there?—Preferential railway rates given in the form of through rates on foreign goods is an unfair form of competition to which farmers are subjected; the sale of margarine as butter, and other adulterated articles as genuine, and the sale of imported meat and other produce as British.

Burdens on land. Tithe.

27,556. Then, with regard to burdens on land, what have you to bring before us?—The Commission has had evidence from the Assistant Commissioners of a very strong character, showing how high the burdens are in Essex and Hampshire. In many counties which I went into I found the tithes were quite as much as the rent, and in some cases the land was refused on the ground of having to pay so high a tithe.

27,557. Those must be rather exceptional cases of very high tithe, and a very high land tax, must they not?—Kent is the worst county of all, Essex next, and Hampshire is about third.

27,558. I suppose you will admit that that is a deduction from the rent, and that a high tithe and a high land tax are hardly matters which affect the tenant?—I think not, but still they are matters which keep the land out of cultivation.

27,559. Why? I cannot see that, so long as the land can be let for something beyond the tithe and the land tax?—Where it does not let then there is land thrown on the landlord's hands because no one will pay the tithe and rates on it. I saw a great deal of that in Hampshire when I was there, and of course Mr. Pringle has noticed a great deal of it in Essex.

27,560. Have you yourself known cases of land being unlettable because the tithe was more than the land was worth?—Unlettable in Hampshire. I was told of a case when I was there.

27,561. I thought there was provision in the Tithe Act to meet a case of that kind, and that there was a process under which the tithe could be reduced?—Yes, and I do not understand why it has not been applied more.

27,562. I mean where the tithe was so high that the land will not let for the amount?—I suppose the landlord will have to prove that in each individual year, but the tenant and the landlord have to make a bargain for a course of years together when the landlord is letting a farm.

27,563. Could you lay before the Committee any specific cases; because it would bevery interesting to inquire into a specific case of that kind in order that one may understand what the difficulties are?—I thought the cases had been given so specifically in Mr. Pringle's Report, that it was not necessary to bring details. I have not had actual cases brought before me in detail; I have only been told of them incidentally in going over these counties.

Mr. W. E. Bear. 5 July 1894.

27,564. It is all important to get actual facts rather than general information, because it would be interesting to have a specific case of the kind so that it may be examined, and we might discover what is the cause of the Act not operating?—I was collecting evidence for the Labour Commission when I went through these counties, and of course agricultural depression was only an incidental inquiry.

27,565. You mentioned just now that you had known of such cases?—I was told of two or three farms, and I was shown a large farm which was in very good order, where the tithe on it was about 5*s.* an acre, and the landlord could not let it for that reason.

27,566. Could you give us the name of the case?—(The witness gave a name, but afterwards wished to withdraw it, not being certain which of several farms he had in mind.) I was told of other cases, but I do not remember the names of the landlords. I was told that the tithe was 4*s.* or 5*s.* an acre, and that that was considered to be very much against the letting of the land. But of course Essex is the most striking case.

27,567. That would only turn upon whether the land is worth more or less than the tithe?—Yes, but where a man will not pay the amount of the tithe and land tax, even if he has it rent free, of course the land is worth nothing to the landlord.

27,568. In the case of the tithe there is undoubtedly a provision in the Tithe Act to meet that very case; therefore one would wish to know why it has proved to be inoperative?—I do not know why it has not been put into force. But you see you have the evidence of Kent, and Hampshire, and Essex from the Assistant Commissioners to show that land is thrown out of cultivation, and they give that as their reason. I have taken their word for it. I suppose they have investigated the cases.

27,568*a*. What other causes of depression are there?—I think that the burdens which land could bear well in times of prosperity it cannot bear now, and I think that the nation which insists on unlimited competition should place the cultivators of the soil on as favourable a footing as possible for meeting it. I think that the English farmer should be brought into the position of an American farmer as nearly as he can be by the removal of anything which handicaps him, and I think that the nation should be generous in that respect, and not be too hard from an economical point of view.

Reduction of rent.

27,569. Then with regard to the rent, what have you to say?—Rent, of course, has been reduced generally throughout the country, but there are some parts, such as in Lancashire and in parts of Yorkshire, and I believe in Cornwall, where the rents have been kept up almost to their old level. There are many cases where temporary remissions have been made instead of permanent reductions, which do not have the same effect.

27,570. You think that the temporary abatements are not calculated to inspire hope or to stimulate energy?—I think they are not.

27,571. Do you consider that there have been many cases where the landlords have only resorted to temporary abatements rather than permanent reductions?—That seems to be the evidence.

27,572. I mean, what is your own experience, not what is the evidence before us; can you state from your own experience that that is so?—No, I cannot. I have no experience, of course, except what I read.

27,573. (*Mr. Channing.*) By evidence, do you mean evidence derived from general sources of information, or evidence derived from what has been before us?—I mean evidence derived from general sources of information. I gather that there are many cases in which temporary abatements are made, and not permanent reductions. I think temporary abatements have rather a depressing effect upon agriculture than otherwise, because I think they keep men always anxious to get abatements and rather indispose them to try and improve their farms than otherwise. They keep them in the position of paupers.

Mr. W. E. Bear.
5 July 1894.

27,574. (*Chairman.*) I presume that after all the main question of rent must be whether the lands will let, or whether there are demands for farms?—Yes, of course.

27,575. Whether there are people ready to come in to give the rent?—Yes, to some extent. I do not think rents are based, universally, on competition. On some of the larger estates that I have been on I do not think they ever have been, but still, of course, rent is the foundation.

The Agricultural Holdings Act

27,576. Then with regard to the question of tenant right and the Agricultural Holdings Act, I presume you will not say that depression is due to anything of that kind, but that it is important that any wrong in that direction should be remedied?—Yes; I think in order to give hope for the future that a good Tenant Right Bill is of the utmost importance.

27,577. (*Mr. Channing.*) Do you not also ascribe part of the losses of farmers to the defective state of the law in the past?—I think that in many cases they would have been better if the law had been such as to encourage them to keep their land in first rate condition.

Security of tenure.

27,578. (*Chairman.*) Then have you considered that the Agricultural Holdings Act has not given the security which it ought to have given?—I think it has not given security directly to any considerable extent; it has done good indirectly, I imagine, by inducing landlords to make more liberal bargains with their tenants than they used to make; but as an Act, as far as its direct action goes, it seems to me to have been a lamentable failure.

Fixity of tenure and free sale of improvements.

27,579. Then what do you advise in respect of it?—For many years I have been a strong advocate of free sale. I do not believe that the valuation system will ever answer. It seems to me almost impossible to value improvements that have been carried out on a farm for years past.

27,580. By the recommendation of free sale you also mean, do you not, fixity of tenure or continuity of tenure of some kind?—I would not have any more fixity of tenure than I could help, but unfortunately you cannot get free sale without a certain continuity of tenure.

27,581. If you talk of free sale you must have some interest of a continuous character to sell?—I do not mean that so much; I mean if you sell your improvements to an incoming tenant this man must have security that he will not lose all that he has bought, by being turned out directly. That is the only thing.

27,582. Does it not almost necessarily involve in the principle of free sale that the vendor must be able to give to the purchaser some continuity?—He must for a certain number of years. In the Farmers' Alliance Bill which we drew up, we had, I think, eight years or seven years.

27,583. What is your actual proposal with regard to free sale?—That the outgoing tenant should be able to sell in the open market, with preemption to the landlord, improvements on his farm or his tenant right, the landlord having power to object to an objectionable tenant.

27,584. Would you insure to the purchaser a term of years during which he would not be removed?—Yes, the assurance should be given by law that the rent should not be raised within seven years or something of that sort, and then only to the extent to which it was due to other circumstances than the improvements of the tenant.

27,585. I only want to know exactly what your scheme is, is it that on leaving his farm an outgoing tenant should have the right of selling his interests to a purchaser with the condition that the purchaser should remain in possession for seven years without a rise of rent?—Yes, a certain short term of years, I think it was seven.

27,586. That would be a recurring right and whoever took possession of the farm would always, on leaving, have that right of sale to his successor?—Yes.

27,587. Does not that practically come to this, that it means a judicial rent and fixity of tenure, because when you give this recurrent right of free sale on the conditions you speak of it would practically mean that the tenant and his assignees would have fixity of tenure?—He would almost have fixity of tenure because if he were at the end of his term that is fixed if he left the farm and sold his tenant right again it would be for another term of years. But still the landlord would have the right of pre-emption at the end of such term.

Mr. W. E. Bear.
5 July 1894.

27,588. What do you mean by the right of pre-emption?—To purchase the improvements at the market value, whatever they might be worth, if he liked to give as much as anyone else would for them.

27,589. That seems to me to be inconsistent with your principle of free sale; a tenant on wishing to go, I understood you to say, was to have the right of selling his interests in such a manner that the incoming tenant would have the right to remain there for seven years without an increase of rent?—Yes.

27,590. How would the landlord's right of pre-emption affect that?—I mean to say that the landlord might give the same price, the market price, for the improvements and then he could take possession of the farm and let it again.

27,591. Quite so, but then it would be a matter of bidding between the landlord and an outsider?—Yes.

27,592. And whichever of them gave the highest price would be entitled to take the farm?—I suppose so. Of course the difficulty is to ascertain what is the market price.

27,593. The right of pre-emption then would involve the right of putting it up for competition in which the landlord would have the right of bidding against any outsider who might wish to have the farm?—Yes.

27,594. If the landlord gave the highest price he would have it?—Yes.

27,595. If an incoming tenant gave the highest price he would obtain possession of the farm for the seven years with the right of renewal upon the same basis afterwards?—Of course the landlord would be able to disturb him at the end of the term by putting up his rent if he chose unless he appealed against it to the Court of Abitration.

27,596. (*Viscount Cobham.*) Still that would not be a right of preemption?—What I mean by the right of preemption is the right of getting and of taking the farm at the market price.

27,597. (*Chairman.*) But the market price is to be determined by competition outside; I only wish to know exactly what your view is in the matter?—I adopted the scheme of the Farmers' Alliance which we, some of us, worked out with a great deal of trouble and anxiety to do what was fair. As far as I am concerned I do not want fixity of tenure at all, and I do not want judicial rents, if you could avoid it, but I do want free sale, because I do not see any other way of paying for improvements.

27,598. The principle of free sale would seem to involve fixity of tenure and judicial rents?—Yes, but limited fixity of tenure. I do not think it means absolute fixity of tenure.

27,599. I gather from what you said that on every termination of a tenancy the tenant would be entitled to free sale, subject to the conditions that you have referred to?—Yes, but the landlord could buy him out at the end of the term, or at any time, if he liked.

27,600. I gathered from you that he could only buy out subject to this: that some other person might outbid him?—No, there is no necessity, and the tenant is not obliged to go into the market if he likes to accept his landlord's offer.

27,601. Quite so; but if he does not; if he thinks the landlord is not offering him enough, then he would be entitled to go into the market and get somebody else to bid a higher price?—Yes, he would.

27,602. Therefore, although you, in principle, are somewhat opposed to fixity of tenure and judicial rents, does it not practically come to this: that your proposal of free sale does involve those two elements?—It involves the possibility of them, but it does not make them absolutely necessary. In this scheme which I helped to draw up, the tenant and the landlord can agree together; it is only when the landlord attempts to rent him on what he considers his own improvements that he is entitled to go to the Court.

27,603. As I understand it comes to this: that the landlord by agreement with his tenant might buy him out, but if the tenant objects to the price offered by the landlord he would be entitled to get a higher price

Mr. W. E. Bear
5 July 1894.

from some outsider?—Yes, it is only for the sake of getting that principle of the market value.

Valuation.

27,604. (*Mr. Lambert.*) Why do you object to the present system of valuation?—Because I do not think it is possible correctly and fairly to value improvements which have been carried on for years past.

27,605. Why not?—I do not see any way of getting at the value. How is a man possibly to tell that, when you may have been improving your farm gradually.

27,606. Then how is an outsider to tell?—You must take your chance in the market; you must be your own valuer. Every one takes his chance of valuing correctly or not. It is the same with everything else in the market. If you get the market price I think you cannot complain.

27,607. But somebody must value?—The man would form a general estimate; he would perhaps have seen this farm being improved for years under his eyes, and he would say: I should not mind giving so many hundred pounds for the sake of getting that farm. The out-going tenant and he would have an opportunity of bargaining together. The out-going tenant would point out what he had done clearly, and the man who intended to purchase could inquire of the labourers on the farm. There would be plenty of opportunity of getting at the knowledge gradually.

27,608. Cannot valuers get at the same knowledge?—I do not think they would take the trouble if they could: I do not know whether they could.

Fixity of tenure and free sale of improvements.

27,609. (*Chairman.*) Then I gather from you that although in principle you rather dislike free sale and judicial rents, yet that you practically admit that the adoption of free sale would almost inevitably induce the other two principles?—Yes, you must have something of the other two principles.

27,610. It means a continued repetition of the same things does it not?—I would not have fixity of tenure sufficient to keep the landlord out of all power of resuming his land.

27,611. But he is only to resume apparently by agreement with the tenant?—By paying. I think he should have the power of resumption if he can give as much as the tenant can get elsewhere.

27,612. If the tenant is not satisfied with his payment he would have the right to get the higher payment from somebody else?—Yes, if he could get more, but the man must be a solvent man to whom the landlord has no reason to object, on entering his farm.

27,613 (*Mr. Lambert.*) Who would decide that?—The court. There must be a court of arbitration—some sort of arbitrators; you must have what is called a land court—I suppose you may call it a land court, or the county council might appoint arbitrators, or the county court.

27,614. Has your proposal been adopted by any large bodies of tenant farmers?—It was adopted by the Farmers' Alliance, but it was not popular with a great many. I should say that the majority of farmers in this country would be against me.

27,615. It was adopted by the Farmers' Alliance, but not universally?—The public opinion among farmers has grown very much in favour of it since the time when we brought it forward, especially in Lancashire and the north of England, but I do not think they are very clear and logical in some of their statements on the point. I think that the only alternative to free sale is unlimited improvement on the part of the tenant. I would not have any limitation in the way of schedules, and in that case there would be a great hardship to the landlord in having to pay an unlimited sum of money for improvements which he had not sanctioned. Then you have another difficulty; how are you going to prevent the landlord from saying to the tenant, "If you make those improvements I shall turn you out of your farm"? Those are among the reasons which induce me to advocate free sale, because there are so many difficulties in the other system.

27,616. Does not the difficulty mainly arise from the prevalence of the system of yearly tenancies, and that if a system of leases was to prevail the difficulties would not occur?—I do not see how leases could make any difference to them. Do you mean to say that the landlord could not turn the tenant out while he was making improvements?

27,617. Yes?—Of course he could not under a lease, but then English farmers are averse to leases at the present time, and they seem to be getting more and more out of favour with Scotchmen.

Mr. W. E. Bear
5 July 1894.

The Agricultural Holdings Act. The schedules.

27,618. Short of this proposal of free sale, have you any suggestions to make with regard to the amendment of the Agricultural Holdings Act?—Yes, I should abolish the schedules altogether, and let the valuers ascertain as nearly as they could to what extent the farm had been improved. I mean to say that I would not have limiting schedules, and that anything which improved the farm should be paid for.

27,619. Would you leave the arbitrators to determine on a view of the farm, what the value of the improvements effected by the tenants had been?—Yes, and particularly including the gradual improvements.

27,620. Quite irrespective of whether the tenant has laid out more or less money; irrespective of what his actual outlay has been?—I think that is a great fault in the Act. I would not have outlay rule the compensation at all. It is the increase in the value of the farm which should determine the compensation.

27,621. (*Mr. Channing.*) By the fault of the Act, do you not rather mean the fault of the valuers in using the Act?—Yes, I think they have misinterpreted the Act in that respect. It was to be the value to the incoming tenant. Still they have all decided that it should be based on outlay. It is limited by outlay, and it is limited also by the value to the incoming tenant.

Market monopolies.

27,622. What other suggestions have you to make? you have spoken of the reduction of the burdens on land, of the prohibition of gambling, of the prevention of preferential railway rates, of better dealing with dilapidations, and of the reduction of railway charges; I see you have a note as to the abolition of market monopolies, do you consider that a matter of importance?—Yes, as far as I understand it. I see the evil of it in this centralised system of sending everything to London, as for instance fruit, to Covent Garden first, and then letting it be distributed to the smaller towns. I think that is an evil. I suppose there was a great grievance when they were about to open the market near the terminus of the Great Eastern Railway Company and were not allowed to do so because some charter stood in the way. I do not think any market charter ought to stand in the way of opening a market where it is wanted. Then the system of forming rings among the salesmen in the meat market and in the fruit market is an evil which I think the monopoly of markets tends to foster. I think if we could have free trade in markets the rings might be broken up to a great extent. I am told by fruit growers and also by men who send to the meat market, that you are never certain of getting the price your particular meat or fruit makes; you get an average. Of course that is a very unfair system.

Labourers.

27,623. In your investigations into the condition of labourers in the counties that you have named, did you find on the whole that their condition was improved as compared with a few years back?—Yes, they admitted it themselves and their wives all said so.

27,624. Was that mainly owing to the low prices?—Yes, it was mainly owing to the low price of everything they have to buy.

27,625. Could you form an opinion of what they gained on the percentage of their wages?—Through the low prices?

27,626. Yes?—No, it would be a great difficulty all round to form an opinion of that. Of course it depends on the extent to which they spend their earnings in food.

27,627. I suppose food is the main portion of their expenditure?—Yes, no doubt.

27,628. Do you think that they have consumed more meat of late years?—Yes, I think they have a little more; in many counties they certainly have meat oftener than they used to.

27,629. They have meat oftener than they did?—Yes, I think undoubtedly they do in many counties.

27,630. Do you find that their money wages have either been maintained or somewhat increased?—They have not been much increased. In some counties there was a slight increase since the Duke of Richmond's Commission sat, and in others they were about the same.

27,631. Was there anywhere a reduction?—I should think that the men in many cases earned less, because there is a great diminution of their harvest money. No doubt in some cases the men were complaining that their harvest money came to very much less than it used to, partly owing to the decrease in corn growing, and partly to the use of reaping machines.

27,632. Apart from that were the weekly wages reduced?—The ordinary weekly wages where I went were rather raised, they were rather higher than lower.

27,633. And having regard to what they could get for their wages the improvement was considerable?—Yes, no doubt it was considerable.

27,634. Did you find many labourers out of employment?—No.

27,635. Very few would you say?—Very few men out of employment, unless they were considered worthless sort of fellows. Wherever I went it was the testimony of the relieving officers that no steady men were out of employ.

27,636. Did you find a fewer number were being employed generally?—A fewer number were being employed, but then there were a fewer number to be employed.

27,637. They had left the rural districts for the town districts?—Yes, they had; but not to the extent people have been talking about in the way of an exodus. I was rather surprised to find how small it was in some of the districts. Bedfordshire was the worst.

27,638. What should you say was the percentage?—In some cases it was only from 2 per cent. to about 5 per cent. in 20 years, in other cases it was about 15 or 20 per cent. In Bedfordshire I cannot remember now what the percentage was exactly, but I know it is very high in Bedfordshire.

27,639. (*Mr. Lambert.*) Are those figures stated in your reports?—Yes, they are all given.

27,640. (*Chairman.*) Then did you find in those districts that the rents had been largely reduced?—Yes, the rents had been greatly reduced in all the districts I went into.

27,641. Take one of these rural districts where the labourer has derived considerable benefit from the reduction of prices and where his wages are somewhat increased; where the rent has been reduced, and where the farmers' profits have been low; does all that not mean that the labourers get a larger proportion of the produce of the land than they did?—Unquestionably it does, a little larger; but I think that if we had had times of prosperity the condition of the agricultural labourer would have been even much better than it is, if we had had prosperous times for the last 10 years.

27,642. Then he might lose by the raising of prices?—I do not think so. I think if wheat had been at a moderate price, the labourer would have been much better off than he is now.

27,643. Do you think that his wages would have increased still more?—I think they would have increased very greatly, because the demand for men would have been very much larger than it is. Wherever I went I found that the farmers were cutting down their labour expenses to the utmost possible extent, they were not doing things that they would have done years ago; they were economising in the meanest possible way; in what would have been considered a mean and disreputable way in years gone by, and I think the men have very much less piece work than they used to have.

Market rambling.

27,644. (*Mr. Lambert.*) You, I believe, have an idea that the system of options has a considerable effect upon the price of corn?—Yes, I think so.

27,645. Is it the fact that the price of corn for future delivery is larger or higher than it is for present delivery?—Yes, there is a little difference, but there is always a difference to cover what they call carrying charges. Of course with fictitious grain that is a mere pretence, but in the sales of actual corn for future delivery it was necessary to allow the holder a certain sum of money to cover the expenses of holding this wheat in the granary.

27,646. But with the fictitious wheat, of course there is no necessity for carrying charges?—There is really no necessity for it, but they have adopted it.

27,647. Why should the purchaser pay those carrying charges?—It has been the custom always to allow them. Of course if he did not allow it the other man would have to ask for more, I suppose, to cover the risk. These carrying charges are a great advantage to the man who sells. They keep on decreasing as the contract matures, so that when the contract comes to an end they disappear altogether.

27,648. Why do you think this system of selling wheat has any effect upon price?—In the first place because it creates an enormous fictitious demand and swamps the market with fictitious wheat, because all the markets in America which quote prices at all are option markets and the prices of spot wheat actually depend on the prices of options.

27,649. Why should it have an effect upon the raising or lowering of the price?—I think if you swamp the market with anything the natural result is to have a fall in the market.

27,650. If you swamp it with something naturally, but not anything unnatural or of a flimsy nature?—If you swamp the market with offers of fictitious wheat it cannot be very readily distinguished from real wheat. Nominally you are bound to deliver according to the rule of the exchanges; or rather you are bound to contemplate delivery in every sale, so that it is difficult to say whether a man is selling for actual forward sale or to know when you see market reports whether he is selling options.

27,651. But is it not a fact that for every seller there must be a buyer?—Yes, of course there must.

27,652. Then why does it have the effect of raising or lowering prices when you set one against the other?—I think if you create an over supply it does not matter that you have a buyer for everything. It still lowers the price. There is a buyer for everything, but it is a buyer at a lower price.

27,653. You do not increase the supply; it is only a bet on this article?—You increase the nominal supply. You flood the markets with offers of wheat, and I maintain that if you flood the markets with offers of wheat, and offers of wheat which actually fix prices, you lower prices. The prices of real wheat are really fixed by the option prices in America.

27,654. Where is the great option market in America?—All the Board of Trade markets are option markets in America, but the New York and Chicago markets are the chief ones.

27,655. Is there much trade in options done in Russia?—I do not know. I understood that had been prohibited in Russia. I do not think there is much done in any European country.

27,656. You think the system of options tends to depress prices?—I feel confident it does, and all the American farmers seem to be of the same opinion.

27,657. How is it that the price in Russia, where there is no option, is lower than the price in Chicago, where there are options?—Of course it depends a great deal upon the cheapness of conveying the corn to market.

27,658. I mean the prices for delivery here?—The prices in Russia are lower?

27,659. Yes?—The interior of Russia, I presume. That would be because of the expense of bringing it to the seaboard.

27,660. I mean to say on the market here?—I do not understand.

27,661. The prices quoted for delivery here from Russia are lower than they are for delivery from Chicago?—The prices of Russian wheat?

27,662. Yes?—The quality might be inferior.

27,663. Do you think there is so much difference in the quality as the difference in the quotation?—I had not noticed the particular difference in the quotations of Russian and American wheat.

27,664. Is it not a fact, too, that if a man sells wheat, he would naturally hold a certain amount to cover his sale? He would tend to keep back a certain amount of wheat from going on the market?—No; I do not think the option system tends to keep the wheat from going on the markets. It seems to have tended rather to induce the farmers to sell out directly after harvest more than ever they did before.

27,665. That would be real wheat?—Yes.

Mr. W. E. Bear.
5 July 1894.

27,666. But we are talking of fictitious wheat?—I do not quite see the drift of your question.

27,667. If a man sells options, is it not probable that he will keep a certain amount of real wheat to cover his transaction?—No, I do not think he does. I do not think he takes that trouble at all, because it is so thoroughly understood that there will be no delivery required. I am told that it does not take place in 99 cases out of a hundred.

27,668. That is quite true, and therefore I wanted to know how it affected price?—I think it also affects the price by the great lack of security in the markets which it induces. Of course, if you disturb the sense of security in a market you make a weak market, and a weak market is a falling market, as a rule.

27,669. Are not the lower prices owing to the greater power, the cheaper prices, and the larger amount of wheat being brought into cultivation?—Unquestionably; over supply is the chief cause of lower prices.

27,670. I presume if the supply were restricted below the demand, prices would go up again notwithstanding the option system?—Yes, in spite of the option men. They could not possibly prevent it and a great many of the men who are now bears would become bulls and try to force prices up all they could.

27,671. I suppose there must be a bull where there is a bear, and a bear where there is a bull?—Yes; but I think if you compare the former system with the present one you will see that in the former system every man who bought wheat, as soon as he bought wheat was anxious to see it go up, and as far as he could influence the market at all he would help to send the price up. But nowadays when a man buys wheat he sells an option against it, and then it may be to his advantage to have the price go down more than it is to have the price go up. So comparing the system when there were no options with the system when there are options it is absolutely demonstrable that the tendency of the new system is rather to send prices down, because all the men who were interested in the old times in sending prices up are now, or a great many of them at least, just as much interested in sending them down.

27,672. But then also there is an equal number of people wanting to send prices up?—No, I do not think so.

27,673. (*Mr. Giffen.*) You said that when a man buys wheat now he sells an option against it. Do you not mean that he buys an option?—No, he sells an option against it. If a man buys a hundred thousand bushels of wheat, he sells against it by way of security.

27,674. He sells against it, I understand, but he does not sell an option?—Yes he sells an option against his purchase.

27,675. He rather buys an option to put the wheat? Is that not the right way to put it?—No, he would sell, if he wanted exactly to balance his risks, if he had bought 100,000 bushels of wheat he would sell 100,000 bushels of options; then if the price fell on what he bought he would lose on that, but he would gain on what he had sold in options.

27,676. Would he not sell out and out and not sell an option? The equivalent of buying wheat to my mind, is that he should purchase an option to sell or sell it out and out; but he does not sell an option, and I wish to understand what it is that he does?—That is what he does; he does sell an option. If he buys 100,000 bushels of wheat and wishes exactly to balance his risk, if he can sell an option at the exact price at which he has bought, he neither gains nor loses.

27,677. Of course, if he sells an option and he has not neutralized his purchase at all, he is entering into a new engagement of a very difficult kind?—On his 100,000 bushels of wheat he has got to pay, we will say, 100,000 half dollars, and on the option that he sells he has got to take 100,000 half dollars; that is to say, he would have, if it were a case of delivery.

27,678. What is it that he sells when he sells an option, is it a privilege to somebody else to take the wheat from him?—No.

27,679. But that somebody else may not take it?—No, an option may be at the buyer's or the seller's privilege of delivery, if there were any delivery; but an option that is sold on London by importers is merely an agreement to pay the differences in price; so really in selling this option he merely makes an insurance that any fall in price which takes place in the real wheat that he has bought will be covered.

Mr. W. Bear.
5 July 1894.

27,680. What is it that he sells, what is the engagement?—Supposing he had bought 100,000 bushels of wheat which he expected to arrive in September, he goes and sells a September option against that wheat as a security. He sells 100,000. We will say that he wishes exactly to cover his risk; then he sells 100,000 bushels of wheat at the highest price he can get, to be delivered (nominally) in September. When September comes—I need not go into the intermediate settlements which occur in the clearing house day after day—if the prices have gone down 5 cents a bushel he loses 5 cents a bushel on the wheat he has purchased which he has just got come into the docks; but he gains 5 cents a bushel on the option that he has sold, and he takes that difference, supposing he sold at the same price at which he bought his wheat.

27,681. I am rather wishing to get at the explanation of the technical terms, and I think from the description that you have given now, that he sells out and out; that he does not sell an option, and that is the explanation of the technical phrase which I wish to have?—He sells nominally 100,000 bushels of wheat.

27,682. He sells out and out; he contracts to deliver so many bushels?—No, he does not mean to deliver at all, he only means to take the difference.

27,683. But that is the contract?—Yes, that is the contract.

27,684. It is an out and out sale therefore, and not an option?—It is what they call an option or a future; it is really a future, and the old term "option" no doubt ought to be discarded altogether now. In the old times it used to be optional on the buyer's or seller's part to deliver or not, but now, according to the rules which are made in the exchanges, you are nominally bound to contemplate delivery, only everyone winks at it when you do not deliver.

27,685. Have you any options properly speaking still?—There is no distinction as far as I can see between an option and a future now; that is, all options are really futures.

27,686. Then you are different from the Stock Exchange where you can still deal in options?—I do not know anything about the usages of the Stock Exchange. I have been told there was nothing exactly equivalent to options in wheat on the Stock Exchange.

27,687. (*Mr. Lambert.*) May I ask you one more question of fact on this matter? There has been some attempt at passing an Option Bill through the American Legislature, has there not?—Yes, the Anti-Option Bill was passed through the Senate last year.

27,688. What is the effect of that?—It has not become law; it was passed last year through both Houses really, only it was sent back as amended by the Senate to the other House and when it got back there was no time to get it through owing to the obstruction being too great. This year it has been passed by the House of Representatives, and it has now gone to the Senate, but it is supposed there that there is bribery. I am told that hundreds and thousands of pounds have been spent to obstruct it.

27,689. When it passed the House of Representatives was it not the fact that the price of wheat in Chicago fell?—Of course I cannot tell what effect that would have, it would no doubt create a great deal of unsettlement to begin with, and would unsettle the markets possibly.

Judicial rents.

27,690. Are you in favour of judicial rents?—No, not as a general rule, except so far as they are necessary to secure free sale.

27,691. Which do you consider the greater evil of the two, or rather I will put it the lesser benefit, free sale or judicial rent?—I think free sale is the only thing that I care to get; I would only use judicial rents as far as it is necessary to secure free sale.

Free sale of improvements.

27,692. If you put up improvements to competition would that not tend to increase the competition for farms?—No, I do not think so, because a man must have a certain amount of capital in order to take a farm and to buy the tenant right. I should think, therefore, that it would rather diminish competition for farms.

27,693. But you would allow the landlord no option in saying as to whether a man should have the highest bidder for those improvements?—I would allow him to object to any man who was, from any point of view, objectionable.

Mr. W. E. Bear.
5 July 1894.

27,694. What tribunal would you have to decide that?—I do not know that I have exactly fixed on a tribunal; of course there would have to be a kind of Land Court in each county, before whom such disputes should be settled.

27,695. I want you to go a little further; would you give the landlord the right of objecting because of the excessive price paid?—No, I do not think I should.

27,696. If a man bid to any amount, even if it were largely in excess of the value, would you give the landlord the right of objecting?—No, I do not see what difference it would make to the landlord.

Compensation for disturbance.

27,697. Would you be in favour of compensation for the capricious disturbance of a tenant by a land owner, presuming that a tenant was making improvements which were for the benefit of the holding and the landlord turned him out?—Yes, I would in that case, if you do not have free sale. Under free sale a landlord could not turn a tenant out very well.

27,698. I am suggesting an alternative plan?—Yes, I think a tenant ought not to be turned out because he was making improvements against the wish of his landlord; in fact, I would not allow it to be done. If you do not have free sale, you must have some scheme by which a man shall be entitled to improve to the utmost of his desires without being turned out for doing so.

27,699. If he is turned out would you give him compensation for that disturbance?—If you are going to allow him to be turned out, I think I should; but I have always opposed compensation for disturbance. It is unnecessary if you have a thoroughly good tenant right system.

27,700. (*Mr. Channing.*) But you must have either that or fixity of tenure, must you not?—I think perhaps you must.

Market gambling.

27,701. (*Captain Owen Thomas.*) I suppose you attribute the fall in prices of wheat to gambling in futures and options?—To some extent.

27,702. To a great extent?—I think that over production has been the chief cause. We have had two enormous crops in succession in America, followed by one average crop; that accounts for the great fall in wheat which has taken place in the last three years; but I think options have tended also to send the price down very much further than it would otherwise have gone.

Price of meat.

27,703. To what do you attribute the fall in the price of beef?—I think the temporary fall in price which took place about a year or two years ago, or three years ago, it began three years ago, was mainly caused, in the first place, by a prolonged winter, which forced farmers to sell at any price. In the next year there was a very similar season, last year that is to say, which forced them to sell again—the drought. In the first instance a prolonged winter, which prevented the spring feed from growing; in the second place it was a drought which killed the feed, or prevented it from growing. I think these were the two causes which sent down the prices to a certain extent. Of course there were the increased imports from America as well.

Fall in prices.

27,704. Do you not think foreign competition was the main reason why prices have gone down very much?—Yes, I think that is the main reason of the steady fall in prices, but the exceptional fall which took place between 1892 and 1893 was caused mainly I think by the seasons preventing the growth of feed.

27,705. Do you know what the present price of wheat is?—The average last week was 27*s.* 1*d.*, I think.

Cost of production abroad.

27,706. Would you say that that is below the cost of production in foreign countries?—Yes, unquestionably I think it is. The Department of Agriculture published a statement the other day to the effect that 25,000 American farmers sent in statements of the cost of wheat growing, and the Department of Agriculture published a summary which showed that the cost of producing wheat was nearly half as much again as the present price.

The gold premium in Argentina.

27,707. I saw a statement in the *Standard*, I think, the other day, to the effect that the South American farmers, the Argentine farmers, could send wheat here for 22*s.* 6*d.* a quarter?—With their gold premium of 300 per cent. I think it is very likely they can.

27,708. (*Mr. Giffen.*) Is that not the price of gold in paper?—Yes, but they sell wheat at gold prices, they buy land at paper prices and pay wages at paper prices; everything that they spend in the country I am told is spent at paper prices; but they sell their wheat at gold prices with the 300 premium on the gold.

Mr. W. E. Bear.
5 July 1894.

27,709. Is not the premium of 300 the price of gold in paper and does it not include more than the premium, I am merely wishing to get exactly at the facts?—I suppose that gold being at a premium of 300 per cent. means that 100 dollars in gold would buy 300 dollars in Mexican currency. Would not that be the meaning of a gold premium?

27,710. I am merely desiring to have the expression quite right, because I think the dealing is in paper, and it means, as far as I can grasp, that if you give 300 dollars of paper for 100 dollars of gold or something of that kind; I wish to know what it means exactly?—That is what I understand the gold premium to mean, if it does not mean more than that. I see that the dollar is valued here in Mr. Gastrell's last report at 1*s.* and I suppose the original value was at least 4*s.*; so that it looks as if 300 per cent. premium meant 300 in addition to the actual balance in values.

27,711. (*Capt. Owen Thomas.*) Is it not a blessing to the community that they should have cheap bread?—Unquestionably, but I think they might have cheap bread if wheat were 50*s.* a quarter.

Wheat growing in America.

27,712. As long as it is not sold under the cost of production, I mean to say in those countries where you say their currency has something to do with it, I do not see that there is much harm in selling for 25*s.*?—I do not think that anyone ought to wish that the man who tills the soil should have too little in exchange for his labour.

27,713. If it can be produced in other countries for that price I do not see why we should have a fictitious value placed on it?—I am not arguing in favour of it; I am only arguing for the removal of artificial conditions which enable people to have an advantage in one country which those in another have not.

27,714. Do you think farmers would go on producing wheat if it did not pay them?—They are not going on to the extent they did; they are growing less and less, and they are growing less in America now.

27,715. Do you not think that supply and demand will have something to do with it later on?—I think ultimately, in the long run, the thing will right itself; unfortunately the long run means a very long time sometimes and it means the ruin of hundreds and thousands of farmers in the mean time. I think people will grow wheat until they are nearly ruined; in all new countries of course it is a ready-money crop and it is the only thing they can be certain of selling.

27,716. (*Mr. Channing.*) I think you said that the American area of wheat was not increasing?—No, it is decreasing considerably now.

27,717. The prices of wheat in America have gone down enormously, have they not?—Yes.

27,718. What is the price of wheat now as compared with the price 20 years ago?—I suppose compared with even 10 years ago it is not much more than half. It has been down to a few cents over 50 or a half a dollar a bushel in New York this year, but it used to be said that a farmer could not grow wheat at less than a dollar a bushel.

27,719. I have referred to an interesting paper of yours, read last year, on agricultural distress and its remedy; there you state the money value of the crop per acre of wheat at 33*s.* 6*d.* in 1891, I think is the year, as compared with 60*s.* 6*d.* in 1872; can you tell me on that whether it has still further depreciated in America?—Yes, the farm price has been much less than 33*s.* an acre in one or two years. This last year it must have been the lowest of all. I suppose my figures that you are quoting related to 1892.

27,720. 1891 I think?—1891 was a year of comparitively high prices; in 1892 the farm value must have been less, but I cannot remember now. I have all the figures at home. I should think it would be about 25*s.* an acre last year.

27,721. In this paper you expressed some confidence that this question of prices will ultimately adjust itself, based on the relation of food production to population; do you adhere to that now, after that last year's experience?—Yes, I believe that in time the people will be so disgusted by the prices that they will go on growing less and less in countries like America, until the

Mr. W. E. Bear.

5 July 1894.

supply is barely sufficient for the demand, and then there will be a rise.

27,722. And in the meantime the population is rapidly increasing?—The population is rapidly increasing. I agree with Mr. Wood-Davis who has attempted to demonstrate that population will encroach upon wheat gradually and that we must have much higher prices a few years hence, but I think that in the meantime the impediments to fair play should be removed.

Free sale of produce.

27,723. With regard to the value of an acre of wheat in England, I suppose it would be fair to say that the value of an acre of wheat now was scarcely more than one-half what it was in 1879, the worst year on record; is that the case?—Yes, I suppose the price was nearly double in 1879 what it is now.

27,724. Does that increase in your opinion, the desirability of giving farmers either by agreement or by some statutory right the right of free sale of straw and hay and other produce?—Yes, it is perfectly ridiculous to compel farmers to consume hay and straw when they can get four times or sometimes eight times the manurial value by selling them in the market.

Loss on value of produce and reduction of rent.

27,725. At what would you put the total loss to agriculturalists of the gross value of produce in the last 20 years?—I could not say.

27,726. In this paper you put the gross value at 96 millions sterling, equal to 2*l.* an acre, would you adopt that as your opinion now?—I should think the returns would average quite 2*l.* an acre less than they used to.

27,727. The farmer, remember, has low rents to pay, and he pays less for labour and less for the articles he buys?—Yes, he spends less in labour although paying about the same wages.

27,728. I think you said something about rents; is it your opinion that the rents generally prevailing to-day are still greater than they were 40 years ago?—I think they must have pretty well got down. You see in some parts of the country they are much higher than they were then, in other parts I should think they are lower than they were 40 years ago. They are much higher in the north of England, as in Lancashire, Yorkshire, and Northumberland; and they are much lower than they were 40 years ago in Essex I should think and in Hampshire.

27,729. The income-tax returns show that the landlords have 12 millions sterling less than in 1879; I suppose you would add to that the remissions of rent, which would increase considerably the loss to the landlords?—They are allowed for by the Commissioners in the income-tax returns; but it is more than 12 millions sterling now; that figure was arrived at two years ago, I think.

27,730. The loss to the landlords would now be considerably more than that?—Yes; I do not suppose the remissions are all taken account of.

27,731. Taking this figure of yours as approximately correct, of 96 millions sterling, or 2*l.* an acre, have you formed any opinion as to what share in the loss the tenant farmer has?—Of course anything of that sort is nothing more than a guess, and I have always been rather against publishing guesses in the way of statistics. A great many calculations have been made, and in that paper which I referred to some of those calculations, and said that no one could possibly tell at all exactly, but that I thought there was very good reason to believe that the loss was as much as 2*l.* an acre on the cultivated area.

27,732. Do you think the farmers have been enabled to obtain reductions of rent sufficiently promptly to make the sharing of the loss in agriculture fair as regards the tenant farmer?—No, I do not think they have. Many of the old tenants were not allowed any reductions in rent until they were ruined, and then the reductions were given to new men. I think it has been a great complaint in many counties that the reductions were not made soon enough, and that the farmers lost their capital before the reductions came to help them.

27,733. Has the farmer, in giving notice to quit, in your opinion, a sufficient remedy to enable him to obtain a reduction of rent?—I do not think that his notice to quit has been any incentive, until quite recently, to the landlord to give him what he wants in reduction of rent.

27,734. The notice to quit is in bad times in the case of improving farmers, almost a more serious thing than in good times, is it not?—Yes, very much.

27,735. He has sunk his capital, and therefore has more motive to remain and try to get something out of it?—Yes.

Mr. W. E. Bear.

5 July 1894.

27,736. I think you said that in your opinion many farmers not supplied with the concessions which have been made by good landlords have been bled to death by the exaction of rents which could only be paid out of capital; greatly to the injury of their farms and the ultimate loss of their landlords; do you adhere to that statement?—Yes. During the last few years the reductions have been almost universal, and in many cases land is now let at an extremely low rent.

Compensation for improvements.

27,737. I have put these questions to you because I want to ask whether you do not attach some importance as regards the failure of agriculture and the loss of farmers' capital to the refusal of the suggestions made in 1883, when the Agricultural Holdings Act was discussed, that the sitting tenant when quitting should have the right to have his improvements considered in any alteration of the terms of the tenancy?—I do not know whether it has had that effect because I do not think rents have been raised since 1883. There has been no raising of rents as a rule on anything, so that they could not be raised on the tenants' improvements.

27,738. If a tenant when quitting a farm could be compensated on his improvements on any change of the terms of the tenancy, or on his tenancy coming to an end, say in the case of a leaseholder, would he not be in a much stronger position with regard to obtaining an adequate reduction?—Apart from the disturbance of rent I cannot see any occasion for a man to be compensated in the middle of his term. I have never been able to see that.

27,739. Then you do not adopt Sir James Caird's views which were advanced in 1883?—I never could see any great reason for compensating the sitting tenant unless the rent was to be raised, and then I say that the landlord, before he should be allowed to raise the rent, should pay compensation, otherwise I do not see why a man should not be allowed to realise the results of his own improvements.

27,740. Do you not think it would have been desirable, and that it would have diminished the agricultural depression, to have given an improving tenant a right to have his improvements considered in obtaining a reduction of his rent?—Yes, I think his improvements should fairly be considered. I think there is a fair ground to value the improvement if the landlord demands an increase or the tenants demands a decrease.

27,741. In the case of a farm, the value of which has been kept up by the improvements of a tenant, whereas other farms in the neighbourhood have gone down, would it not be fair for the improving tenant to ask to have his improvements considered, and the rent reduced in proportion to that?—Yes, I think it would be quite fair.

27,742. Otherwise would he not be rented on his improvements, which is as much, although rents were falling generally, as he would be if rents were being raised generally?—Unquestionably he would, and in many cases no doubt a man has had his rent kept up, mainly through his own improvements.

Freedom of improvement.

27,743. There are one or two points about the proposals which I do not think you have been asked questions about in your brief. Have you been asked whether there should be any restriction upon the liberty of improving land?—No, I have not been asked that question.

27,744. Would you give the tenant a perfectly free hand in improving land?—Yes, I think it is obviously in restraint of agriculture to prevent the improvement of land, and I think that if the landlord and tenant system is to be kept up, it should not be allowed to be a bar to agricultural improvement.

27,745. You would not give the landlord any right to refuse?—No, I would not; if the landlord objects to having to pay the capital value of the annual improvement added to his estate, I say let him accept free sale, and let the tenant get what he can.

27,746. Do I correctly understand your suggestion to be that this liberty of improving should be confined to the temporary improvements in the third part of the first schedule?—No.

27,747. Or that it should have regard to building and the making of gardens and first class improvements?—I think it is desirable that the landlord should erect the

Mr. W. E. Bear. July 1894.

buildings, but I would not limit the tenant. He must take the risk, and if he erect a building which is not suitable for the farm then the valuer would not allow him anything to speak of for it. For instance, if a man chose to build an extravagant brick and slate building for a cart-shed, costing about twice as much as a useful one would, the valuer would certainly be justified in not allowing more than half the cost.

27,748. Would you allow the tenant to do what he liked in that way, and rely entirely upon the decision of the valuer as to whether it was an improvement?—Yes.

27,749. Have you considered the suggestion in the Bill that I have had before Parliament, and in the Welsh Bill, and also in a Scotch Land Tenure Bill, several Bills that have been before Parliament, that in case the landlord refuses to carry out, or to allow a tenant to carry out, first class improvements, there should be a reference as to whether it is an improvement suitable to the holding?—I have noticed that.

27,750. Do you approve of that?—Yes, I think it is a very good introduction.

27,751. Would you approve of that, rather than having what you have just stated to be your own view, that is that the question of the suitability should be tried before the improvement is executed?—No, I should prefer my own, but I think that the other is a great improvement on the existing state of affairs. I should prefer to leave the improvement perfectly open and free.

27,752. I do not know whether you have taken any interest in the Market Gardener's Compensation Bill, which has just passed through the Standing Committee on trade; have you followed that at all?—Yes.

27,753. Are you aware that the principle which I have just put to you, that there should be a reference in case of refusal, was adopted by the Standing Committee in regard to that Bill?—Yes.

27,754. Do you approve of that?—Yes, I approve of that as far as it goes, but I would prefer it to go still further.

27,755. You would prefer perfect freedom with power to sell, the landlord to be on the same footing as any other purchaser of the improvements?—Yes, I should prefer that plan. But I understood your question to be apart from free sale only, on the valuation system; I say if the Government or Parliament will not grant free sale to tenant farmers, I think they ought to grant them perfect liberty to improve with a perfect claim for the value of their improvements, so far as those improvements are suitable to the holding.

27,756. With power to the landlord to obtain a reference on the point of suitability?—Yes, afterwards.

27,757. (*Viscount Cobham.*) And not on the point of whether it was an injury to the estate generally?—Of course I would make a man pay compensation if he injured the estate generally.

27,758. (*Mr. Channing.*) In case a tenant was visibly carrying out what he supposed to be an improvement but what was really a detriment to the holding for the purpose for which it was let, would you allow the landlord to step in and obtain an injunction against that?—I should not object to that at all; it would save a lot of trouble. Still my idea is that there should be perfect freedom of improvement, and that the tenant should take the risk, either by free sale or by valuation of what the improvement proves to be worth to an ordinary incoming tenant. If a tenant engages in a special industry and carries out improvements only suitable for that special industry, and the farm is not likely to be let to another tenant who would carry on the same special industry, I think the tenant would have to lose the improvements to a great extent.

The Agricultural Holdings Act. The schedules.

27,759. I understand that if you substitute for the existing Agricultural Holdings Act another Agricultural Holdings Act based on the principle of valuation you would strike out the schedules from such an Act?—Yes, I should certainly have no limiting schedules.

27,760. Would you give this freedom to improvements which you describe and then valuation of the whole added value or the whole decreased value to be paid on either side, without schedules?—It would be a very good plan to have it a rule when a man goes out of a farm that every field should be examined and its condition described in a schedule for the guidance of the valuer who next has to ascertain the improvement or deterioration of the farm.

27,761. Have you considered the report of the committee appointed by the Central Chamber to consider this question?—I was away in Switzerland when it was being discussed.

Mr. W. E. Bear. 5 July 1894.

27,762. Are you aware that they proposed very materially to alter the schedules as regards the tenant and that they also suggested a schedule of dilapidations for the landlord?—Yes, and I am quite in favour of that. In the Farmers' Alliance Bill the landlord was protected against deteriorations, and he had the power to apply to the court for an injunction to restrain a man, and even to turn him out in an extreme case.

27,763. That is, if you have schedules on the one side, you think it would be better to have schedules on the other?—Yes, I do.

Landlord's claim for dilapidations.

27,764. Do you think it would be also fair to give a landlord the right, supposing you had an Act of that kind passed, not your own Free Sale Act, but another Act on the valuation principle, to set the Act in motion, and are you aware under the Agricultural Holdings Act he has not that power?—I do not see why the landlord wanted it, because the landlord had the power before the Agricultural Holdings Act was passed. The landlord has always had the right to claim for dilapidations, and he did not want to have any Agricultural Holdings Act at all, as far as the dilapidations go.

27,765. Then you do not attach any importance to that?—I do not, because I say the landlord always had the right, and has it independently of the Agricultural Holdings Act. Of course he has it in a civil action only, and in this case he would get it before an arbitration court, so that it would be an advantage from that point of view.

Court of arbitration.

27,766. Would you state to the Commission what you suggested in the Farmers' Alliance Bill, and what you think is the best suggestion, supposing such a proposal were ever adopted for the tribunal to settle questions of rent, and so on?—The Farmers' Alliance was hampered by there being no county council then; I have no doubt if the Farmers' Alliance Bill was being drawn now the county councils would be instructed to appoint arbitrators to sit as a land court.

27,767. Was it a suggestion of the Farmers' Alliance Bill that the county court judge should sit with assessors appointed by the landlord in his interest and also appointed by the tenant in his interest?—It was left to the county court to a great extent, I see, in the alternative Bill.

Free sale of improvements.

27,768. The alternative Bill is the Bill I am familiar with?—The first Bill was for free sale only, but the second Bill had the alternative of valuation or free sale, and the landlord could choose which he liked.

27,769. In the second proposal, which I remember best, I think the landlord had the right, and I think this will answer one of the questions the Chairman put to you, to insist upon the tenant going out under the principle of compensation by valuation instead of by free sale?—Yes.

27,770. In case the tenant wished to sell his holding the landlord might say, you must come out under the principle of valuation. I think that was the principle of it, was it not?—Yes, in this alternative Bill the landlord had the choice of paying the tenant compensation, or of letting him get what he could upon the market.

27,771. (*Viscount Cobham.*) Was this your own opinion?—That was in the Bill of the Farmers' Alliance. My own opinion was in favour of free sale, but it was over-ruled by the unpopularity of free sale at the time, and we were induced to adopt the alternative; but I am not giving that as my opinion.

27,772. (*Mr. Channing.*) You prefer free sale?—Yes.

27,773. Have you considered the Land Tenure, (England) Bill, which was before Parliament last session? I mean Mr. William Smith's Bill?—I remember reading it at the time but I have not borne it in mind much.

27,774. You have not considered it carefully?—I cannot say that I have, lately; I almost forget what it was now; I do not think I quite agreed with it.

The law of distraint.

27,775. Have you a strong opinion as to the law of distress?—Yes, I have always been strongly in favour of the repeal of the law of distress.

Mr. W. E. Bear.
5 July 1894.

27,776. Under present circumstances?—Under present circumstances it has not been a crying evil, because it has enabled a good many farmers, perhaps, to hold on who otherwise would have been turned out. But I think it is wrong; I think it is an injustice to other creditors, and I think in times past it has done a great deal to enhance rents by giving the landlords a security which they ought not to have.

Credit banks.

27,777. You have followed, doubtless, the exposure of the system of usury under which a great many farmers have suffered?—Yes, I should like to see agricultural credit banks established for that reason.

27,778. One great necessity of agriculture is the further application of capital to holdings in the way of improvements and so on, is it not; land is in great want of additional capital being applied to it in order to increase its productive power?—Yes, of course the tendency in recent years has been to cut down expenses in every possible way, instead of spending money on land.

27,779. (*Viscount Cobham.*) What class of money-lenders are you referring to; have not tenant farmers banking accounts as a rule?—There are a great many farmers who have got beyond the credit of the banks and have got into difficulties as I see by some revelations which were made in the *Pall Mall Gazette*, I believe through information given by the Secretary of the Association I am connected with for establishing agricultural credit banks.

27,780. The ordinary banks do not charge usurious interest, do they?—No, the ordinary banks do not, but there are some which advertise. The number of advertisements of loans by these usurers in the local papers, the country papers, is surprising. I have never noticed it before, but I had a number of cuttings sent me from different papers.

27,781. Do you think a man with fair credit would fall into the trap?—No; of course it is the men who have lost their credit who fall into the trap, men who have had money from the banks as far as they can, and possibly lost it, or at any rate not being able to repay it, and who cannot get any more. Those I think go to these money-lenders.

27,782. (*Mr. Channing.*) The fact that there are these columns of advertisements in the agricultural country papers shows that they must be doing some business?—It shows that they must be doing a tremendous business.

27,783. Do you not think in future that agriculture will be efit by the tenants themselves executing more improvements?—Yes, I believe that the depression has been made worse by the loss of the farmers' capital, and by their withholding capital as far as possible from the land because of the fear of losing money. I believe that in many farms that I have seen the state of affairs is much worse than it would have been if the farms had been kept up in better condition.

27,784. Therefore you would wish to encourage the formation of agricultural banks or loan societies on the lines suggested by the association you are connected with?—Yes.

27,785. You think that would be a benefit to tenant farmers?—I think it would be a benefit. I do not expect to see it do the good in this country that it has done on the Continent, because we have not the large number of small tenants who are in the hands of usurers that they had in other countries, but I still think it would do good because I believe that thousands of farmers are really in the hands of the dealers to a great extent. The stock that they have on their farm is not their own; it belongs to the dealers. At any rate if it is nominally theirs it is put in by the dealers at a price which they fix pretty well themselves and may be taken back again perhaps at a price which they fix again themselves. I think there is an immense deal of that going on, which is very bad for the farmers. Agricultural credit banks would be very useful in lending money to men who wanted to buy stock.

27,786. I believe you have a very strong opinion about railway charges?—Yes; I think they are abominable.

Railway rates.

27,787. I think you have expressed an opinion that you would go so far as to nationalise the railways if there were no other means of dealing with these charges?—If there were no other means of bringing down railway rates, I should like to see the railways nationalised.

27,788. Have you any opinion about forming cheap tribunals to decide questions between traders and the companies in the localities where the traders reside?—I think there certainly should be a cheap tribunal whether it needs to be localised or not.

Mr. W. E. Bear.
5 July 1894.

27,789. Is it not the fact that last year the poorest traders have paid the increased charges in cash, and therefore have not been in the position to withhold part of the charges as the large traders have done?—I think very likely it has been so. I think it is a scandalous thing that the movement in favour of fair railway rates, which was started for the benefit of the customers of railway companies, should have been allowed by Parliament to be turned into an engine of further oppression, because it seems to be the general opinion of traders and farmers that the railway rates now are rather worse than they were before the agitation commenced, that is taking everything all round, for there has been a reduction in some cases.

27,790. The big traders have been able to protect themselves by making deductions from their demands, but these small men have not; would that not be a reason in your opinion for giving them some local means of getting back the overcharges?—That is a thing I have never thought about. It certainly seems to be reasonable that there should be a cheap tribunal for small people. I should think it would be a good thing to have one which would visit different parts of the country.

Market monopolies.

27,791. There is one point in your brief that I should like to ask you if you have anything to say about. It refers to markets. Have you any suggestion to make as to what should be done with regard to the markets?—I should allow a market to be established by any company or body of men, wherever they chose to have it; I do not see why there should not be free trade in markets, and I would not pay any compensation to those who have existing charters.

Butter making.

27,792. You spoke about the great improvement in butter making, owing to the teaching in butter making which has come during the last few years; do you think that teaching has had any effect yet in giving the English farmers more command of the butter markets?—Yes

27,793. Or do you think that the effect will only be in the future?—It has had an effect in Ireland distinctly; you see it more clearly in Ireland because they are associated together in factories which Mr. Horace Plunkett has helped to establish. There is an universal testimony in Ireland that the quality of butter has been improved, and that the prices realised by the small farmers have been better than they used to be.

27,794. Is not one of the real difficulties of the English farmer in getting hold of the butter market in England now, this thorough organisation of the foreign import trade?—Yes, I have no doubt the foreigners have got a great hold, which it would be difficult to disturb.

27,795. They bring in masses of butter all turned out to sample in certain forms and easy to handle?—Yes.

27,796. And the English farmer is left isolated?—The Danes have gained the confidence of the retail traders there is no doubt, and the English farmers cannot possibly do it unless they adopt the factory system; they cannot send out a uniform article otherwise.

27,797. Would you leave the introduction of organisation in the factory system or in any other way to private enterprise, like Mr. Plunkett's, or do you think the State could do anything useful in that direction?—I do not see that the State wants to interfere with the business of farming. I think the tenant farmers should have the common sense to combine, as the Swiss have done. The Swiss have a factory in nearly every village in some parts of their country, and little men with five or ten acres of land help each other to make first-class cheeses by means of their united factories.

27,798. And there it is not done by the State?—No. There they simply take the entire proceeds when the cheese is sold.

27,799. Another difficulty of the English farmer is the utter failure of the Acts to prevent the fraud in butter, is it not?—Yes, the Margarine Act is undoubtedly a thorough failure.

Mr. W. E. Bear.
5 July 1894.

27,800. You expressed an opinion as to the incidence of the land tax, that it might be used in some way to relieve the pressure in the agricultural districts; will you say what you meant by that?—I think there should be an easy means of redeeming both the tithe and land tax in order to place the land more on the same footing with land in countries where the farmers compete with British farmers.

Tithe and land tax.

Market monopolies.

27,801. (*Mr Dalton.*) I think you say that you would give no compensation to the present owners of market rights; would you say why?—They have enjoyed a monopoly for a long time, but I do not see why they are entitled to it.

27,802. Have you read the report of the Royal Commission on Markets and Fairs?—I think I read it at the time.

27,803. Do you think it would be right where a large corporation like Manchester or Liverpool has bought market rights at an enormous price and provided very large markets for the accommodation of the public they should be deprived of the rights they have bought?—I do not think a competitor in that case would have much chance. I do not see why a corporation should have privileges which a private trader has not. A man who goes and opens a tremendous building like the Bon Marché at Brixton must face private competition. That concern came to grief some time ago, and I do not know whether it has been revived or not, but the man who started that would have had no compensation if another man had set up an improved mart opposite to him and done things better and taken away his trade and ruined him.

27,804. The market rights do not belong to the local authorities at Brixton; it would be a question of a private owner there?—Of course, and I do not see why a corporation should have any special privilege.

27,805. You have not read the very voluminous evidence upon the matter given before the Markets and Fairs Commission?—No, I do not think I read through the whole of the evidence; but I cannot see why a person owning a market at Bethnal Green, we will say, should prevent the people in the Great Eastern counties, if they wish to have a market open at Stratford, from doing so.

Free sale of improvements.

27,806. With regard to the free sale of improvements do you propose that that should be substituted for the claim of the tenant under the Agricultural Holdings Act?—Yes.

27,807. I think in the Bills that have been brought in it is given as an alternative that the tenant may choose whichever course he prefers; you would prefer to have it in substitution altogether? You would do away altogether with any claim against the landlord, and would allow the tenant merely to get what he could in the open market for it?—Yes; I think that is fairest for the landlord as well as the tenant; the only objection is, as I said before, that it involves a certain amount of continuity of tenure, or fixity of tenure, and that it also involves a certain amount of valuation of rents in certain cases at any rate.

27,808. Then you would agree that if the tenant got no bid in the open market for this free sale of improvements, the landlord would have to pay him nothing?—I think not.

Protection.

27,809. I think your objection to protection is that it would raise prices, and that the result would be that rents would be raised and the tenant would not get the benefit ultimately?—That was the reason I gave, I did not say that was my only objection to protection, but it was the reason I gave for its not being sufficient remedy for agricultural depression.

27,810. That is the reason you gave, I think, against it?—Yes, as a remedy for agricultural depression.

27,811. Would not the same argument apply to any artificial means of raising the price of agricultural produce?—I do not think I advocate any artificial means; I advocate the removal of artificial impediments.

27,812. If you had any legislation which had the effect of raising the price of agricultural produce, do you think the result would be that the benefit would go to the landlord and not to the tenant?—There is no doubt it would go partly to the landlord. I do not think it would to the same extent as protection, because we saw in the old times when protection existed, there was such a mad gambling spirit introduced, especially when the sliding scale was on; people thought that wheat was going to be at a fabulous price, and they would give anything for land almost to get it, and a great many farmers in those times were ruined through their recklessness. I think protection, especially when there was a sliding scale, when everything was so extremely uncertain as to the price, induced a gambling spirit amongst the men who wanted land, and had an effect which no other advantage would have.

Mr. W. E. Bear.
5 July 1894.

27,813. But any system which had the effect of suddenly raising to an unknown extent the value of agricultural products, would, you think, have the same result?—I do not know of anything that is likely to raise the value of products suddenly or very greatly.

Bimetallism.

27,814. Is that not urged on behalf of bi-metallism?—Yes, I think that in all probability the introduction of bi-metallism would be the means of raising prices.

27,815. Thereby raising rents?—Unquestionably rents would be raised.

27,816. Why do you think the tenant would get a larger proportion of the benefit in that case than he would in the case of protection?—I do not think there would be the same hope inspired among the farmers. I think the farmers have an exaggerated idea of the effect of protection, and that they would not have any exaggerated idea of the effect of bimetallism.

Abatements of rent.

27,817. I think you object to the principle of temporary abatements, do you not?—Yes, I think it is a mistake to give them. I think when they are wanted at all, as a rule they are wanted permanently. At any rate I object to the principle of going on giving abatements year after year.

27,818. But you would not think it wrong to give them in exceptionally bad seasons like the last two?—There is nothing wrong in it. What I object to is these abatements being given year after year instead of a permanent reduction, which would inspire hope in farmers.

27,819. Do you think it is common for these abatements to go on for a great number of years?—It has been the case.

27,820. Do you not think that they more frequently take place in bad seasons?—On the Duke of Bedford's estate, for instance, there has been an abatement made year after year, almost every half year since the depression commenced, but there has been very little permanent reduction, and I believe the old tenants' rents have not, as a rule, been reduced at all.

Market gambling.

27,821. I think you say that American farmers, as a body, are thoroughly convinced that the option system lowers prices?—So far as I have observed, they seem to be pretty well unanimous on the point.

27,822. Have you seen the Report of the Select Committee on Depression in Agriculture in the United States, and the questions they sent round to the farmers on that point?—I have not seen the Report of the Senate Committee, but I have seen some of the evidence which was brought before it.

27,823. They sent round to over 200 farmers a number of questions, one being, "What effect, if any, have dealings in futures and options had on the prices of farm products?" Have you not seen the answers to that; they are in a volume I have here?—I do not think I could have seen them, but I have seen some of the evidence collected by the Senate Committee.

27,824. I understand that 96 were of opinion that the system lowered prices, but that 110 either said that they knew nothing about it, or made no reply, or said the gambling had no effect, or else thought that it raised prices; but you were not aware of that?—Were they farmers?

27,825. These were all farmers in the corn-growing States. Twenty said they knew nothing about it; 38 omitted to reply to that question while they answered the others; 41 said the gambling had no effect; and 11 said it raised prices. I have not analysed the figures myself, but I believe they are correct?—The farmers' associations in America have declared most strongly against the option system, and all the great organisations have gone strongly against it.

27,826. I suppose that committee would select the most typical farmers they could send the questions to, would they not?—Yes, they might.

27,827. They published this in their evidence?—I should have thought they would choose the most typical

Mr. W. E. Bear.
5 July 1894.

farmers, unless the question has been tampered with in some way.

27,828. We cannot assume that?—No, we cannot assume it, I am afraid; but still it is a strange thing that all the public utterances, all the farmers' newspapers, and all the farmers' associations, so far as I have seen them in America, are strongly against the option system.

Valuations and free sale of improvements.

27,829. (*Mr. Gilmour.*) Do I understand you to say that you consider it impossible to put a fair value upon tenants' improvements by valuation?—I think it is extremely difficult, when a man has been on a farm 15 or 20 years, to value all the gradual improvements he has made, particularly as the most important improvements on a farm are made where a man has been farming well year after year, and has gradually raised the letting value of the farm in a way in which it would be very difficult for him to put down the actual improvement.

27,830. Then the object of free sale is to obtain as high a value as possible for these improvements?—It is more to obtain what I consider to be just, what the farmer can fairly claim, neither more or less. If he has spent the money injudiciously, the market would very soon tell him that he had been doing so, and he would find that he had not nearly so much to take as he expected. Under the present system he very often does claim an extravagant sum from the landlord, but as a matter of fact the landlord generally goes one better by making a bigger counter-claim, and so it is defeated in that way, but it is not a nice state of things.

27,831. Do you think these men who would bid at this free auction would be practical men?—My idea was not that there should be an auction at all. I think that a man, when he was going to leave, would go amongst those whom he thought likely to take on the farm, get them to see it, and explain to them all about it, and so gradually make a bargain with some one.

27,832. Would the man who bought be bound to be accepted by the landlord?—Not if he could be shown to be not a solvent man, or was in any way a man that could be reasonably objected to from a business point of view; then the landlord would have a right to appeal to the court against his entrance.

27,833. But virtually the selection of his successor would be in the hands of the outgoing tenant?—Yes, it would, so far as he selected a man who was fit to take the post of tenant.

27,834. And unless the landlord chose to take it into court, the tenant would be the judge of whether the man was a fit tenant of the farm or not?—Unless the landlord appealed, yes.

27,835. Do you not think that the result of that would very likely be to lead to quite as much litigation as there is at present under the Agricultural Holdings Act?—No, I do not think there would be very much litigation. I think, as a rule, that the tenant would be very careful not to sell his tenant-right to a man who was not pretty well up in his finances.

27,836. An outgoing tenant would have no further object than simply to get payment for this; he need not care a button about what was done to the farm afterwards?—No; he would of course leave the landlord to the protection of the law, which I should give the landlord against a man coming in and deteriorating his land.

27,837. This arrangement of yours was to go on for seven years, I understood?—Yes, but the landlord would have the power under the draft Bill that I supported of appealing to the court to restrain a tenant, or to fine him possibly, or on a repetition of his offence to cause him to quit the farm if he were persistently deteriorating the farm.

27,838. How do you think these people, who have to settle whether the farm is deteriorated or not, can come to an idea of what has been done to the farm, if you consider that it is almost impossible to value your improvements?—Of course there would be the evidence of local men, who could give evidence to the effect that this man was doing certain things which were known to be injurious to the land, and there would be possibly men to certify that they knew that the land had been made very foul; for instance, that a field which was clean before had been made very foul by repeated cropping without cleaning the land.

27,839. Could that not be done in the same way in valuing an outgoing tenant's improvements?—As I have said, there is a great difficulty in valuing the gradual improvement which a tenant makes on the land. I think we see that now; the outgoing tenant's covenants are very often valued in a most unsatisfactory manner, and when you come to valuing improvements extending over 10 or 15 years I think the difficulty comes in to a much greater extent.

Mr. W. E. Bear.
5 July 1894.

The scheduling of farms.

27,840. Do you think that the proposal to schedule every field at the beginning of a lease—at any rate in countries where leases hold—would be of any practical good at the end of 19 or 14 years?—It would not be a very exact thing, but I think it would give a good picture of the farms if you had every field scheduled, and the condition it was in, as to general fertility and freedom from weeds, or a statement of what weeds prevailed in it, if there were any at the time. I think that would have a certain value as a guide in the second valuation.

Butter making.

27,841. (*Mr. Whitehead.*) You told the Chairman that there had been an improvement in butter-making in this country; may I ask if that has been general throughout the country?—It has been spread about very much by the work of the dairy schools. Take the mere fact that you saw something like 100 girls—I forget how many there were, but I think there were over 100 girls—at the last Dairy Show, ready to come and take their stand in public and make butter in a manner that was highly creditable. I suppose there was hardly one there who did not make butter fairly well. Compare that with what would have been the case 10 years ago, when you would have had a difficulty in getting a dozen, and you must see the degree to which good butter-making is extending throughout the country.

27,842. Do you think the improvement is due to the education that has been given to the tenant farmers and their wives?—I think it is due to the education which has been given through the dairy schools.

27,843. Chiefly by the action of the county councils?—Chiefly by the action of the county councils during the last few years, but it began before the county councils were in existence, I think.

87,844. In what way did it begin before they were in existence?—I think Bath and the West of England Society had a travelling Dairy School for instance, and I think there were a few others. In Ireland certainly the work of dairy education was going on some time before through two excellent schools.

27,845. I think you say it is necessary to have co-operation in order to establish factories to make butter of a uniform quality?—I think so.

27,846. Before we can hope to compete successfully with foreigners?—If you are going to oust the foreigner I think you must have butter of a uniform quality sent to the shops week after week.

Agricultural education.

27,847. With regard to agricultural education generally, do you think county councils are working in the right direction in that respect?—I think county councils have wasted a large portion of the money in lectures, which, in my opinion, are the least effective way of teaching.

27,848. Would you advocate more practical teaching?—I would advocate classes in the place of lectures. I think a man goes to a lecture one day and does not go the next day; then at a lecture a man cannot interrupt the lecturer when he wants to ask a question, but he can in a class.

27,849. Do you think that farmers generally need technical education?—I think it is a very good thing to train the young farmers, but as far as adult farmers of this country are concerned I think I should have left them alone. I should not have tried to teach them by lectures or anything else much, because I do not think they will learn. I think they are indisposed to learn as a rule. I think it is the young man you want to get at.

27,850. You think the older men either will not learn, or that they are beyond teaching?—I think they are beyond teaching as a rule.

27,851. Not that there is no necessity for teaching them?—They have their own opinions.

27,852. I think you have had a great experience with regard to small holdings?—I have been amongst them a good deal, and tried to study their advantages and disadvantages as well as I could.

Mr. W. E. Bear.
5 July 1894.

27,853. Might I ask in what part of the country especially you have studied the question?—I have studied it in all the counties I went to as Assistant Commissioner to the Royal Commission on Labour; and I have also been on Lord Tollemache's estate in Cheshire and seen them there, and in the Isle of Axholme.

Large and small estates.

27,854. I see in your brief you say that, on the whole, your experience leads you to conclude that both farmers and labourers, and indeed the entire rural communities, are better off on large estates than on small ones?—Yes, I believe they are. I was certainly very much struck on going on some of the large estates; it caused me to form a higher opinion of the great landlords than I had entertained before.

27,855. Were they managed better, and managed under one uniform system?—The thing was managed on a more generous system than where there were just a few small owners

27,856. Yet may we take it that small holders have done, as a rule, better than large holders?—I have never said that.

Large and small holders compared.

27,857. May I ask what your opinion is upon the general question?—I do not think that small holders have done better, as a rule, than larger holders, except by getting their sons to work for them for nothing.

27,858. Do you think that is the only gain that there has been?—I think that, as a rule, is the only gain there has been. If you take the two systems I do not think, as a rule, you will find that small holders will cultivate their land as well as large ones—not where they engage in ordinary farming. I see in Austria that the statistics for 1893, published by the Ministry of Agriculture, represent the average yield of corn produced on the large estates as considerably greater than it is on the small holdings.

27,859. You would not recommend the system of small holdings then as a remedy for agricultural depression in this country?—I should not recommend it as a general rule; I should like to see small holdings increased as far as they are likely to pay, but I do not believe in any artificial means of increasing them, and I think it would do a great deal more harm than good. I would give them free play to extend as far as they can in the trading and agricultural districts.

27,860. You think every facility should be given for their extension?—I would give them every facility, but I would not bolster them up with State funds—I do not believe in that.

Rates.

27,861. I think you have not been asked any question as to the unfair incidence of local taxation, although you mention it in your brief; would you give shortly what your opinion is as to the unfair incidence?—Of course there is no doubt that local taxation is levied on real property only and not on personal property; that is the main injustice.

27,862. (*Mr. Dalton.*) Does it not fall on a considerable amount of personalty—railways, canals, waterworks, and so on?—Only so far as they have land or buildings. In the case of persons who have got personal property connected with land and buildings you cannot separate the rates which are on the land from those which are on the buildings.

27,863. (*Mr. Whitehead.*) Has local taxation increased on the whole, do you think, in the last 20 or 25 years?—No; I should say that rural rates have rather decreased than otherwise.

Rural depopulation.

27,864. I think you said in answer to a question from the Chairman that there had not been a depopulation in the rural districts with which you are well acquainted?—I said the depopulation was very much less than it had been represented to be.

27,865. In the last census I think there is shown a very large depopulation in the whole of the agricultural districts?—The census shows very much less than I expected to see.

27,866. You are speaking of only two or three special districts I take it?—I am speaking of the districts visited for the Labour Commission. I see that Mr. Little has summed it up. I think out of 38 districts there are 21 in which the decrease in 20 years has been over 5 per cent. and only 15 in which it was over 10 per cent., while in two it was under 1 per cent. So that the great majority of those 38 districts have a decrease of population in 20 years of only between 5 and 10 per cent.

27,867. Yet we have been told by most witnesses that it is very difficult to get young men to stay in country places, as they are attracted to the towns; is that your experience?—Yes; where I have been the best young men left for the towns and left the inferior young men and the old men behind them.

Mr. W. E. Bear.
5 July 1894.

27,868. Therefore there has been a depopulation?—There has been a depopulation to a certain extent; I have never disputed that, but it has been less than people have talked about when they have talked about the rural exodus.

27,869. Has it interfered with the agricultural labour market?—I have not been in any district where the supply of labour was not sufficient at ordinary times. I think it has been a very fortunate thing for the labourers that they have been able to find occupation elsewhere

Market monopolies.

27,870. Mr. Channing asked you a question as to the markets, but I did not quite gather from your answer what you proposed as to the establishment of markets?—I would not have a market prevented from being established by the existence of a charter held by a corporation near by.

27,871. Your objection to markets is that there is a certain charge or toll, is it not?—There are charges of course in places like Covent Garden.

27,872. Would that not hold good just in the same way if private markets were established?—That was not the objection I raised; the objection I raised was to the fact of their being too much centralised, so that the produce came to London and was afterwards distributed to other towns, and also to the fact that the monopolies of these markets gave to salesmen in them a great power which they would not possess if there were free trade in markets.

27,873. Do you think that affects prices?—I think the rings of salesmen prevent people from getting fair prices for their produce, and from getting the price which their produce actually realises.

Co-operation.

27,874. I think you said that the remedy is co-operation amongst agriculturists for buying and selling?—I should like to see that tried.

27,875. In what way could they co-operate to establish markets?—I think they could co-operate very effectually, not so much for the purpose of establishing markets as for the purpose of selling to retailers direct without going through the London salesmen.

27,876. Do you know that that has been tried in several places and has not answered?—I have never seen a really good attempt at agricultural co-operation on a sufficiently large scale yet.

27,877. I suppose you know that it is difficult to induce farmers to co-operate?—I know they are extremely difficult to persuade on that point.

27,878. That would be a great objection, would it not?—That would be the great hindrance to its being tried. I advocate co-operation, but I have no sanguine expectation of seeing it carried into effect in my lifetime.

Sale by live-weight.

27,879. (*Sir Nigel Kingscote.*) I think in your brief you attach some importance to the selling of cattle by weight?—Yes, I think it is a manifest advantage to farmers which they have been extremely foolish not to take the benefit of.

27,880. Then you think the farmer would benefit by it?—I think he would unquestionably benefit by it, but he is so well opinioned as to his own powers of making a bargain that he does not see it.

27,881. Would you go so far as to wish to see it made compulsory in markets?—No, I would not make it compulsory, certainly not. If a man does not like to take advantage of the benefits placed at his disposal he must lose.

27,882. Would you like to see a weighing machine at each market to be used at each market?—The market authorities are bound to provide a weighing machine, but the farmers do not take advantage of it.

27,883. (*Mr. Giffen.*) Is there not some difficulty about having proper machines for weighing?—I think there has been dissatisfaction among the farmers, and they have disputed the accuracy of some of these dial machines, but still I do not think there has been much occasion for that.

27,884. Do they think the machines are not arranged to weigh accurately enough?—They may have raised that objection, but I do not think that has been the

chief objection; I think the chief objection has been the opposition of the butchers and dealers, who have done all they can to prevent farmers from weighing; then of course the auctioneers have had pressure put upon them by dealers and butchers. I believe that has had a great deal to do with the non-success of it. On the other hand, there is the prejudice of farmers against anything new at all, and their thorough belief in their own power to make a bargain.

Free sale of improvements.

27,885. (*Sir Nigel Kingscote.*) I think I have gathered from your evidence that one great thing that you wish to see done, if not the greatest thing, is that the tenant should have the right of free sale?—Yes, that is one of the chief things.

27,886. Do you not think, from your experience, that if that was carried out that would entirely alter the position of the landlord?—Yes, there is no doubt it would make him a kind of sleeping partner.

27,887. Do you think that would be beneficial to the country throughout?—Yes, I think it would be better than having agricultural improvement in the position of a man between two stools. I think as it is now the tenant is always waiting for the landlord to improve, and the landlord has no interest in improving, because he knows that too much of his property will go to his heir as it is, and he wants to save what he can for the younger children.

27,888. Then I am afraid what you have given us in evidence goes against what you have written here in your brief: "As a rule, however, I hold the landlords "and farmers may be left to attend to their own affairs, "provided that the State secures to them perfect "justice and freedom in the pursuit of their business." It strikes me whether free sale would not be very much in the tenants' favour, and whether the expression that you have used, that the landlord would be a sleeping partner, would be completely carried out?—I would leave them to settle their own affairs as long as there was no injustice to any members of the community, but I think when there is any injustice perpetrated the State must step in. I think there has been an injustice in the case of tenants' improvements.

The currency.

27,889. (*Mr. Giffen.*) With regard to what you call the artificial competition of producers in certain countries, such as the Argentine Republic, in consequence of the deterioration of currency, I should like to ask you whether you are of opinion that that is a permanent advantage which the producers in those countries have, or whether it only exists during a period of transition?—I do not see how it can well be thoroughly permanent, but it is astonishing how long it seems to last in some countries; for instance, the Indian cultivator has had an advantage in exporting, from the depreciated rupee, for, I suppose, the last 10 years or more.

27,890. And in the Argentine Republic?—In the Argentine Republic I should think it must be shorter lived; I cannot imagine this gold premium keeping up for as long a period as 10 years.

27,891. Still it has lasted for a long time?—The gold premium has been, I suppose, from 150 to 300 per cent. for the last six or seven years.

27,892. It has got worse instead of better?—It has, and they are talking about a fresh issue of paper at the present time.

27,893. With regard to Russia, something of the same kind might be said, might it not?—Yes, the Russian rouble, I suppose, has a conventional value pretty much as ever, and it has depreciated in gold value to a great extent.

27,894. Do you not think that the advantage tends to disappear very quickly, whatever the advantage may be, and that prices and wages adjust themselves to the deterioration of the currency?—I do not think they do; I know that it is the theory of the economists that they ought to, but I do not think they do in a country like India, for instance, much more than the value of glass beads among the savages of Africa.

27,895. I should like to put to you one or two questions following that up; one point I should like to put is this: do you think that a country where such a deterioration of the currency exists gains as a whole by the deterioration in its trade with foreign countries supposing it imports as much as it exports?—I should not think that the country gains as a whole; I cannot imagine that it does as a whole; but I think the people who have to engage in the export trade, and I should think possibly a new country mainly consisting of men who are producers, might gain as a whole; but I should think that a country containing a large number of capitalists who have money to invest would be losers.

Mr. W. E. Bear. 5 July 1894.

27,896. The advantage is this I suppose, that the producer or the exporter, or whoever he may be—some person engaged in the business—gets a larger quantity of currency in exchange for his bill upon a gold country where the produce is to be sold in consequence of the deterioration of the currency?—Yes, of course.

27,897. That is the nature of the gain to the exporter?—Yes; for instance if he can buy four dollars for four shillings now, whereas he only got one formerly, and the dollars go as far in buying land and in paying for labour, or very nearly as far, in paying for labour, not quite, as they used to, it is very obvious that he can undersell people who are less favourably circumstanced.

27,898. That is the nature of the gain?—Yes.

27,899. And it would follow from that, that people who import goods into a country of that kind would be at a disadvantage in precisely the same way?—I do not know whether they would in precisely the same way. I suppose that people who imported goods would buy them in gold and would have to charge a profit upon them.

27,900. The people who buy the goods with currency would have to give more currency for the goods which people had bought at gold prices?—Yes.

27,901. The two things balance each other—if there is a gain to the exporter in the way that you describe there must be a loss to the importer in the same way exactly?—I do not know that it would be in the same way. Probably he would find the demand very much less because he would have to charge such a very high price for the things he sold, but he would take care to get his profit.

27,902. The importer gives a certain sum in gold for his goods, and that gold commands a larger quantity of currency; is that not the position?—The importer would have to provide a larger quantity of currency in order to buy his goods, but he would demand his profit in reselling what he imported.

27,903. Still as far as the currency operation is concerned, the advantage to the exporter is balanced by the disadvantage to the importer, and if the imports and exports balance each other there is no gain to the community whatsoever, as I rather think you intimated was your opinion?—I do not think there would be any gain to the community at large, but of course in a new country, a country like the Argentine Republic for instance, the imports would be very much less than the exports.

27,904. With reference to the stimulus, if there is to be a stimulus at all in the matter, I suppose it would be a stimulus to the producer, because he is the man who brings the goods into existence?—Yes.

27,905. Would I be right in saying that as far as the producer of agricultural produce is a consumer of his own produce, there is no advantage to him in the matter from this deterioration of the currency?—As far as he is a consumer, to that extent of course there is no advantage.

27,906. There could be no advantage?—There could be no advantage as far as he is a consumer.

27,907. And as far as he is a consumer of goods which are imported, there would be no advantage to him because he pays proportionately more just as he receives proportionately more?—Yes; but then a cultivator of the soil in the Argentine Republic would be a man who would buy next to nothing of imported European goods.

27,908. Are you quite sure of that?—These poor Italians, who have been used to living almost like beggars in their own country—and the majority of them are Italians, men who came out almost without a penny, and men who toil from early morning till late at night, and live in an extremely economical way—I should say that their purchases of European goods would be extremely small.

27,909. But, as a matter of fact, the imports of the Argentine Republic consist very largely of goods which are destined for consumption, do they not?—I have not examined the character of the imports.

Mr. W. E. Bear. 5 July 1894.

27,910. A large part of the consumption of the people of the Argentine Republic is the consumption of imported goods; but you have not looked into that point?—I have not looked into the character of the imports particularly.

27,911. At any rate, as a matter of principle, so far as the consumption of imported goods is concerned, the producer of agricultural produce in the Argentine Republic loses upon what he imports what he gains upon what he exports *pro tanto*?—Yes, but the man who sells the produce of his farm gets an amount which is of course very much greater than the amount that he spends; what he spends on imports, comparatively speaking, is a mere trifle.

27,912. So far as the consumption of goods which are produced in the Argentine Republic of a similar character to those which the agriculturist himself produces, that is to say, any goods which may be exported, though they do not happen to be the goods of the particular producer, he would also lose upon what he consumes, *pro tanto*, as much as he gains on what he buys?—The producer would lose on what he consumes.

27,913. Suppose the producer of wheat gains upon his wheat, and has to purchase beef or mutton, he would lose upon the beef or mutton what he gains upon the wheat?—I do not see that.

27,914. Because the beef and mutton are also articles which are exported, and which, by your statement, have risen in price in consequence of the deterioration of the currency?—As I have said before, the quantity the farmer consumes of the things that he produces is so small in proportion to the total production that he sends away, that it is a mere trifle to him.

27,915. Still it is a question of degree?—Yes, but the degree is so enormously disproportionate.

27,916. The other outlay of the producer in the Argentine Republic, I suppose, would be for wages?—Yes, the chief outlay would be for wages.

27,917. If wages were to go up in proportion to the fall in the currency, then the producer would have had no advantage whatsoever?—On the interest on his purchase of land, or on his rent, if he pays rent, he would get an advantage from the depreciated currency; I mean to say land commands no greater number of dollars now than it did before the depreciation took place—so Mr. Gastrell says.

27,918. Still, if rent forms, strictly speaking, no part of the cost of production, but is something over after the cost of production has been met, that hardly enters into the question, does it, as a stimulus to production?—I should consider that rent formed a proportion of the cost of production.

27,919. So that when we come to analyse it in this way I do not quite see what the advantage to the producer in the Argentine Republic, or in any country with a deteriorated currency, happens to be?—If a man produces a hundred pounds' worth of wheat in a year, and he himself and his family eat only about five pounds' worth, and if he produces a hundred pounds' worth of meat, and they eat another five pounds' worth of that, the advantage seems to me to be very great. He only pays the premium on these small amounts, that is to say, they make no difference to him on these small amounts; but on the other things which he purchases, which would be on that scale if they came from Europe, he might have to pay more money.

27,920. But still I have enumerated all the different kinds of things that he must consume, and I think I have covered everything that he must consume, and he must lose upon what he buys just as he gains upon what he sells?—He must lose upon what he buys if it happens to be imported from gold countries.

27,921. As far as a certain part of his production is concerned, he neither gains nor loses, because it is not sold; but as far as the remainder is concerned he must lose upon what he buys as much as he gains upon what he sells?—I contend that what you call the remainder is a small fraction.

27,922. Even after the payment of wages?—In wages he gets the advantage at present.

27,923. Have you followed that out in detail with reference to the wages in the Argentine Republic?—I only go by Mr. Gastrell's reports on the question; he allows a certain advance in wages in currency, but he says it has been very small at present.

27,924. I do not think he goes into it very much in detail, he does not give you particulars of wages year by year in different districts?—No, he has not gone into it to that extent of detail, but he has given a table of wages in the report which he published in the autumn of 1892, I think; not the last report he published.

Mr. W. E. Bear. 5 July 1894.

27,925. Do you think it conceivable that if the currency has deteriorated to the extent of being worth only one-fourth of what it was, say 10 years ago, wages have not risen in some degree in proportion?—I think they have in some degree

27,926. Suppose the labourer in the Argentine Republic 10 years ago was something like at the minimum of subsistence, you cannot cut three-fourths off his subsistence; his wages must rise?—If he does not buy any European products to speak of, as is the case with these labourers, especially the coloured people, the Peons.

27,927. Is not almost all the clothing imported?—I suppose a good deal of the clothing would be.

27,928. Is not the furniture imported?—I do not know. I should think they have precious little furniture; many of them live in huts.

27,929. Still, whatever furniture there is, I believe it is all imported, or nearly all?—Yes.

27,930. Still, you are not acquainted with the nature of the imports into the Argentine Republic?—No, but I know that the amount which the farmer spends on imported goods must be extremely small in proportion to what he sells off his farm.

27,931. Now, take the case of India again, where the depreciation of the currency has been nothing like so great as what it has been in the Argentine Republic; has there, as a matter of fact, been any stimulus to the production in India by the deterioration of the currency?—Yes, I think so. I do not think the ryots would have been able to go on growing wheat at the prices which have prevailed in Europe if they had not been paid about the same number of rupees that they used to have in former times.

27,932. If they get the same number of rupees that they used to have, but do not get more, where is the stimulus?—You want no better stimulus than the old prices used to be; the old prices were a sufficient stimulus to all farmers everywhere.

27,933. Still we find with the prices as they are now, wheat is not coming quite so freely from India as it used to come?—No, the price is too low even for them.

27,934. The price is just about the minimum, and has never been very much higher?—Prices have been too low in Europe even for India with this advantage.

27,935. Still, what is the stimulus; that is the difficulty which I have?—I say that it has been sufficient to enable them to keep on exporting where they would not otherwise have been able to do it.

27,936. I can quite see that that is a relative advantage perhaps, compared with a producer in a country like England, where the real wages of labour have increased, but a relative advantage does not appear to be a stimulus?—I have no particular preference for the word "stimulus"; as long as you will admit that it is a means of enabling people to keep on exporting, where they otherwise would not be able to do so, that is quite sufficient. If a man can only get a little profit by growing wheat, he will keep on growing wheat.

27,937. But still, is not the real difference between this country and India a difference very largely arising in this way, that the real wages and the real remuneration of the agricultural labourer and the peasant in India have not improved in the last 20 years, but the real wages of the agricultural labourer in England have improved enormously; would that not make a difference?—I do not think it makes sufficient difference.

27,938. Then you are not very much in favour of bimetallism as an immediate remedy, I understand?—I have never declared myself a bimetallist. I have only studied the question as far as the agricultural imports into this country are concerned, and I am perfectly convinced that the depreciation in the currency in countries like India and the Argentine Republic has had an enormous influence upon prices in Europe.

27,939. Have you considered the question whether bimetallism is a possible thing or not?—I have not

Mr. W. E. Bear. 5 July 1894.

gone thoroughly into the subject; I do not think my opinion is sufficiently worth being placed on record before this Commission considering that you have examined experts on the subject.

27,940. But you say that if a practicable scheme were brought forward you would like to see it tried?—I would like to see it tried.

27,941. That means that as yet you have seen no practical scheme, does it not?—I have not seen an exact scheme at all. I suppose the nearest approach to a scheme is that the nations of Europe, or rather the civilised nations of the world, should confer together, and fix the ratio between gold and silver. If they could do that, and would do that, I should like to see it tried very much.

Protection.

27,942. Then I gather that you are not much in favour of a countervailing duty against the bounties which certain countries give at present, because the emergency is not very great, and you do not see that it would do much good?—The bounties on exports are not on a sufficiently large scale to justify Parliament in legislating on the subject. I should not like to advocate a countervailing duty, because it would create a tremendous stir, and there is so little importance in it at present. It is only the Government of Victoria and New South Wales, I think, who are paying bounties on dairy produce.

27,943. Have you looked into the question carefully whether countervailing duties are ever efficient for the purpose for which they are intended?—No, I do not think I have examined the question in the light of experience. I do not know where I could find the experience.

27,944. Might I suggest to you that there was some experience of countervailing duties or something analogous to them about 50 years ago in this country in reference to sugar, when differential duties were put on the import of sugar, into this country to benefit our colonies for having free labour against other countries which were supposed to have a bounty in their favour in consequence of having slave labour; that that was tried for a great many years, but that the differential duties were given up in the end because they were found not to answer; you are not acquainted with experiences of that kind?—I had forgotten it if I had ever heard of it. I think in all probability that a countervailing duty would very soon knock the bounty on the head in the case of Victoria and New South Wales, and I think that if we were to threaten such a thing, even they would immediately take off their bounties. But I do not want to lay any stress upon that, because it is a small thing at present. It is an unfair thing to English producers that the foreigners should have a bounty, and that a foreign Government should pay part of the expenses of a business rival.

27,945. Why should not a foreign community combine to sell things at a price that suits them, and not leave it altogether to individuals?—I think if they are not to be blamed for doing it we could not be blamed for preventing it.

27,946. We may blame them for doing it because it is unwise, but it may also be unwise in us to try to prevent it in that manner?—It might be unwise as it is a small thing, but if it were a big thing I should think it would be wise.

27,947. Still there might be a great many things that would require to be considered in practice when the question of countervailing duties came up as a practical queston?—No doubt there might.

Market gambling.

27,948. Then with reference to this question of the effect of dealing in futures as depressing prices of agricultural produce: could you give us any idea of the extent to which you think prices are depressed in consequence; is it a serious matter?—It is impossible to judge to what extent the system has depressed prices. It is quite easy to imagine when there is a large supply of corn what a free play people of this sort have if they sell nominally for future delivery on a very large scale at a low price, and then they have got a great deal in their favour, and they are almost safe to keep on selling at a low price for nominal future delivery.

27,949. I gather from you that the chief characteristic of the market is that people sell largely what they have not got?—Yes, that is it.

27,950. They have a large interest in depressing the prices in consequence?—Yes, I think that the enormous offers of wheat, although it is fictitious wheat, must have an effect upon the market.

Mr. W. E. Bear. 5 July 1894.

27,951. You have not considered the question whether if that is the case the same effect would not be produced upon the Stock Exchange markets, where there are large sales of articles which people have not got?—I have been told that the exact equivalent of the option system did not exist on the Stock Exchange, but I do not know what goes on on the Stock Exchange.

27,952. I have been quite unable from the evidence which we have already had to observe any distinction between speculative sales in these produce markets and speculative sales upon the Stock Exchange; and I should rather like to ask you if you could tell us what the distinction is?—I should say that if you were to get a hundred people suddenly going on to the Stock Exchange and selling fictitious Great Northern shares and so reduce the quotations of Great Northern shares, that would have a deteriorating effect upon those shares.

27,953. But the general experience of the markets is that sales of that kind being compensated, and perhaps more than compensated, by purchases in the opposite direction have no such effect as you describe?—It is a known fact that when the option dealers want to lower prices, and when they conspire together, perhaps two or three large firms would have what they call a wash sale if they could, and sell furiously on the market, which would send prices down for the day at any rate.

27,954. I suppose that would have a great immediate effect, but it might not have very much effect upon the average prices over a considerable period?—It might not if they could not keep it up, if they could not keep on sending the prices down.

27,955. Would you be surprised to be told that I have known cases on the Stock Exchange of outstanding sales for delivery of a particular stock exceeding the quantity of that stock by two or three times?—Of course that is nothing compared with wheat.

27,956. That is the very case which you suggested of sales of the Great Northern stock which people did not possess?—I do not understand it. I should imagine that a constant selling of stock which did not exist must have a tendency to lower the price of the stock.

27,957. Not if there are people who are buying it in the same way; how could it depress the price if there is somebody to take it?—I suppose it might in that case be because there is no such thing as the oversupply of a stock which pays interest. It does not matter how much there is of it so long as it keeps on paying interest, but in the case of wheat to create an idea of an extensive supply which does not exist makes people think they are going to get it very cheaply, and disposes them to bid less and less for it. It destroys confidence in the possible rise in prices.

26,958. It would operate on men's minds for the moment perhaps, but the real conditions of supply and demand would hardly be affected by fictitious sales of that kind?—I cannot help thinking that they are. If they were conducted outside the market I should not say they were, but they are actually conducted in the market which makes the prices; these fictitious sales are what make price quotations in America.

27,959. We have been told that a great many of these fictitious sales are sales of articles in which the producers themselves are not concerned, and that the greater part of the wheat for instance which is produced is not wheat that is tenderable in these markets?—No, that is the great mischief.

27,960. How should the sale of articles which people have not got, and which are not of the same kind as the articles which are really dealt in by buyer and seller, have so much effect upon the buyer and seller to the alteration of the laws of supply and demand?—That is the very great mischief of the system, there is only something like 10 per cent. of the wheat in America which is sold in the option markets at all, and this 10 per cent., with the fictitious sales which go on in connection with it, fixes the price for the 90 per cent. remaining.

27,961. But why does not the real holder keep back until he gets from the real buyer the price which the supply and demand would dictate, why should they

Mr. W. E. Bear.
5 July 1894.

care for what the speculative people are doing?—They are the only price quotations, you can only sell your wheat at the market price. This is the best wheat, No. 1 and No. 2 wheats are those that are dealt in, and it is the inferior wheats that do not come up to the standard of No. 2 which cannot be sold by options.

27,962. But you are not obliged to sell on a particular day, and if the price does not suit you, you wait for a day or two days, or a week, till you get a price that does suit?—The price that does suit you eventually perhaps does not come in those days.

27,963. The reason of that must be that the real purchaser, the real consumer, does not come forward to buy; there would be no use in his going into the speculative market to buy, because he would not get the article he wants?—There is a certain amount to be bought in these markets of course. You can go into the markets and buy any amount of real corn, but you can only do it at the price fixed by this option system.

27,964. We are told as a matter of fact that there is little actual corn?—Little actually goes there, but you can go there and get it.

27,965. The dealings are in an article which is not really in existence, and the wheat which is tenderable at the market we are told is such a small portion of the total wheat produce?—It is; it must not be below the grade No. 2. But still you cannot suppose that anyone is going to give more for No. 3. if there were such a thing—of course no one would give so much for it as he would for No. 2; so that these people who are outside the option markets are still ruled by them in the price.

27,966. I will give you the case of an actual producer and an actual consumer willing to come into contact, the consumer wanting the stuff and the producer having got it to sell; why cannot they make a bargain quite irrespective of the speculative gambling in an article which does not concern them?—They can if they like, but the buyer says to the seller, "Your wheat "grades below No. 2, and I am not going to give you "more for it than," he says, "the market price for No. 2."

27,967. As a matter of fact he can get wheat?—He can get it.

27,968. (*Mr. Dalton.*) Any quantity?—I do not say any quantity, but he can get as much as he wants as a rule. I have never heard of there being any great dearth of No. 2 red wheat. It comes to this country to a very great extent, and of course it would be retained there if they wanted it.

Mr. W. E. Bear.
5 July 1894.

27,969. (*Mr. Giffen.*) But you can give us no idea of what the depreciation in consequence of the option system amounts to?—It is impossible to say what the depreciation is.

27,970. We were told by a witness that it was the difference between 40*s.* and 24*s.* per quarter; I suppose you would hardly agree with that?—Certainly not; that would be to attribute the entire fall in price to options, which of course I am very far from doing. I maintain that the main cause of the fall in prices is the over-supply in recent years.

27,971. Then it would not be so very important to the farmer to prohibit these dealings in futures altogether; would he gain a couple of shillings a quarter by it?—I should think he would gain a great deal more than that. I should think wheat has depreciated to a very great extent more than 2*s.* a quarter through the option system at the present time. I do not believe it would ever have run down below 30*s.* if it had not been for the option system.

27,972. Would it be a difference of 10*s.* a quarter?—I do not know, it is not down to 20*s.* yet fortunately.

27,973. Or 5*s.* a quarter?—It is impossible to say what it is. I do not believe, speaking roughly, that wheat would have been below 30*s.* if it had not been for the option system. In this country I do not believe our average would have been below 30*s.*

27,974. Then there is something like 5*s.* a quarter due to the option system; would that be a fair thing to say? I should not like to pin myself to any precise sum, because no one can possibly tell; still I do not believe wheat would have been anything like the price it is now, because I do not think the surplus has been sufficient to justify the extremely low prices.

27,975. It is largely a matter of guessing on your part, not a matter of exact estimate, that this has been the result of the option system?—It is impossible in a case like that to fix a figure.

27,976. If your theory should happen not to be well-founded, that estimate would fall altogether?—Of course any estimate falls if the theory on which it is based is proved to be not well founded.

27,977–29,977. I merely wish to have it put on record that you go by theory altogether, and that you have not made any calculation of the degree of the effect?—There are absolutely no means of making the calculation.

The witness withdrew.

Adjourned till to-morrow at 12 o'clock.

Fifty-first Day.

Friday, 6th July 1894.

PRESENT:

The Right Hon. GEORGE JOHN SHAW-LEFEVRE, M.P., in the Chair.

Viscount Cobham.
The Right Hon. Baron Rendel.
The Right Hon. Henry Chaplin, M.P.
Sir Robert Nigel Fitzhardinge Kingscote, K.C.B.
Robert Giffen, Esq., C.B.
Charles Isaac Elton, Esq., Q.C.
Captain Owen Thomas.
Francis Allston Channing, Esq., M.P.
John Clay, Esq.,
Cornelius Neale Dalton, Esq., C.B.
Robert Lacey Everett, Esq., M.P.
John Gilmour, Esq.
William Cutlack Little, Esq.
Walter Hume Long, Esq., M.P.
Herbert Lyon, Esq., *Secretary.*
R. F. Crawford, *Assistant Secretary.*

Mr. H. H. Scott. Mr. Henry Hall Scott called and examined. *Mr. H. H. Scott.*

July 1894. 6 July 1894.

29,978. (*Viscount Cobham.*) I think you come here as the representative of the Newcastle Farmers' Club?—Yes.

29,979. You are yourself a practical farmer?—I am. I have farmed all my life.

29,980. Occupying a large extent of land in Northumberland?—Yes, about 8,000 to 10,000 acres.

29,981. And you have a further occupation in Scotland?—Yes, jointly with a nephew I occupy about 17,000 acres in Scotland.

29,982. In addition to those qualifications, will you state what public posts you hold?—I happen to be a county alderman, and chairman of the Roads and Bridges Committee of the County Council of Northumberland; I am also chairman of the Blackwell Colliery Company, chairman of the Bolsover Colliery Company, and a Guardian of the Poor of Rothbury, and I am Chairman of the Whittingham Highway Board, as well.

29,983. All in Northumberland?—Yes; except the collieries.

The depression in the North of England.

29,984. Can you give us your view of the history and progress of agricultural depression in the North of England?—In my opinion, it began to a less or more extent in 1875; the first signs of it were seen then. Ever since it has continued, with the exception perhaps of 1882 and 1883, when there was a boom in the prices of stock, caused no doubt by replacing the many sheep that had died in England from liver fluke about the year 1879 to 1880, I think.

29,985. Has the depression become more intense since that period?—The last two or three years—the last two especially—have been the worst in my recollection.

Low prices.

29,986. To what causes do you attribute the depression?—Not only the agricultural products of the world are greater than there is any demand for, but prices have been forced down to such an extent at home that we, as practical farmers, find ourselves perfectly unable to produce crops or live stock at the prices which we can obtain for them. We produce at a loss.

Results of farming.

29,987. Is it your conviction that no farmer pure and simple can live at the present range of prices?—My experience is that farmers, as a rule, at present are losing money. Perhaps I might mention, in regard to myself, I happen to keep books, and last year, I paid no income tax. I showed that I had made no money on all this land of mine, and paid no income tax at all. So I was losing the interest of perhaps 15,000*l.*, and had a loss of several hundreds besides.

29,988. You would not go so far as to say that there are no men of exceptional ability, or exceptionally placed, who are not making a profit?—I would go so far as to say that the exceptional ability would not save them from loss, but there may be certain positions or certain circumstances in which some men may be making a profit. But I would not say that ability would save them; it would have to be circumstances, such as position or some particular industry.

29,989. Are you well placed yourself with regard to markets?—Yes, we have a pretty good market at Newcastle, and we can also send to Edinburgh.

29,990. How far are you from Newcastle?—The nearest farm is 34 miles distant.

Effect of the depression.

29,990A. What has been the effect of the depression upon the tenant farmers?—The effect has been the melting away of their capital to a considerable extent, and I believe myself that all farmers, pure and simple farmers, who have no other source of income are poorer men now than they were some years ago, and of course some have been ruined.

29,991. What district are you competent to speak of?—All Northumberland, I may say, and of course I know a good many of the counties in Scotland as well. But I suppose I am giving evidence mainly on Northumberland.

Large and small farmers compared.

29,992. Has there been much difference in the effect of the distress upon large and small occupiers?—I have considered that point, and I do not think that there is much difference. It is more a question of capital and skill and application; when a large farmer has those he does as well as the smaller one. I may say, however, that I am quite convinced that there is a smaller yield per acre from small tenancies than there is from the large; whether that is from want of capital or not I do not know—probably from want of capital.

Small holders.

29,993. Do small holders pay wages to their families?—No, they do not pay their families any wages as a rule, but they must give them some money and they have to feed and clothe them.

29,994. But not the market rate of wages?—No. Of course it looks well in theory, a working man and a working family, but I do not think it is taken sufficiently into account that all the members of the family have to be clothed and fed; and it is only if these members are content to live on less, or work more, than a hired labourer that a small tenant with a working family is in a better position to meet depression.

29,995. Are the smaller holders fairly well fed and clothed?—No, I think that the small farmers feed themselves much worse than the hinds do, and they work very much longer hours; that is where there is any success—they work tremendously long hours, some of them I should think 12 to 15 hours.

29,996. And their families?—Yes; in these cases of course they do succeed in living, but they are very saving. I am thinking of a neighbouring small farmer; he does not even get a newspaper into his house, he is so saving, and his family and himself seem to be working at all hours whilst there is daylight. Of course he is making a living.

Mr. H. H. Scott.

6 July 1894.

29,997. When you say small holders, what limits of acreage do you refer to?—He might not be considered a very small holder in the South of England; he has I should think over 200 acres of not very good land, but it is at a small rent.

Condition of the labourers.

29,998. You would call the farmer of 200 acres a small holder?—Yes, when the land is not good.

29,999. What is the position of the agricultural labourers in Northumberland at present?—Agricultural labourers are very well employed; in fact there is rather a scarcity of labour in Northumberland. The mines compete with the farms for labour very much. The agricultural labourer is very well paid. In the North of England at present, counting his house and garden, and perquisites, he gets from 23*s.* to 24*s.* a week, as far as I can calculate it, and he gets that wage continuously—that is, he gets it whether he is well or ill, in bad weather or in good weather, and he gets it all the weeks of the year, so that he is pretty safe.

30,000. An ordinary labourer?—I am talking of the hind, an annual labourer who is hired by the year, he gets his wages continuously whether he works or not.

30,001. Has he to pay a house rent?—He pays no house rent, and he has generally a nice garden. I am including in his wages all his perquisites. He gets a thousand yards of potatoes in addition to the weekly wages. I should think his weekly wages will average 17*s.* 6*d.* a week; his house and garden probably 3*s.* or 3*s.* 6*d.* a week.

30,002. Twenty-three shillings or 24*s.* is the total value of what he gets?—Yes; he has a thousand yards of potatoes, which is worth perhaps 1*s.* 6*d.* a week included.

30,003. Is the quality of the labour as good as it used to be?—The amount of labour which they do? I think it is not quite as good. Each labourer does not do as much work as he did 30 years ago. The hours are a little shortened, not much; but I do not think the amount of labour done per man is quite as much, consequently the labour bills are rather increased of late years.

30,004. Do you agree with one of our witnesses, that physically they are not quite so good as they were owing to the change in their dietary?—They do not diet themselves so well. They have given up the use of oatmeal porridge very much, or oatmeal bread, they drink more tea, and they have not, unfortunately, got cows now, and a very small quantity of milk is consumed now in their houses. I think, on the whole, I am very sorry to say so, that they have deteriorated in stamina, both men and women, especially the women. The women work in the fields there, at least some women work in the fields; they get 3*s.* a day for 20 days in harvest and 1*s.* 6*d.* per day during the rest of the year whilst they work.

30,005. Are they constantly employed all the year round?—Generally; on good farms they are employed nearly every day. Some farmers that are very saving men employ them less regularly. Having been connected with the coal trade, of course, if you liked, I could compare the agricultural wages with the mining wages.

30,006. Are the mining wages sufficiently high to be a constant source of attraction?—They do attract them very much, because they look very big per day. A miner's wage is something like 6*s.* 10*d.* per day; if he was working full time, say 5½ days, it would be 37*s.* 7*d.* per week, but the fact is that he does not work full time, for it is found that through strikes and bad health and one thing and another, he only works four days in the week, or rather less than four, but I have put it at four, so that his weekly wages would be 27*s.* 4*d.* against the 23*s.* 6*d.* of the hinds.

30,007. And he has to pay house rent?—No, I am putting it on the same basis; he has to pay house-rent in the south, but not in the north. But it is not so well even as that for the agricultural labourers who go to the mines, although they do not know it until they go. Very few of them are ever able to become getters of coal—hewers—and they are only bankmen or labourers about the collieries, and those men only get from 3*s.* 6*d.* to 4*s.* a day, so that instead of this 6*s.* 10*d.* that they go for, they find when they go to the collieries that they are not nearly so well off. At the same time I do not say that many of them come back. They get unfitted for agricultural labour after they have been at the collieries, and they do not come back.

Mr. H. H. Scott.

6 July 1894.

30,008. Should you say that the position of the agricultural labourer has improved in the last 15 years on the whole?—Yes, the cottages have been very much improved indeed; they are very good cottages generally and the agricultural labourer is very comfortable Some of them make large wages and get a lot of money into their houses when they have got a working family. I have known a householder for himself and family get over 200*l.* a year into his house, but they do not make much provision for old age I am sorry to say, although they do get this money into their houses. In fact, the family who had the largest income of any family I have had in my employment, and who got considerably over 200*l.* were the most in debt of any family I have ever had, so that the amount of wages does not seem to govern expenditure.

30,009. I gather that wages have remained much the same, but the quality of labour is not quite so good?—The wages went up very much in the prosperous years of 1871 to 1874. They went up 20 per cent., then they gradually fell until 1888, for the next 14 years they came back again, and now they have been rising since 1888, but they have not reached the figures of 1871 to 1874. The labour bill may have reached the same amount that the labour bill did in 1871 to 1874, but the amount per man has not reached the same figure.

Condition of cultivation.

30,010. What is the condition of land generally throughout Northumberland compared with 15 years ago?—There is a good deal of land gone out of cultivation which has been sown away to permanent pasture. Some of it, a good part of it probably, is inferior land, I daresay it is not very profitable, but it is less unprofitable than it was as cultivated land. The cost of sowing away land deters tenants very often from doing it. The cost is considerable when it is laid away in a good way, by a good method, probably 6*l.* or 7*l.* an acre, so that tenants who have used up their capital should not do it—it is too expensive to do. I have known some tenants who have got poor by cultivation entirely ruined by embarking on laying away their land to grass, because the expenditure was considerable and the quantity and the quality of the grass as grown first, perhaps, during from three to ten years, is neither very great nor very good.

30,011. Are the landlords generally ready to find the seeds?—A great many landlords do find the seeds, but the cost of the seeds is rather the smaller part of the expenditure, because the land to be a success should not have a corn crop probably the year it is sown away; there should be no corn crop with the seed, and it should be afterwards manured with bones or other manures, so that the seed is rather a small part—it does not count for much; the seed is not equal to more than 20*s.* an acre; you can get very good seeds at 20*s.*

30,012. And it should be very lightly stocked for some few years?—Yes. Eaten with cattle it recovers more quickly than when eaten with sheep. Probably, one reason why there are so many good old pastures in England is, that in the days they were sown away there was more cattle and fewer sheep.

30,013. Is there any land quite out of cultivation?—No, not at all. It is all in grass or in cultivation. There is none out of cultivation with us.

30,014. Has there been any deterioration in the quality of farming in Northumberland?—Yes, I think there has to a certain extent. As the farmers have grown poorer they have perhaps been less inclined to spend money over their farms in keeping up the condition; in fact they cannot afford to farm so high probably now as they could when things were at better prices.

30,015. Have fences gone back to a notable degree?—No, I do not think they have very much. I do not think that Northumberland was ever very famous for keeping up very nice hedges. We find that good tall rough hedges are an advantage in breaking the cold winds in that neighbourhood.

30,016. Has there been much change in the method of cultivation?—There is not much change in the methods of cultivation; there is a certain substitution of oats and barley for wheat, but I do not think there is much other change. And with regard to changes of tenancy, there have not been many in my district. The landlords are very merciful in not turning tenants out, no doubt. I have never known poor tenants go out of their own free will (unless they are turned out) till they know where to go to get a home to cover them,

Mr. H. H. Scott.

6 July 1894.

so that the poorer a tenant is the more likely is he to remain in, unless he is put out.

High farming.

30,017. Do you think the farmers have been discouraged from pursuing a system of high farming by their recent experience?—Yes, I think they have. Speaking from my own experience, and from the experience of others, I think that high farming does not pay so well as it did; in fact it is very doubtful now whether it pays better than low farming. Probably there might be more money to lose by high farming, because there might be a loss on the natural production of the soil, and there might be a further loss on the additional production obtained through outside foods and manures, so that the loss might be increased. I may say with regard to myself, I find I expend in artificial foods alone 1,800*l.* or 2,000*l.* per annum. At one time, when prices of stock were good, I do not think there was any expenditure I made that yielded me more profit than that expenditure on artificial foods; but now there is no direct profit from it, and last year I make out there was a loss from it. There may be an indirect profit, to a certain extent, by the benefit the consumption is to the farms, but there is no direct profit from it. Last year I think was a clear direct loss.

30,018. Probably the best farmer is the man who is able to hit the happy medium?—I have not decreased the quantity very much that I use, but I am very doubtful about the profit in it now.

Artificial foods.

30,019. There has been a considerable fall in the prices of artificial foods, has there not?—There has; they are very moderate in price at present, but still not sufficient to meet the great fall that has taken place in corn and live stock.

30,020. You would not be satisfied with merely getting the manure for your expenditure on goods?—No, it is rather a small profit, the manure, and it is an undefined quantity; it is so difficult to make out.

Foreign competition.

30,021. What do you think are the main causes of depression as affecting Northumberland?—I think that the main cause, the greatest cause, is foreign competition. I daresay there are other causes, but I think that is one of the great direct causes at present. The quantities sent are so large that they force down prices to such an extent that we cannot grow the crops at the price.

Bad seasons.

30,022. Do you agree with previous witnesses in thinking that the price of agricultural products all round has fallen, roughly speaking, something like 30 per cent.?—Yes, 35 per cent. I should put it at.

30,023. Have you suffered from unfavourable seasons to any great extent?—I think the seasons since 1874 have not been very good, but I do not think that that is one of the main causes of the depression. The drought last year forced down prices for the time very much indeed, because there was no food to keep animals, and they were sent into the market to be slaughtered; but possibly we may get a little good from that at some future day; there may be a little boom in replacing these animals that were sold.

30,024. Has that not already begun in the prices of store stock?—To a certain extent, probably.

Labour.

30,025. Have you anything to say as to contributory causes?—There is a contributory cause in the supply of labour. As I have said, it is rather scarce in the north; we find that our labour bills have increased of late years.

30,026. Do you find that the cost of production has actually increased?—Yes, the cost of production has rather increased.

30,027. Do you mean absolutely or relatively to the profits made?—The cost of production of late years has increased. I do not think the cost of production is greater now than it was in 1871 to 1874, but it has increased since 1888.

30,028. We are comparing with 1883, generally speaking here?—1883 was one of our good years. That was the year when the replacing of the sheep that died of the liver fluke took place, and it was rather an exceptional year. I should think, as compared with 1883, the cost of production is not much different; the cost of production is rather greater now, but not to a great extent.

30,029. You say that your labour bill has gone up, but not to any great extent?—That is so.

30,030. Have you estimated how much per acre, or what percentage?—No, I have not got the figures here.

30,031. Could you say roughly that your labour bill has gone up 10 per cent?—Since 1888, labour has gone up quite 10 per cent. In 1888 it was about its lowest point, I think.

Mr. H. H. Scott.

6 July 1894.

30,032. Then in what other particulars has there been an increased cost of production?—I do not know that the cost of production in other respects has increased. Of course, I have mentioned wages that are rather higher, but I might say, I think it is proper to say, that we do not think that low wages are good for agriculture. We think that high wages over the country are the best thing for farmers, because low wages mean low prices, and low consumption, and high wages we think mean high consumption.

30,033. Although labour has increased, the prices of artificial foods and of manures have considerably diminished, have they not?—Yes.

30,034. Has there been an increased use of machinery for saving labour in your district?—Yes, there has been increased machinery used in saving labour, except in regard to ploughing. At one time we had a number of steam ploughs, but they have almost disappeared.

30,035. They did not pay, in fact?—No, they have disappeared out of the county almost altogether; there are one or two only left, I think, but at one time we had a great number.

Rates.

30,036. Are your rates diminished?—The rates are not diminished. The rates are rather increased, in some respects, but we get subventions from the Government at present, which keep them about stationary; but I think the cost of paupers and lunatics has rather increased.

30,037. Do you think the burden of rates upon agriculture generally in Northumberland has increased, or not?—I think not, on account of the assistance of these subventions that we get from Government for roads.

30,038. What has been the average fall in rents in Northumberland?—I think about 22 to 25 per cent.

Cost of production.

30,039. Then, notwithstanding that you have gained in the matter of rent and artificial manures and feeding stuff, you still think that the cost of production has increased I hardly follow that myself?—I was thinking of the cost of cultivation per acre, when I said the cost of production. The cost of beef and mutton could not be increased, because they depend to a certain extent on the price of artificial foods.

Rates.

30,040. Have you any opinion to give about rates and taxes and their incidence?—There are certain new rates and taxes, but they are balanced by the subventions or assistance we get from the Government at present. We get the spirit duties and some other duties.

30,041. Have you any recommendations to make for a change in the mode of assessment?—I should think it most desirable that the landlord should pay half the rates, as the landlord does in Scotland, so that there would be a community of interest, and things would run much more smoothly. In Scotland, it is always that the landlord pays half and the tenant half, and I think it would be a great improvement if it was done so in England. I have found, at meetings where expenditure was discussed, the landlords all voting one way, and the tenants who have thought that the expenditure affected them particularly, all voting in the other way. It is a pity such a thing should be, because the rates might be equally divided, and then there would be a community of interest, and things would go smoothly.

Farmers' capital.

30,042. You think that farmers in Northumberland have lost a good deal of their capital?—I think they have.

30,043. But they go on farming?—Yes, as I said, the poorer they get they are more likely to go on unless they are turned out.

30,044. You have not received any considerable importation of men with capital in Northumberland?—A good deal of new capital has come into farming no doubt, in Northumberland, because a deal of money has been made at other industries, and the sons of rich men sometimes come into farming. But, unfortunately, that capital is not always put to the best use or applied in the best way, for it seems rather to be the opinion of moneyed men that if they have an idle son, or a son who will not apply himself to other work, he is good enough for agriculture, and is sent to it, and consequently the results are not what might have been expected.

Mr. H. H. Scott.

6 July 1894.

Burdens on land.

30,045. What do you consider are the main matters of complaint that are put forward by the chamber that you represent?—I, perhaps, might say that we think that land is unjustly burdened on account of the old state of matters, when there was an import tax on all that was imported of agricultural produce at the expense of the other classes. That import tax has been abolished, but the burdens on land remain all the same. At one time it might be quite right that land should be taxed as it is, but we hold that it is not right that it should be taxed now, when the import duties have been done away with.

30,046. Would the farmers you represent generally revert to Protection?—No, I do not think the Farmers' Club, as a rule, would. Of course there are Protectionists amongst the members of the Farmers' Club, but I do not think generally they would revert to Protection.

30,047. But you think they should be relieved from charges which they had to pay when they were protected?—They think it is hard lines we should have all these charges which were imposed in olden times when we had protection, and which were imposed evidently because we had protection.

30,048. What charges in particular are you referring to?—For instance, the poor rates, road rates, school rates—all these rates; they are all upon the land. As far as I know, personalty or shipping, or anything of that kind, does not pay any of those rates.

30,049. Land and houses?—Land and houses pay, but personalty seems to escape. There is also shipping.

30,050. (*Mr. Elton.*) What about the mines?—Mines do pay to a certain extent; at any rate they are valued.

The Agricultural Holdings Act.

30,051. (*Viscount Cobham.*) Do the Northumberland farmers find fault with the Agricultural Holdings Act, or its working?—They do not approve of it in every respect; I believe myself that it has done a great deal of good in these bad times—that the depression would have been accentuated if there had not been the Act. I think that it has encouraged the farmers to try and keep up the condition of their land, which they would not have done if there had been no compensation at all, and further than that, it has been good for the landlords, because the landlords would now have their land in worse condition if it had not been for the Act, the tenants trying to keep up the condition in the hope of some day getting some compensation.

30,052. You are quite of opinion that an outgoing tenant keeps his farm in a better condition owing to the Act than he would have done without it?—Quite so; but what they complain of is that it is so expensive a process when put into operation.

Official valuers.

30,053. How would you remedy that?—I would remedy that by having official valuators or commissioners, or whatever they might be called—referees—and have certain men appointed for each district, and a court of appeal, so many of these referees meeting together quarterly or so; and the law courts would have nothing to do with it. These referees would save expense, for they would not require much evidence, if any; and I have no doubt that by-and-by their decisions would be perfectly just.

30,054. By whom would they be appointed?—Probably they might be appointed by the county councils of the different counties, to be approved by the Board of Agriculture.

Scheme of compensation.

30,055. Has your club formulated any definite scheme or recommendation?—Yes, they did. After the Act was passed the Farmers' Club elected so many members, an equal number of land agents and farmers, to form a scheme, and they did form a scheme. I have got a scheme here. They tried to do away with the objectionable hard and fast basis on which the Bill was framed by making different classes.

30,056. Is this a scheme for working the Act or for amending the Act?—Working the Act.

30,057. (*Mr. Channing.*) What Act do you refer to, the Act of 1875 or 1883?—The Act of 1883.

30,058. The Act of 1875 does lay down scales, and the Act of 1883 merely lays down the value to the incoming tenant?—Were not the two combined in 1883?

30,059. (*Viscount Cobham.*) At any rate you are speaking of the Act of 1883?—Yes. It was the Agricultural Holdings Act of 1883 that I was thinking of.

30,060. How do you deal with the schedules of the Act of 1883?—What the committee of the club did was this: they had first-class, second-class, and third-class compensation. The first-class was a class where the farm was well worked, and it received a maximum. For instance, taking bones as an example, the first-class exhaustion on each crop was to be one-fifth on arable land and one-tenth on pasture land; the second-class was to be one-fourth on arable land or hay meadow, and one-eighth on pasture land; but the third-class, where the thing was not so well done, where weeds probably took away part of the bones, was to be—exhaustion, one-third on the arable land and hay meadow, and one-sixth on the pasture land; so that the third-class was very much worse than the first-class.

Mr. H. H. Scott.

6 July 1894.

30,061. Has the Act been worked on that basis?—It has been worked very much on that basis. There have been a number of these leaflets of ours giving that scale applied for, so much so that I know the club the other day had to get a new edition brought out.

30,062. Has it given general satisfaction, do you think?—It has given a good deal of satisfaction. I do not think it is sufficient myself, and I do not think the club thinks it is sufficient. I think myself—I do not know whether I can first speak fully for the club in this respect—that there should be more compensation for condition—as to the condition at time of entry and condition at time of quitting, and less for certain acts or for foods and manures purchased. I think that a bad tenant may get too much from the Act, and a good tenant is not likely to get enough. For instance, a good tenant may make the principal part of his expenditure in the first years of his tenancy, and he gets the farm into such good condition that it requires less, say, the last three or four years; therefore, he will get less compensation. A bad tenant might put on very little the first few years of his tenancy, and he might throw on a great deal of manure, and buy a great deal of food the last three or four years of his tenancy; and possibly he might get more compensation than a good tenant.

30,063. Would you have every farm surveyed for incoming tenant and out-going tenant, and the condition scheduled?—That is what I would propose. Before this Agricultural Holdings Act of 1883 I drafted a rough Bill, and that is what I proposed, that there should be valuers for each district. I do not know whether you have seen it; Mr. Colman, the Assistant Commissioner in 1881, I think, approved of it, and appended it to his Report. Mr. Wilson-Fox, the Assistant Commissioner of this year, also refers to it.

30,064. It was before the last Commission, in all probability; Mr. Colman was an Assistant Commissioner then?—Yes, to the previous Commission.

30,065. Are those the two main points on which you would amend the Act?—The Bill proposed that Great Britain be formed into districts, say, for instance, England into 12, and Scotland into six districts, with three arbiters or commissioners for each district to settle all matters as afterwards specified, and a commissioner's office for each district.

30,066. We have it in full on page 439 of the Appendix to Mr. Wilson-Fox's Report to us. Do you agree with it now?—It is my opinion now. The Bill also provided for a court of appeal, the country to be formed into larger divisions, consisting each of three adjoining districts, and the commissioners in the three divisions to assemble quarterly to decide by a majority all appeals from district decisions, and their decisions to be final, and subject to no review by any other court. Then the Bill also dealt with the election of commissioners (under existing circumstances difficult to define)—it was before there were any county councils I wrote this. The amount awarded by the Commissioners either for compensation—this is the main point of it—or depreciation in regard to condition, was not to exceed five years annual rental of the land. The maximum amount, viz., five years rental, might be divided into 25 parts, fixing upon 0 as average condition, so that good condition might be marked to 25, and bad condition to a like figure. That is, each one above 0, opposite good condition would mean one twenty-fifth part of five years rental compensation to the tenant, and like figures marked in the schedule or form opposite bad condition, would mean compensation to the owner for depreciation in the same ratio. The basis for estimating the rental was to be that of the average of the enclosed land upon the holding. After the passing of these laws or rules any owner or occupier was to have power to demand

Mr. H. H. Scott. July 1894.

from the Commissioners an examination of a holding. Owners were to have the preference in erecting farm buildings, but when they were considered insufficient by the tenant, he might erect buildings himself. Compensation was to be given at the termination of the tenancy to the amount which buildings so erected might add to the letting value of the holding, or compensation in the same manner to the landlord to the amount which the buildings might lessen the letting value of the holding. Notice should be given by the tenant to the landlord before he puts the building up, and the landlord might apply to the Commissioners for a prohibition, on the plea that they were not suitable. The owner was to have preference in executing drainage. The Commissioners' powers were not to extend in any way or form to the question of regulation of rents between owner and occupier.

30,067. Is that the opinion of your Chamber of Agriculture, that there should be no outside tribunal regulating rents?—I think that is the general opinion of intelligent farmers all over the country.

30,068. They would be satisfied with some such scheme as you propose?—The farmers want some provision whereby they would be quite sure to get compensation for any improvement they might execute on the holding, and I think they should also be equally sure that they would have to pay for any deterioration that they might cause in the holding.

30,069. (*Mr. Chaplin.*) That is what they really want?—Yes, I think if there were some such plan as I have advocated of carrying the matter out, that it would be a very great reform in farming. It might not in a year or two, but I think by and by, if farmers knew positively that they would be paid for all the good that they did to the place, and that they would have to pay for all the ill they did to the place, there would be a very great reform in farming, and the land would produce more.

30,070. (*Viscount Cobham.*) Farmers with inadequate capital would hardly be able to take much advantage of your scheme?—Talking of the North of England, I do not think farmers have got quite so poor yet, that a good many of them could not take advantage of it.

30,071. Although they have lost some of their capital, you still think they have an adequate amount?—Yes, I think so.

Improvements by tenants.

30,072. (*Mr. Channing.*) Do you wish the tenant farmer to have the right to carry out improvements on notice to the landlord?—On notice to the landlord, and the landlord to have a power of getting a prohibition if they were unsuitable to the holding.

Claims and counter-claims.

30,073. (*Viscount Cobham.*) Would you make any difference in the present powers of making claims by tenants and landlords?—I think it is very unjust that the landlord cannot claim at present until the tenant claims. In that way a bad tenant can easily escape paying any compensation, for he need not make a claim, and the landlord has no power to claim. I think a landlord should have the power to make a claim whether a tenant makes one or not; but I think that the tenant should not require to put in his claim so early. We find it of the greatest inconvenience in valuations for compensation, that the tenant has to put in his claim. I think it is two months before the time of quitting in England, and he really cannot tell what foods or what manures he is going to use up to the day of quitting. I think the landlord and tenant should put in the claim at the same time, and it should not be until the quitting takes place.

The law of distraint.

30,074. As to the law of distraint, what is your opinion about it?—I think that the remnants of it should be entirely abolished. I do not think the results from it are good. I think if a landlord takes a bad tenant, or if he ruins a good one by charging too much rent, that instead of his claim being preferred, as it is to a certain extent still, it should rather be deferred; but I would neither have it preferred nor deferred. I think that the interests of the landlord, the tenant, and the tradesman and shop-keeper, and all should be on an equal basis. Therefore I think the remnant of distraint should be done away. No doubt a tenant would lose a certain amount of credit which he gets at present from his landlord, but that would be well counterbalanced by the additional credit he would have from his bankers and from his friends, so it would be no loss even to the poor tenant.

30,075. Do you not think the poorer tenant in many cases would be cleared off by the abolition of the law of distraint at the present moment?—I do not think so at all.

Mr. H. H. Scott. 6 July 1894.

30,076. Rents would have to be paid to the day, would they not?—I do not think they would have. The shopkeepers and tradespeople are not paid to the day, and there is no reason why a landlord should be paid up to the day.

30,077. Do you think landlords would continue to give three, or four, or five months law as they do at present in many parts of England?—Yes, I think they would, without a doubt; it would be for their interest to do so.

30,078. They would not lose by it, you think?—No, I do not think they would; in fact, it is more a name now than anything else. A good many landlords with us do not take advantage of the law of distraint at all. There the nasty thing is by name, and it breeds ill-feeling, and it is no good.

30,079. In Scotland are rents paid on the day?—No, they are not paid to the day. There are quite as long credits in Scotland as in England.

30,080. You are representing the opinion of the Chamber of Agriculture upon that subject of the law of distraint; is there a strong feeling in Northumberland in favour of the abolition of the law?—I think so, although, as I have said, it is not much in operation in the North of England either; but still it exists. Perhaps I may just now quote an instance, unless I am too lengthened, in regard to myself. The other day I wanted to take some grass land from a tenant who was not able to buy stock himself. I did not dare take this land because I knew he had not a very good landlord, rather a sharp landlord. He wanted the pre-paid rent too. I knew if I took the land and pre-paid the rent, that in the meantime if he went to the wall, I would have to pay the rent over again. So I dare not take the land, and I dare not ask the landlord as to whether he would use me in that manner or not, because it would hurt the tenant's credit, so the field remained unlet.

Railway rates.

30,081. Is there a feeling that railway rates for the transport of agricultural produce are too high in Northumberland?—Yes, there was, and there is still, considerable excitement on that point. There is a feeling that the railway companies have accentuated the depression in agriculture, as well as in other things, by raising the rates instead of lowering the rates when the country thought they should be lowered. We now are paying at least 5 per cent. more for the carriage of live animals than we were paying before the change, but we expected a reduction.

30,082. Is that the nett result of the recent revision of rates?—Yes; instead of getting a decrease we have got an increase. We expected a decrease, but we have got a considerable increase, particularly on live stock. The companies seem entirely to ignore the principle that such high rates of carriage strangle trade.

30,083. Do you think the same result would happen if Parliament took the matter in hand again, or what remedy have you to suggest?—It is very difficult to suggest a remedy. The railway companies manipulate their figures in such a wonderful way, and alter and re-alter them that it is often very difficult to find out what the increase or decrease is. I have worked a good deal in this matter, as I happened to be on a committee of the County Council of Northumberland appointed to inquire into this matter of railway rates; and I found that it was a very difficult subject, because the railway companies were so very much more clever on the subject, and well informed on the subject, than we were, and therefore we were not able to come to such definite conclusions as we should have wished.

30,084. Then have you found that there has not been even a simplification of rates?—That is so.

30,085. Have you any definite remedies to propose?—Of course I, like all farmers, am entirely against foreign imports having a preference with regard to railway rates. They had a very great preference; it is to be supposed they have not now, but as far as I am informed, there is still a preferred rate for foreign produce carried long distances.

30,086. Notwithstanding the law to the contrary?—Notwithstanding the law to the contrary. Perhaps our opinion may not be worth a great deal, but we think that lower rates might pay the railway companies better than the high rates at present charged. We are handicapped against rates over the sea, as the rates on

Mr. H. H. Scott.

6 July 1894.

the land are so very high in comparison with the rates on the sea, and we do not think it is fair when the railway companies have got a monopoly of a country as they have got of the east of Northumberland, that they should charge such high rates. The rates on the land, where there are monopolies, are so very high in comparison with sea rates, where there are no monopolies; the figures are most striking; for instance, if I send potatoes or corn to London, which is one of the great consuming centres, it would cost me 22*s.* 6*d.* a ton, but for potatoes and grain from Denmark to Newcastle the charge is only 5*s.* 7*d.*, from the German ports 6*s.* 9*d.*, and from America 13*s.* 10*d.*, so that the rate I would have to pay to London is far greater than the rate from America or to America, the one being 22*s.* 6*d.* to London, and the rate from America being 13*s.* 10*d.*

30,087. (*Mr. Channing.*) That is not a case of undue preference, is it?—It is not a case of undue preference, but I am comparing the rates on the sea with the rates on the land.

30,088. That is an argument that the rate absolutely is too high?—That is what we think—that it is too high.

30,089. (*Viscount Cobham.*) You have not gone into the question of the relative cost of conveyance by sea and by land, have you?—No; I am afraid that we were not quite capable of doing that.

Malt tax.

30,090. I think you would be glad to see a return to the malt tax?—Yes, I would. I think it would be a very important change for the better if we returned to the malt tax.

30,091. How has the change operated injuriously to you?—Of course it is well known that when it was abolished the farmers were asking for the abolition, but they never contemplated that they would only get its abolition in name, and that, instead of getting the tax abolished, they would get it increased. The only difference made was that in the new way it was levied on beer after it was brewed, instead of being levied upon the barley whilst in the process of malting. Really, there was a very considerable increase, instead of the tax being abolished; the only difference being that it was levied at a different time of the process. I carefully made inquiries, and got the very best authority I could from maltsters, and I found that the increase is really 5*s.* per quarter on home barley, owing to the change from the old malt-tax to the new beer-tax—which is a very serious tax, indeed. For instance, if the land grows four quarters of barley, that is equal to 20*s.* an acre, or the rent of the land which grows the barley.

30,092. (*Mr. Clay.*) That 5*s.* was upon the 56 lbs. barley; it was not upon the cheaper barley?—It was upon the English barley.

30,093. (*Viscount Cobham.*) Do you grow good malting barley in Northumberland?—We grow fair malting barley. There is another disadvantage in the change of the tax, and it is a very great disadvantage to the home grower. Home barley is much heavier than foreign barley, and by the malt-tax the tax was not upon weight but upon measure, and therefore it paid the brewer to buy the home barley, seeing that it was the heavier, and would make the most beer; and there was a considerable preference in that way for the home-grown barley. But the change to the beer-tax did away with all that. Then, by the old malt-tax only malt and hops—I mean no other substance—could be used; but by the new beer-tax many other substances can be used, and they are used; and, therefore, although beer is no cheaper, no less in price to the consumer, it is supposed that it is neither so good nor so pure, because it is made from other substances than malt and hops. To finish, the collection of the beer-tax, I am informed on as good information as I can get, is very much more expensive than the collection of the old malt-tax, and a great many more officers are required. An increase in this tax is a very serious matter for the home-growers. We import from five million to six million quarters of barley per annum, but the home-grown barley is 10 to 11 million quarters, and if there is 5*s.* a quarter reduction in price on account of the change to the beer-tax from the malt-tax, it is a loss of 2,500,000*l.* a year to the home producer, which really may account for a considerable slice in the depression.

30,094. Would you grow more barley if the beer-tax were repealed?—We would grow considerably more barley if we had more favourable conditions. Some years ago barley got so cheap that oats were substituted considerably for barley.

Mr. H. H. Scott.

6 July 1894.

Co-operation.
